XCELLENT OPPORTUNITY FOR anic research chemist Successful candidates l take charge of synthetic organic research tion of well known pharmaceutical house in ndon area Thorough knowledge of organic thesis and experience in synthetic drug field ential Position offers great scope Salary mensurate with experience Pension scheme Apply to Box 634, T G Scott and Son, Ltd , -147 Regent Street, London, W 1

AN ELECTRONIC OR ELECTRICAL EN- eer, between the ages of 25 and 35 years, of ree standard is required to take charge of the ineering department of a factory engaged in manufacture of frequency control equipment successful applicant will be responsible for design and specification of all new items as l as routine engineering problems The posi- offers a wide scope for a person possessing necessary technical qualifications and initiative expand the work along numerous channels uses can be made available to successful appli- ts —Apply in writing, to the Personnel Man- r, Standard Telephones and Cables Ltd , stal Factory, Industrial Estate East, Harlow, ex

HARMACEUTICAL RESEARCH CHEMIST well qualified chemist or pharmacist, experi- ed in research methods, is required by London of manufacturing chemists to carry out in- sting research relating to the development of rmaceutical products Postgraduate research erience would be considered an advantage s is a responsible post, carrying a good salary there is a pension scheme —Applications will treated in strictest confidence and should give details of age qualifications and experience ise address to Box 637, T G Scott and Son, 143-147 Regent Street, London, W 1

TATISTICIAN REQUIRED FOR OPERA- al Research into production control problems a large steelworks in the Sheffield area The k involves variance analysis, etc , of machine aviour, set in the study of stochastic processes flow A knowledge of queue theory is desired the ability to handle time series including -correlation The applicant should be inter- d in the Monte Carlo treatment of synthetic a and in such economic developments as game ory, activity analysis and linear programming she will probably hold, or be about to gain degree in mathematical statistics, and should ly in fullest detail (referring to breadth of rests, and stating salary expected) to the Pro- tion Control Officer, Box 629, T G Scott and , Ltd , 143-147 Regent Street, London, W 1

Advertisers please note You must add " Apply Employment Exchange " unless the employment advertised or the workers required are excepted under the Notification of Vacancies Order

CHIEF CHEMIST WM MOORHOUSE & Sons Ltd , Sunglow Model Factory, Leeds, require Chief Chemist experienced in Preserves or Food Industry, able to take full analytical and quality control Main specialities Jams, marmalades, lemon curd, Christmas puddings, mincemeat, bottled and canned fruits, jellies This is a senior appointment and carries non-contributory pension —Apply, giving full details present appointment, past record, salary required, etc , to Managing Director All applications treated in strictest confidence

DEVELOPMENT ENGINEERS MARCONI'S Wireless Telegraph Co Ltd , Chelmsford, offer the following appointments to the permanent technical staff of the Company These are well paid responsible positions suitable for applicants possessing design and development experience in the following fields

Ref 2120 AIRCRAFT AERIALS Experimental design and development of H F and V H F Aerials Systems Applicants should have had some experience in this field and preferably be familiar with small scale model techniques

Ref 2130 RADIO LINKS Appointments are in connection with the development of U H F and S H F Wideband Multichannel systems Especially suitable for applicants with a knowledge of travelling wave tubes and centimetric techniques

Ref 2140 MARINE COMMUNICATION AND RADAR Appointments available in connection with the development of marine transmitters, receivers, navigational aids and associated equipment

Ref 2220 T V EQUIPMENT Vacancies exist in connection with the development of cameras, studio equipment, transmitters and associated apparatus

Ref 2240 V H F MOBILE EQUIPMENT Appointments available in connection with the design of mobile transmitters, receivers and associated power supplies

All appointments are in connection with the expansion of activities in the Company and carry excellent career prospects for applicants who are able to make an immediate contribution to the work of the Groups Please write giving full details of qualifications and experience and quoting ref SA 55A and appropriate reference number, to Dept C P S 336/7 Strand, W C 2

PHYSICAL CHEMIST (OR PHYSICIST, with knowledge of analytical methods), to take charge of Works Control Laboratory in Hertfordshire, graduate preferred Initial salary approximately £1,000 per annum (according to qualifications for post) Excellent prospects Pension and profits participation schemes —Write full details age, qualifications, experience to date, to Ref P C Box No 8282, c/o Charles Barker and Sons Ltd , 31 Budge Row, London, E C 4

APLIN AND BARRETT, LTD , REQUIRE A Bacteriologist for their Research Laboratories at Yeovil Applicants should hold a degree in bacteriology and chemistry, and some research experience would be an additional qualification The person appointed would be required to undertake fundamental research in addition to work of a more applied nature Salary according to age qualifications and experience —Applications should be addressed to The Director of Research, Aplin and Barrett, Ltd , Newton Road, Yeovil, Somerset

CHEMISTS AND PHYSICISTS ARE REquired for a petroleum research station near London Candidates should be aged 20-26, with first- or second-class honours degrees, and should have fulfilled national service obligations Previous industrial laboratory experience desirable but not essential Good working conditions, non-contributory pension scheme Salary according to age and qualifications —Write, giving full details and quoting H 3028, to Box 7249, c/o 191 Gresham House, E C 2

GRANTS & SCHOLARSHIPS

THE ROYAL SOCIETY

ROYAL SOCIETY AND NUFFIELD FOUNDATION COMMONWEALTH BURSARIES

Applications are invited for awards under the Royal Society and Nuffield Foundation Commonwealth Bursaries Scheme which was instituted to provide facilities for increasing the efficiency of scientists of proven worth by enabling them to pursue research, learn techniques or follow other forms of study in natural science in countries other than their own in the Commonwealth where the physical or personal environment or both are peculiarly favourable The bursaries provide travel, maintenance at a rate of about £600 a year, depending on living costs and the applicant's circumstances and are tenable usually for periods of two to twelve months , they are not intended to provide any salary as such Bursars will not be permitted to prepare specifically for, or to take examinations for, higher degrees or diplomas

Fuller particulars and forms of application may be obtained from the Assistant Secretary, The Royal Society, Burlington House, London, W 1 Applications should be made before March 15, 1955, for proposed visits beginning during the period from July to December, 1955

THE COUNCIL OF SOMERVILLE COLlege Oxford, offers a Mary Somerville Research Fellowship, annual value £350, for three years, from October, 1955, with board and, for a maximum of three terms, residence in College —Particulars of the Fellowship which is open to Oxford women only, may be obtained from the Secretary, Somerville College, Oxford Final date for applications March 1 1955

MISCELLANEOUS

MURDOCH TRUST

For the **BENEFIT** of **INDIGENT BACHELORS** and **WIDOWERS** of good character over 55 years of age, who have done " something " in the way of promoting or helping some branch of Science

Donations or pensions may be granted to persons who comply with these conditions

For particulars, apply to MESSRS SHEPHERD & WEDDERBURN, W S , 16 Charlotte Square, Edinburgh, 2

NOTICE IS HEREBY GIVEN THAT ENDEcotts (Filters) Limited seeks leave to amend the complete specification of Letters Patent No 667,924 for an invention entitled " Improvements in or relating to test Sieves " Particulars of the proposed amendments were set forth in the Official Journal (Patents), No 3440, dated January 19, 1955 Any person may give Notice of Opposition to the amendment by leaving Patents Form No 36 at the Patent Office, 25 Southampton Buildings, London, W C 2, on or before February 21 1955

NATURE

THE LEADING INTERNATIONAL JOURNAL OF SCIENCE

Published Weekly Two Shillings

★

"NATURE" surveys the whole field of pure and applied science, and is authoritative and topical. It is read by scientific workers all over the world.

★

Every issue includes

A LEADING ARTICLE—on science in relation to modern life and public affairs.
REVIEWS—each by an authority on the subject discussed.
GENERAL ARTICLES—surveying new discoveries and developments.
NEWS and VIEWS—on current topics and events.
DESCRIPTIVE REPORTS—of scientific meetings.
LETTERS TO THE EDITORS and SPECIAL ARTICLES—in which scientific workers of all countries of the world describe their current investigations.

A classified list of recent Scientific and Technical Books is included each month.

★

The charges for direct postal subscriptions, postage paid to any part of the world, are

12 months	£6 0 0
6 months (26 issues)	£3 0 0
3 months (13 issues)	£1 10 0

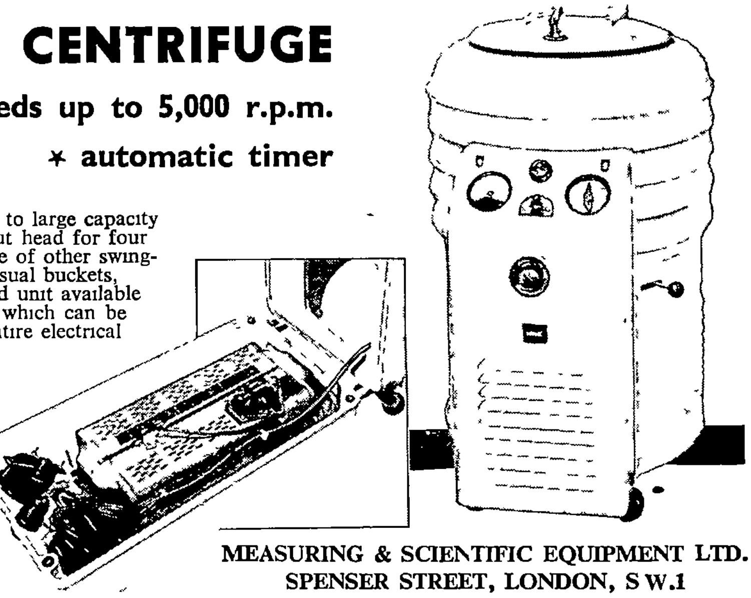
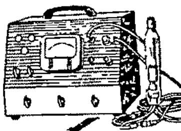
MEASURING & SCIENTIFIC EQUIPMENT LTD.
SPENSER STREET, LONDON, S W.1



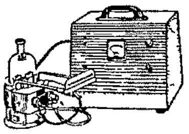
An EVER-INCREASING variety of Laboratories and Factories are depending upon –

THERMIONIC IONISATION
Range 10^{-8} to 10^{-3} mm Hg
Electronic gauge for the highest vacuum measurements

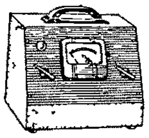


–the world's most comprehensive range of VACUUM GAUGES

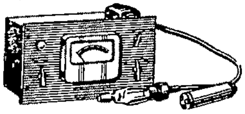
INDUSTRIAL KNUDSEN
Range 10^{-7} to 10^{-4} mm Hg
Developed to a surprising degree of ruggedness. Measures TRUE gas and vapour *continuously*

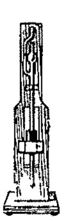


COLD CATHODE IONISATION
Range 10^{-5} to 10^{-3} mm Hg
A less expensive alternative to the more elaborate thermionic gauge



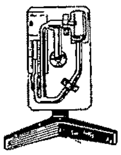
THERMAL-CONDUCTIVITY TYPE
Range 10·0 to 0·0001 mm Hg
The most generally useful gauge. Models available for continuous indication, multi-point recording and battery operation





McLEOD
Ranges 10·0 to 0·00001 mm Hg
Models available, industrial enclosed, rubberless and bench types

MINIATURE McLEOD 'VACUSTAT'



Ranges 10·0 to 0·01 and 1·0 to 0·001 mm Hg
A swivel-operated gauge in forms suitable for Bench, panel mounting and all-glass systems

CAPSULE DIAL GAUGE
Ranges 0–20 to 0–760 mm Hg

ACCURATE MICRO-CURRENT RECORDING

THE UNIQUE *Fielden* WAY

"Servograph" Electronic Single and Multi-point Recorders, Indicators, and Recorder-Controllers all incorporate the unique Fielden working principle and are increasingly accepted as the alternative to complex and expensive potentiometric equipment

ACCURACY

The "Servograph" can be installed as a direct substitute for any moving-coil indicating meter and will reproduce meter accuracy. It remains unaffected by mains fluctuation

ROBUST PEN UNIT

Ample writing power is obtained from the servo loop, thus eliminating pen friction troubles and making delicate balancing and levelling unnecessary, whilst ensuring faithful reproduction of the smallest increments

RANGES

Standard Models are available in three ranges of 50 micro-amps, 1 milli-amp and 30 milli-volts full scale.

Full-scale deflection time with the 1mA model is 1·5 seconds without overshoot

ECONOMIC COST

The ingenious design and execution of the "Servograph" range of instruments permits of their being marketed at a remarkably low figure having regard to their performance. Service and maintenance prove to be negligible

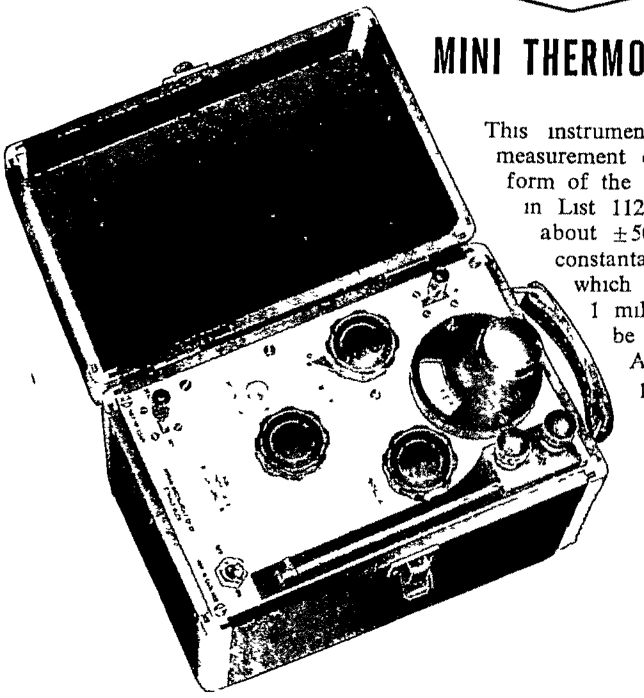
DORAN

MINI THERMO-COUPLE POTENTIOMETER

CATALOGUE NO. E.4221



This instrument was developed in connection with the measurement of temperature in grain, and is a modified form of the Mini Thermo-couple Potentiometer described in List 112 It enables temperature differences up to about ±50° C to be measured using a single copper constantan thermo-couple junction The slide wire which is divided into 100 divisions has a range of 1 millivolt and a single step of 1 millivolt can be added at will by means of a simple switch A metal block and a mercury thermometer provide a suitable reference junction, and a reversing switch permits measurements of temperature above and below the reference junction temperature to be made without touching the connecting leads The instrument is completely self-contained with galvanometer, standard cell and dry battery

SPECIFICATION:

Range	2 millivolts
Weight	8 lb
Dimensions	8¾" × 5¾" × 5¾"

Tel Stroud 462

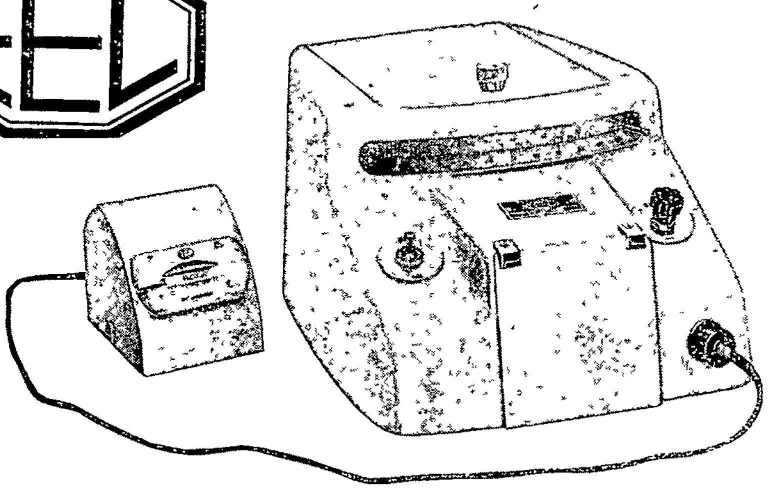
STROUD, GLOS.

London Office
Tel ADD 2369

THE EEL



REFLECTANCE SPECTROPHOTOMETER

This instrument is designed to provide, accurately and rapidly, means of assessing the colour composition of a sample It may be used for measurements on paper, plastics, paints, dyes, inks, etc , and, in fact, on any flat surface. It also enables one to obtain direct readings closely approximating to the X, Y and Z coefficients of the C.I E system.

★ **NINE FILTERS** conveniently mounted in a wheel provide a ready means of measuring the percentage reflectance throughout the spectrum from readings on the 15 cms long galvanometer scale.

★ **GRAPH BOOKS** are available in which these values may be plotted directly on prepared ordinates, giving the spectral distribution curve for the sample relative to the standard

★ **MAGNESIUM CARBONATE** blocks, mounted in holders, are supplied to serve as standard white reference surfaces

★ **TRISTIMULUS READINGS** may be made directly with a special filter wheel which is easily interchangeable with the "Spectrum" wheel

★ **STANDARD CONDITIONS** of 45° illumination and normal viewing of the sample are adopted to avoid errors due to gloss

★ **DOUBLE SENSITIVITY** is provided for accurate measurement of low reflectance values by the removal of a neutral filter from the light beam by means of a hand-operated lever.

★ **VOLTAGE STABILISATION** is provided to correct mains voltage variations of ± 20%.

Full details of this and other instruments will be sent with pleasure

INSTRUMENTS IN ACTION

B.T.L. VAN SLYKE MANOMETRIC GAS ANALYSIS APPARATUS

The photograph on the left is of the apparatus in use at the Chester Beatty Research Institute, Royal Marsden Hospital, for blood gas analysis This instrument is now also in demand outside the biochemical field, where the quantities of determinate are very small Applications of the Van Slyke manometric methods are recommended, for example, in the determination of Amino Nitrogen and Carbon in organic material and the estimation of Carbon Monoxide in air and Carbon Dioxide in aqueous solutions

The Van Slyke Standard Manometric gas analysis apparatus has been completely redesigned to conform to modern practice and the following features are of particular interest

- Glass water jacket is illuminated to give a clear view of the shaking pipette
- Manometer fitted with illuminated meniscus reader for accurate readings
- Easy adjustment of manometer and connecting tubes
- Totally enclosed motor and drive mechanism.
- Rotary rheostat for control of shaking speed from a maximum of 200 per minute
- Timer and alarm buzzer can be fitted as an extra

Price £63 or with timer £73 10s Immediate Delivery Full details will be sent on request

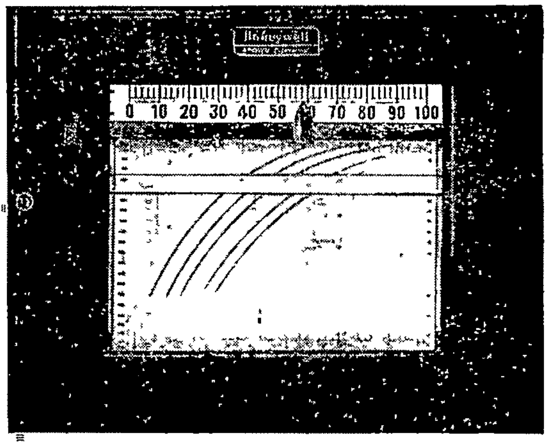
FUNCTION PLOTTER

records y = f(x)



The Function Plotter—curves show relationship between two variables, one as a function of the other

The Honeywell-Brown Function Plotter automatically plots curves showing the continuous relationship of two variables

- **Speed versus Torque**
- **Stress versus Strain**
- **Temperature versus Pressure**
- **Amplifier Output versus In-put**
- **Antennæ Radiation Patterns**
- **Plate Current versus Grid Voltage**
- **Plate Voltage versus Plate Current (and other Electron Tube characteristics)**

The following records are among many which can now be obtained with speed, accuracy, and efficiency

- **Temperature versus Temperature Difference**
- **Hysteresis Loops**
- **Engine Speed versus Governor Position**
- **Pressure versus Displacement**
- **Volume versus Pressure**
- **Force versus Motion**
- **Force versus Displacement**

The Function Plotter is essentially a Single Pen Strip Chart Recorder equipped with two measuring systems The chart is driven up and down in response to changes in one variable and the pen moves simultaneously in response to changes in the second variable A full scale travel of 11 inches is available on both axes Pen and chart mechanisms can be energised by any D C source The Honeywell-Brown Function Plotter is fully described on Instrumentation Data Sheet No 10 0 -5b Requests for this interesting and important 4-page leaflet should be addressed to Honeywell-Brown Ltd, 1 Wadsworth Road, Perivale, Greenford, Middlesex.

Sales Offices located in the principal cities of Britain and throughout Europe

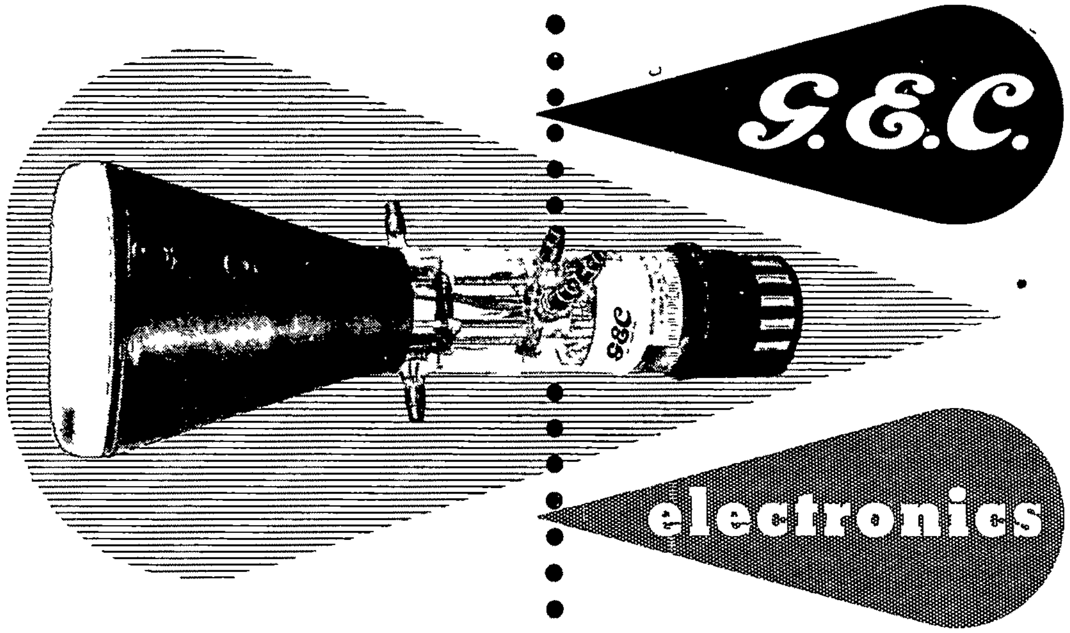
BROWN INSTRUMENTS

First in Controls



Special purpose Cathode Ray Tubes
for Research and Industry

A range of cathode ray tubes is available for use in specialised applications such as the observation and recording of high speed transient phenomena, where the high capacitances and other limitations of the usual type of instrument tube would result in distortion or complete suppression of the trace

Typical applications of these special tubes include high voltage cable testing insulator overload and breakdown testing, cable fault finding by quasi-radar technique and the investigation of high voltage switching phenomena

They are also suitable for use in laboratory oscilloscopes

Brief details of some of the more popular types are given below The tubes are of the all-electrostatic type, with heater ratings of 4V, 1 0A (approx)

401 CAHA
408 CAHA
Rating
Va3 (max) 1 5kV
Vp d a 3 3 5kV
Sx (av) 0 090mm/V
Sy (av) 0 100mm/V
Screen 401 CAHA Green-visual
408 CAHA Killed blue—photographic
Base B9G (pressed glass)

4cm dia high vacuum monitor tubes with one stage of post deflection acceleration For use in laboratory oscilloscopes, multi-channel strain-gauge recording equipment, etc.

908 BCC
Rating
Va3 (max) 10kV
Sx (av) 400/Va3 mm/V
Sy (av) 750/Va3 mm/V
Screen Killed blue—photographic
Base B12D

A 9cm dia flat screen high speed recording tube with a low capacitance deflecting system The connections to the plates and final anode are brought out through side-arms Writing speeds of the order of 30,000 km/sec are possible, and transients of the order of 10^{-9} sec may be recorded

908 CARA
Va3 4kV
Vp d a 8kV
Sx (av) 0 085 mm/V
Sy (av) 0 12 mm/V
Screen. Killed blue—photographic
Base B12D

A 9 cm dia flat screen high speed recording tube with one stage of post deflection acceleration For use where the special features of the 908 BCC cannot be employed to full advantage The Y plate connections and final anode are brought out through side arms

1601 ABC
Va3 (max) 5kV
Sx 660/Va3 mm/V
Sy 1100/Va3 mm/V
Screen Green—visual
Base B12D

A 16cm dia flat screen high speed oscillograph tube The construction is of the low capacitance type with the deflector plates and final anode connections brought out through side arms

1608 BCCA
Va3 (max) 3 5kV
Vp d a 3 (max) 10kV
Sx (av) 0 15mm/V
Sy (av) 0 27mm/V
Screen Killed blue—photographic
Base B12D

A 16cm dia flat screen tube of similar low capacitance construction as the 908 BCC, but with three stages of post deflection acceleration This tube will achieve similar writing speeds and recording periods as the 908 BCC, and is recommended for use where the deflecting potentials available are limited

Alternative screens are available including long after-glow and white and blue aluminised types

Other types of special tubes are available including
Double gun tubes Storage tubes.
Television monitor tubes
Conical deflection systems tubes for radial time bases Monoscopes, etc

OERTLING

Releas-o-matic Balances

Speed with Accuracy

Releas-o-matic

L. Oertling Ltd. CRAY VALLEY ROAD ST MARY CRAY, ORPINGTON KENT

. . you will be interested in this leaflet about the now considerably extended range of *Oertling* **Releas-o-matic Balances.**

They are designed for rapid use — up to 60 weighings per hour are possible—without any fear of damage or early loss of accuracy

Each incorporates the unique Releas-o-matic device which, briefly, removes 85% of knife-edge wear by controlling, **independently of the user,** the velocity of impact of knife-edge on plane at release.

By making rapid weighing safe, the new models help solve the big problem of how to get more weighings in limited space

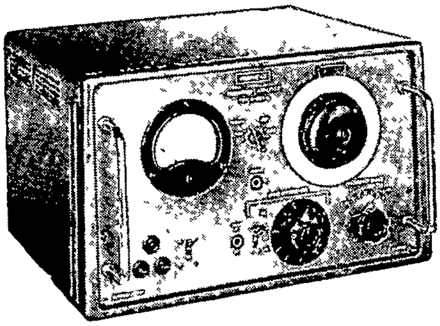
Magslip elements of various sizes for remote indication and control, for computation and summation, and for use in servo systems Motors and amplifiers for servo purposes and other small-power applications

MUIRHEAD INSTRUMENTS



D-669 FREQUENCY ANALYSER

MUIRHEAD

Resistance - capacitance — tuned audio - frequency oscillators, decade and continuously variable, for frequencies from 0.1c/s to 100kc/s. Valve-maintained tuning forks, phonic motors and observatory timing devices Instruments for waveform analysis and vibration measurement

OTHER MUIRHEAD PRODUCTS INCLUDE:—

Decade resistance boxes · Wire-wound resistors · Attenuators · Variable Air Capacitors
AC bridges · DC laboratory equipment · Key and stud switches · Instrument dials and drives
Audio-frequency transformers

Spectrovision reveals new horizons. Much information vital to the chemist is revealed by absorption spectra obtained in the ultraviolet, visible and infrared regions. The tool for this purpose is the spectrophotometer which provides analytical data easily and accurately, speeding research and production and preventing waste. Unicam Instruments of Cambridge will gladly tell you how you may add the faculty of Spectrovision to your present resources.

DIFCO

DETECTION OF THE GONOCOCCUS

The superiority of the cultural method over the usual microscopic technique for detection of gonococcal infections has repeatedly been demonstrated. The cultural method is especially indicated in chronic and treated cases and for determining the release of patients. The use of the following standardized materials has simplified the diagnosis of gonorrhoea by the cultural method.

Bacto-G C Medium Base
Bacto-Proteose No. 3 Agar
Bacto-Dextrose Starch Agar

CONTROL OF TECHNOLOGICAL AND TECHNICAL EDUCATION IN BRITAIN

IN the debate in the House of Lords on December 7 on higher technological education, Lord Salisbury repeated the statement on Government policy already made in the House of Commons earlier that day. The debate arose out of a motion of Lord Glyn in regard to the somewhat disappointing memorandum on that subject drawn up by a sub-committee of the Parliamentary and Scientific Committee, of which Lord Glyn was chairman. Lord Salisbury accepted the main argument of the Committee as to the seriousness and urgency of the situation, and the importance of dealing with the shortage of science teachers and creating a satisfactory climate of opinion in Great Britain in relation to science and technology in order to secure an adequate number of scientists and technologists. Lord Salisbury dismissed, however, as unnecessary the suggestion that any further inquiry should be made into the number of technologists required to meet the needs of various departments of the national life of Britain. He accepted it as sufficient that we are nowhere near saturation point at present, and in this view he had the support of most other speakers, including Lord Baillieu, Lord Glyn, Lord Falmouth, Lord Waverley and Lord Cherwell.

Lord Salisbury, in referring to school leavers, corrected one statement in the memorandum under discussion. Of the 8,000 State scholars, he pointed out, some 5,000, and not 600, are studying science, and many of these would no doubt become technologists. But while he recognized that steps should be taken to see that a good proportion of the best brains are attracted to science, he deprecated the Parliamentary and Scientific Committee's reference to the abandonment of "the arbitrary dictum of the Barlow Committee that the numbers of arts students at the universities should be doubled as well as the numbers of science students". There was no such dictum, Lord Salisbury said, nor did he think that it was helpful to consider this question of balance on a basis of percentages. It might indeed be observed that, in much of the discussion of technological education and of science and the humanities which has marked the educational conferences of the New Year, there has been indifference to first principles. Mark Pattison's discussion of the functions of higher education and of the university, of the importance and value of close interaction between university and society, of the proper subject of university studies, of liberal education and mental breadth has a strangely modern ring. The argument by which he supports his view that the products of a university are not inventions, improvements, discoveries, novel speculations or even books, but the fully educated man, goes closer to the root of the matter than many modern controversialists. The first part at least of his "Oxford Studies" is worth reading to-day for the light it throws on the conditions under which alone higher education in a university can be efficient.

Lord Salisbury, after a tribute to what the University Grants Committee had already done to increase the number of university students of science and technology since the War, stated specifically that, as already implied in Mr. Boyd-Carpenter's statement a year ago, the Government does not intend to pursue the idea of a new technological university but to build up and develop a number of existing institutions where science and technology already flourish and sometimes predominate. Moreover, Lord Salisbury laid some stress on the value of the closer connexion between science and technology which might result from the expansion of technological education in association with that of the universities. The statement which was read in both Houses of Parliament, for example, suggested that students of a particular technology should work closely with students of fundamental science and of its application in other fields. Lord Salisbury himself seemed to favour the close association of higher technological education with other university studies, partly at least as a means of increasing the prestige and status of technology. The complaint was again voiced in the debate that technology, and even science, do not yet receive the prestige and status in comparison with the arts that they should, either on their intrinsic merits or from the point of view of the national interest, to ensure that a sufficient proportion of the nation's ablest intelligence is to be induced to follow careers in science and technology. Some encouragement may well be desirable and even necessary, and particularly efforts such as the Federation of British Industries has been making of late to indicate more clearly and precisely to the schools the opportunities which a career in industry can offer to the graduate in science or technology and its intrinsic satisfactions as well as material rewards.

There is, however, a danger here that the claims of science as against the humanities may be pressed too hard. The function of the university is to produce educated men and women, capable of independent thinking, of sound judgment and wide vision, and the needs of the community will not be served if the conception of the university as a place of vocational training is too narrow, no matter what that vocation may be, whether in the arts, in science or in technology. In terms of modern life, the community is as ill-served by a Civil servant or administrator ignorant of science and unable to assess the significance of scientific or technical factors in a situation with which he is confronted, as it is by the technologist or scientist who is incapable of taking a balanced view and making allowance for the human values and other considerations which should influence the decision even on problems essentially scientific and technical.

This needs to be remembered, for it is the capacity for independent thought, for judgment and for vision that is important: the medium by which that capacity is developed is largely irrelevant. It can be developed as readily by a scientific and technological education as by one in the humanities; but it does not follow that it will be so developed. What matters is not so much the medium as the character of the training; and the prestige of the humanities in this respect is not so much due to their field as such—though they have certain inherent advantages—as to the way in which in certain schools they have been taught.

Lord Salisbury's remarks are not entirely free from danger in this respect, particularly if his statement that the Government has rejected the idea of a technological university should be misconstrued. The Government has declined to found and experiment with an entirely new institution; but when the programme it has announced for the expansion of the Imperial College of Science and Technology is complete, in size of teaching and research staff, in its range of buildings and equipment, the College will clearly be a technological institution of the first rank. Moreover, at the Imperial College real efforts have been made during recent years to encourage breadth of view and contacts between different faculties and studies, though there has been some argument as to whether the influence of humanities is anything like as strong as in the great technological institutions on the Continent and in the United States.

It would be unfortunate, however, if the argument as to whether or not students of technology in universities in Britain get a broader education than those studying in a foreign institute of technology distracted attention from the importance of giving fresh attention to the question not only of how best the sciences and the arts as well as technology can be used as mediums of education for understanding the world in which we live, but also of assisting intercourse and discussion between students of different disciplines and faculties. Unless attention is directed specifically to such questions, there is danger that the expansion of technological education within the universities—at the Imperial College of Science and Technology, at Glasgow, at Manchester and elsewhere—may lead to segregation rather than to the intercourse and the sharpening of minds. Probably here, as the Government statement indicates, the influence of industry could be beneficial. "The problems of industry are problems of human relations, as well as of science, and in training for industry the humanities have an important part to play". Comments made by industrialists at conferences on industry and the universities suggest that the influence of the universities in this respect may be as important as the financial support recently given in the Universities of Durham, Edinburgh, Nottingham and Wales to which the Government statement referred.

Lord Salisbury, however, indicated that the Government is also proposing to develop higher technological education to some extent in the colleges of technology as well as in the universities of Britain; but here he was not altogether precise in his distinction between technological and technical education. Referring to the proposal to develop ultimately some thirty major technical colleges into advanced regional colleges, he agreed that it is desirable to segregate the lower-grade work as soon as possible from the more advanced work, so as to leave the selected colleges with more freedom to provide advanced technology and to conduct applied research. He appeared, however, to accept without question the practicability of carrying out technical and technological education within the same institutions, and he dismissed as unjustified the claim for academic independence for the selected colleges of technology. Sir David Eccles's subsequent proposal that the Salford Royal Technical College should concentrate on advanced work for students more than eighteen years of age and cease to take students under that age suggests that the Minister of Education has at least misgivings on the former point.

The arguments of the Parliamentary and Scientific Committee in regard to the importance of such independence to enable the technical colleges to attract teaching staff of the requisite calibre and to provide the continuity and range of courses were not really examined by Lord Salisbury. He indicated that the Government has rejected the proposal of the Committee to establish a few such selected royal chartered colleges of technology; but, apart from the failure to discriminate, where the technical colleges are concerned, between technical and technological education, his statement, taken with that of Sir David Eccles on December 14, leaves a distinct impression that the Government's policy may spread available resources too thinly where technological education is concerned. That Great Britain can afford the resources to develop more than half a dozen institutions on a scale which will ensure a broad enough training in really well-equipped institutions may be doubted, no matter how generous the co-operation and support of local industry. Indeed, it is to be questioned whether the necessary teaching and research staff for half a dozen institutions could be assembled for several years, let alone for the twenty-four technical colleges in which courses in advanced technology have already been approved for an increased grant. On the other hand, despite Lord Salisbury's admission that five or six technicians and many first-rate craftsmen are required for every technologist, the Government statement will not dispel misgivings that nothing like enough effort is being given to the training of technicians and craftsmen, even to remove the shortcomings disclosed.

The Government statement puts recurrent expenditure on technology at the universities as about £3 million a year, with an increase of some 25 per cent in the next two years, and capital expenditure already incurred of £10 million, and probably a further £15 million over the next ten years. These sums are quite substantial enough to warrant the establishment of a technological grants committee, parallel with the University Grants Committee and similar in status and organization. That suggestion of the Parliamentary and Scientific Committee's memorandum was strongly supported in the debate, not only by Lord Glyn but notably by Lord Waverley and Lord Cherwell. Lord Waverley thought that a body dealing with higher technical education in parallel with the University Grants Committee would serve an extremely useful purpose in advising the Lord President of the Council in a matter which he, and even more emphatically Lord Cherwell, considers quite outside the scope of the University Grants Committee as at present constituted

This proposal, as presented in the debate on December 7, would appear to contemplate such an oversight of technical as well as technological education as would keep the two in balance and assist in gaining for the technical colleges the conditions of service and esteem which they require, no less than finance and equipment, to enable them to do effective work. The mere existence of such a body could do something to increase the esteem in which the technologist and the technician is held, and thereby to remove the friction which has sometimes developed over discussions as to the respective functions of the colleges of technology and the technical colleges Prestige and status are important for other reasons than in assisting the colleges to attract staff of high qualifications and in inducing a sufficient number of the ablest school leavers to take up technological and technical careers It will be of vital importance that the functions and work of the technical colleges should be fully understood and esteemed by the community if there is to be any division of function such as Sir David Eccles seems to have in mind. The work of the technical colleges might well be seriously injured if it were thought that the task of training technicians and craftsmen were less important than, or inferior in status to, the task of training technologists

The proposal for a technological grants committee, if implemented with wisdom, vision and generosity, offers a prospect of enabling this question of the balance between technological and technical education to be handled in terms of the national interest and needs, and of eliminating the distortions which local and sectional interests and prejudices so readily engender It is not easy to over-stress the importance of such an impartial approach, and of avoiding party political prejudice As Lord Rochdale said, the problem of technological education has to be tackled with energy and force over many years, irrespective of the transient condition of trade and whatever political party may be in power at any particular time The Parliamentary and Scientific Committee could render no greater service than by continuing to demonstrate the practicability and value of an all-party approach.

Lord Salisbury, in his concluding remarks, stressed the desirability both of increasing the prestige and esteem in which technology is held compared with that of science, and of breaking down barriers between the arts and science Whether or not the importance which he rightly attaches to this process —and he recognizes it as one which may take generations to achieve—was responsible for his studied disregard of the Parliamentary and Scientific Committee's proposal for a technological grants committee, in spite of the powerful support it received, the proposal should be pressed It merits further examination and should be rejected only on a reasoned argument

The Government's statement of December 7 shows clearly that the Government is adopting a pragmatic and experimental approach and that it is proposing to spend substantial resources on the expansion of higher technological education in Britain. Lord Cherwell could remark with some justice that, even in regard to the Imperial College of Science and Technology, progress is somewhat slow, but it is sound policy not to attempt to stereotype the relations between technological institutions and the universities The arrangements in Manchester for the expansion of the College of Technology, with an independent governing body dealing direct with the University Grants Committee, which has been made possible by the City's surrender of its former ownership and control, and building new technical colleges for technical instruction at the lower levels, are eminently sensible, but not for that reason necessarily a pattern for general application

What the Government could fairly be expected to do is to bring some sense of urgency to bear where negotiations and discussions are protracted, and to create, as in a technological grants committee, a body competent to formulate broad policy in terms of the national needs and supply just that amount of balance required to ensure the adjustment of local differences in terms of the national and not sectional interest The argument for some such body is indeed strengthened by the failure of the Lord President to show himself aware of the way in which local views and prejudices hinder the higher work of the colleges of technology , or the vital importance of an autonomous governing body, to enable expenditure on technological courses or research or the admission of students on a regional basis to be independent of local rates and similar exigencies

Such considerations cannot be ignored in formulating long-term plans for the expansion of technological education in Britain, or in considering the efficient administration of the large sums of money which Lord Salisbury indicated the Government proposes to make available for the purpose Nor did anything that was said in this debate remove doubts which exist as to whether the Government has a considered and co-ordinated policy for the expansion of technological and technical education These doubts have indeed been increased since the debate. Not even Sir David Eccles's energy, or the cogency, soundness and clarity of his views on education generally, can remove the misgivings which divided responsibility for technical and for technological education tends to cause If the Government does not see fit to implement this proposal for a technological grants committee, it should at least make clear the means it proposes to adopt to remove the shortcomings in technical colleges disclosed by the Select Committee on Estimates for the Session

1952–53, and to prevent their recurrence, to overcome the well-known obstacles to the more efficient working of such colleges and colleges of technology at the higher levels, and to keep the expansion of facilities for training technologists and technicians in balance and in harmony with the country's needs Such questions cannot be dismissed summarily as they were by Lord Salisbury, and the Parliamentary and Scientific Committee would do well to inquire further into these and other points on which the debate threw insufficient light.

LITERATURE AND SCIENCE

Literature and Science

By B Ifor Evans. Pp 114 (London George Allen and Unwin, Ltd, 1954) 8*s*. 6*d* net

A BOOK on the relationship between literature and science should receive a warm welcome from both scientists and men of letters Often the scientist has no interest in poetry, which he neither understands nor appreciates, while the artist, being largely unaware of the nature and objects of science, may feel resentful of the way in which science seems to have come to dominate men's lives. Nevertheless, the full development of the intellectual life of our times depends on the work of both artists and scientists. Both should contribute to the philosophy which guides our thoughts and actions. On both sides there should be more realization of the aims and methods by which each works, the little book by Dr. Ifor Evans gives us some insight into the mind of the poet and artist.

The influence of scientific studies on men of letters is no new problem. The author reviews the way in which poets have reacted from the Renaissance onwards But in reading this historical survey, which occupies the greater part of the volume, considerable doubts must arise as to whether the past climates of thought on scientific matters have always been accurately depicted by the author. It may be easy for us to imagine which investigations should have impressed thoughtful Englishmen in the seventeenth and eighteenth centuries, because we know those which have stood the test of time. But it does not follow that the more lasting discoveries and theories had the greatest effect on contemporary opinion Thus in writing of the early years of the Royal Society, the author refers to the intermingling of myth and magic and superstition with scientific proceedings But the Fellows of the Society at that time had still to discover that some of the topics they discussed originated only in myth or mythology, for example, the idea that minerals grew in the earth from seeds was regarded as requiring serious investigation

Again, in an interesting chapter on Wordsworth, Dr Evans deals only with the poet's references to Newton and to mathematics But from about the time of the poet's birth until he was fifty, British scientists seem to have been mainly interested in biology and geology. Sir Joseph Banks was president of the Royal Society for more than forty years, and the physical sciences languished. This, too, was the period when many beautifully illustrated books on flowers and birds were produced and had a wide circulation The discussion of geological problems led to the founding of the Geological Society in 1807. It is not improbable that Wordsworth's first visit to the Alps was inspired by de Saussure's "Voyages dans les Alpes". The second part of this beautifully illustrated work by the pioneer of alpine exploration, geology and natural history, appeared some four years before the young enthusiasts set out to walk to Switzerland.

The author shows how, in the nineteenth century, scientists and men of letters drifted apart. He considers that "the main development within the twentieth century has been the increasing uneasiness of the writer, the sense that he exists in a hostile society, and that the powers of science are increasingly creating a civilization in which he has little place" It is, however, not easy to maintain the view that the pursuit of science destroys an appreciation of the arts Many distinguished scientists are accomplished musicians, painters or novelists The author recognizes the merit of Sir Charles Sherrington as a poet But those who devote all their energies to some subject, whether it be science, literature, history or golf, may well neglect other pursuits. It should be recognized that Charles Darwin, a sick man seldom able to leave his house and garden, was a special case Perhaps one reason why poets feel neglected to-day is that so much of what they write is not readily comprehensible to the ordinary reader, it is not of the kind which one reads and re-reads in leisure moments

In spite of the criticisms that have been made, this is an interesting book and contains much food for thought When one reflects on the mystery and complexity of the universe as revealed by modern science, and on the disappearance of the cocksure attitude adopted by so many of the nineteenth-century scientists, one would think that a *rapprochement* between scientists and poets should be possible We scientists should take note of the author's desire for "a wider act of interpretation, both of the nature of the scientific imagination and of the discoveries and possibilities of modern research"

H. HAMSHAW THOMAS

GEOMORPHOLOGY FROM AN AMERICAN POINT OF VIEW

Principles of Geomorphology

By William D. Thornbury Pp. ix+618 (New York John Wiley and Sons, Inc., London Chapman and Hall, Ltd, 1954) 64*s*. net.

GEOMORPHOLOGY as a science has grown up in the railway age A hint of what was coming might be espied in those eighteenth-century travellers who, like Gilpin, began very haltingly to display an interest in the form of landscape rather than its formalized versions. A hundred years later and the trains have reached Lucerne, soon we are well into the age of physiography, that pleasant ill-defined compost which made an agreeable part of the later Victorian education A further hundred years, and this lively branch of science has given birth to a remarkable variety of new and odd words such as pediplains, steptoes and fluviraption. Speed of communication, moreover, allows the students at a certain Scandinavian university to be flown out after the lecture to look at the land-forms from the air

Progress has been rapid, yet the discussion of the characteristics, origin and development of land-forms will long continue to provide an attractive and challenging mental discipline and a valuable education. Geomorphology not only gives scope for the exploratory and cartographical type of mind but also allows abundant opportunity to increase with time the precision of measurement, examination and analysis. Probing, indeed, may gradually replace mapping in this as in other fields.

The question remains, what initial training is most likely to lead to further advances. In America where, with the advantage of good visibility, the geologist must have an immediate eye for country and must often do his own mapping, it is understandably associated with departments of geology. In Great Britain, where the mapping has been done and the reward for geologists often lies deeper down, interest in surface-forms has been taken up by a number of geographers. The present reviewer is inclined to stand outside any such arguments. It is obvious that the geomorphologist in common with all who approach geophysical studies must have command of more than one auxiliary science; and as yet it matters little from which particular lecture-room he sets out, provided that he is endowed with the necessary capacity for vision. The earth's surface-form is an entrancing object of study approachable by many, and surely geographers should be allowed to study the changing environment if they wish and to leave man out of their inquiries.

Geomorphology owes much to the stimulus of the newer lands; and Dr. W. D. Thornbury has provided an admirable text-book. It is sound, solid, efficient, unpretentious, well illustrated; a workmanlike job forming an agreeable epitome of the splendid American achievement in this field. His training, outlook and location lead him to define the subject as primarily geology, and many will agree with his hope (p. 14) "that a knowledge of mathematics, physics and chemistry never becomes more essential to an understanding of geomorphic discussion than a sound appreciation of lithology, geologic structure, stratigraphy, diastrophic history, and climatic influence". His initial chapter on the historical background is a model of condensation; a steady succession of chapters is then laid down to cover processes, cycles, the peneplain concept, coastal evolution, vulcanism. To a non-specialist, the balanced summary of Davis *v.* Penck is particularly acceptable. The author allows geomorphology to extend to a discussion of the form of the ocean bed; but tectonics are neatly avoided. There is an admirable chapter on the tools of the geomorphologist such as contoured maps, aerial photographs, soil maps; and a final chapter on some applications which may encourage those who ask what money there is in it. For American students there is indeed little lacking. Some reference might perhaps have been made to recent Canadian arctic work, for example, by J. L. Jenness and J. B. Bird. Among minor points, while the references at the end of most of the chapters are adequately up to date, some later European work on glaciers might have been added. The author omits to define the snowline, which would assist the understanding of p. 357; the reader is given no obvious opportunity to follow up the brief mention of strandflats (p. 436), and on p. 259, obviously the east face of the Vosges is meant. The American usage of the word topography will be noted.

Illustrations and diagrams are plentiful and references abound, including quite a number to British and European work, though chiefly where it is likely to prove of interest to those engaged in the interpretation of North America. Students elsewhere will need to be well supplied with maps to make full use of the book. The author's reading does not appear to have spread far enough into British journals to mention the work of J. F. N. Green, O. T. Jones or D. L. Linton, although he is thoroughly acquainted with Wooldridge and Morgan (1937), and from beside the Indiana limestone a short comment is appropriately given to M. M. Sweeting (1950) on caves. Remembering W. M. Davis's early work, it is refreshing and may provoke thought for some English readers to find the Weald meagrely summarized in fourteen lines, no comments on the Thames and no mention of the Lake District. Landforms on the American continent, after all, provide much to think about; and to Dr. Thornbury, England's chief interest appears to lie in its coasts, to which he gives a generous allowance of illustrations and citations. Nevertheless, this book makes a deserving, crisp and stimulating text covering a wide field within the established canon. Geomorphology is a lively subject and Dr. Thornbury maintains a wholly admirable balance in his comments on matters of current controversy. His succinct summary of the theories of Appalachian drainage, of submarine canyons and of pediments may be selected as likely to prove very welcome to students. Production and printing are excellent; and while the appeal is primarily to American readers, and to British students the price is high, this book can be thoroughly recommended.

GORDON MANLEY

SYNTHETIC POLYMERS

Fibres from Synthetic Polymers

Edited by Dr. Rowland Hill. (Elsevier's Polymer Series on the Chemistry, Physics and Technology of High Polymeric and Allied Substances.) Pp. xv + 554. (Amsterdam and New York: Elsevier Publishing Company, Inc.; London: Cleaver-Hume Press, Ltd., 1953.) 80*s*.

THE editor and his panel of authors are to be congratulated on the general standard of this book. The rapid growth of knowledge on the subject of macromolecules owes much to the fundamental research of the chemist and physicist working on the synthesis and structure of long-chain molecules polymerized from one or more forms of monomer unit. Apart from reference to a few classical syntheses, for example polypeptides, few of the references are pre-war, and it is interesting to see this contemporary work built into a massive science. Further, this contribution may well be used as a sound lead to workers in the more complex fields of biosynthesis of the natural polymers.

If the work suffers from one major fault, it is that there appears to be some overlapping of subject-matter; but this may be inevitable as each author has to produce a coherent story. It can be seen that in particular p. 126 anticipates Chapter 14. On the other hand, chapters describing techniques frequently involve descriptions of chemical and physical properties of polymers which have been dealt with in the appropriate sections on their polymerization or properties. A reduction of this duplication might have been achieved by adequate cross-referencing. The value of the book as a work of reference is unimpaired; but the tenacity of the reader who has to follow 550 pages is greatly extended by the wide and ambitious scope of the work This is particularly noticeable as the involved treatment of the assessment of textile properties forms the last chapters of the book. It would be extremely difficult, if not impossible, to write these sections in the clear and concise manner of the earlier chapters, and I think that the parts of the book dealing with textile properties as such might better have formed the subject of another publication This criticism in no way detracts from the value of the chapters from the point of view of reference, and the treatment of the dyeing of synthetic polymers is to be recommended as an excellent fundamental introduction to the subject.

There are certain minor criticisms, but attention should be directed here to the equation on p 382 It might have been more satisfactory to relate the denier of the spun yarn to the rate of take-up T at the final godet in metres/min, the pump throw D in c c /min, and n the number of filaments in the jet (x and r are as defined in the book), that is

$$\text{filament denier} = \frac{9\ \ 10^3\ \ D x}{n T}\ \ \frac{(100 + r)}{100}$$

This equation would then be more readily correlated with the statement on p 369, l 8

The chapters on crystallinity, etc, are excellent and give a clear picture of our present knowledge on the structure of these polymers Personally, I would prefer to see the X-ray diagrams reproduced as black reflexions on a white ground The fundamental chemistry of polymer synthesis is well covered, but in the chapter on the theory of polymer solutions the derivation of the usual fundamental thermodynamic equations might have been shortened

In conclusion, however, the editor and his collaborators are to be complimented on their achievement, and if one finds the work exhaustive, it is an excellent source of information for the student, and may well become a standard reference for all workers in the field of synthetic polymers F Happey

KERNEL FUNCTIONS

Kernel Functions and Elliptic Differential Equations in Mathematical Physics

By Stefan Bergman and M Schiffer (Pure and Applied Mathematics Series, Vol. 4) Pp. xiii+432. (New York Academic Press, Inc, 1953) 8 dollars.

THE methods initiated about a hundred years ago in the theory of electrostatic potential by the miller-mathematician, George Green, have now considerably developed. The determination of the solution of Laplace's equation which takes prescribed values on the boundary of a domain depends on finding the Green's function for that domain Other boundary value problems depend on the functions of Neumann and Robin These three functions all have singularities, but by taking the difference of two of them we can get rid of the singularity and form what is called a regular kernel function. The whole theory of the elliptic partial differential equations of mathematical physics can be based on the properties of these functions, which have been the subject of much recent research by the authors and others.

This book consists of two parts the first mathematical physics, the second pure mathematics. The first part contains four chapters, dealing respectively with the conduction of heat, fluid dynamics, electro- and magneto-statics, and elasticity In these chapters the fundamental solutions of the differential equations are introduced in a way which points out their physical significance The second part of the book contains an exact mathematical discussion of the kernel functions satisfying a partial differential equation rather more general than Laplace's equation. In addition to existence theorems, there are identities and developments in series which can be used for numerical computation Variational formulæ are obtained which throw light on problems of stability

The book requires considerable preliminary knowledge, including the theory of integral equations, but it will be very useful to advanced students who desire a guide to recent research on kernel functions, with an indication of opportunities for further advances There is an elaborate index and a very full bibliography of books and research papers

H T H Piaggio

CHEMICAL ENGINEERING

Chemical Engineering

By Dr. J. M. Coulson and Dr J F Richardson Vol 1 Fluid Flow, Heat Transfer and Mass Transfer. Pp. viii+370+16 plates (London Pergamon Press, Ltd., New York McGraw-Hill Book Company, Inc., 1954) 38s 6d net.

IT has been a matter of regret that few text-books dealing with chemical engineering subjects have been published in Great Britain, but recently there have been available from British sources two good text-books in elementary chemical engineering The present book is much more comprehensive, and Vol 1 now published is divided into four sections fluid flow, heat transfer, mass transfer and humidification and water cooling. The second volume will deal with the physical principles of chemical process design, such as distillation, drying and evaporation, liquid–liquid extraction, and adsorption and mixing and separation.

Each section of the book includes a theoretical treatment leading to the discussion of the practical applications and to worked examples. The diagrams and illustrations of various forms of chemical engineering apparatus have been very skilfully selected. Each chapter or each section includes a list of modern references and of symbols Mathematical treatment is given fully in order that it can be applied to a variety of problems the more difficult theoretical sections have been put into small print.

A fairly complete discussion is given of the boundary layer in the section on momentum, heat and mass transfer, but this relates primarily to flat surfaces and flow in tubes, whereas flow patterns around curved surfaces such as cylinders or spheres are not discussed. There is a brief discussion of flow convection across cylinders in an earlier section on heat transfer, but no reference is made to pipe stills Flow patterns around spheres are of some importance in connexion with the diffusional problems to be discussed in the next volume and might well have been included in the chapter on the boundary layer

The book is based on a course of lectures given over a period of years and can be strongly recommended The price is reasonable and the book is well produced and has a good index.

RECENT INFRA-RED AND X-RAY STUDIES OF COAL

By J. K. BROWN
British Coal Utilization Research Association, Leatherhead
AND
P. B. HIRSCH
Crystallographic Laboratory, Cavendish Laboratory, University of Cambridge

Introduction

THE purpose of this article is to describe the results of recent infra-red and X-ray measurements on coals, to summarize briefly the joint conclusions, and to compare them with those of other investigators More detailed accounts of the infra-red and X-ray work are being published elsewhere[1]

Coals form a series ranging from peats, through the lignites to bituminous coals and anthracites (for details concerning the classification of coals, see ref. 2). Geological evidence suggests that this series represents a continuous and progressive change, the metamorphic process is termed 'coalification'. The three main chemical elements which occur in coals are carbon, hydrogen and oxygen. As the degree of coalification increases, there is an increase in the percentage of carbon and a decrease in the percentages of hydrogen and oxygen Microscopic examination of coals shows that they consist of a number of different components of which the most homogeneous is vitrain, it is a major constituent of the bright coals. A range of vitrains with carbon contents between 78 and 94 per cent (by weight, dry basis, free from mineral matter) has been studied in the present work.

Chemical Structure

The major chemical constituent of all coals is carbon Both chemical and infra-red spectroscopic measurements agree in showing that a large proportion of this carbon occurs in aromatic systems, and there is strong evidence that at least some of this is in the form of condensed rings[3]. The sizes of the condensed aromatic ring clusters in a coal of approximately 85 per cent carbon content have been estimated previously both by chemical[4] and X-ray methods[5]. Chemical investigations of the hydrogenation products[4] indicate that systems containing between two and six condensed aromatic rings predominate, whereas X-ray diffraction line-widths have been interpreted in terms of 'graphitic' layers of approximately 20 A. diameter, this corresponds to some fifty condensed rings

The present X-ray work has been carried out in more detail than was previously attempted The results show that approximately 75 per cent of the carbon is in the form of condensed aromatic units, and that for a coal of 85 per cent carbon content these contain about four or five rings This result, which agrees with the conclusions from chemical studies, applies to the *whole* of the coal The remainder of the carbon and the other atoms are effectively disordered

Although it has not been possible to deduce from the infra-red spectrum that ring clusters of the above size exist in the structure, the results are consistent with this estimate The value of the infra-red method is that it can give information, which cannot be obtained from the X-ray scattering, concerning the nature of the disordered material Thus the X-ray and infra-red methods are complementary. The disordered material is assumed to be in the form of chemical groupings which are attached to the condensed aromatic rings For example, the analysis of the spectrum of a coal of 85 per cent carbon content shows that aromatic material is present together with saturated aliphatic (and possibly alicyclic) groupings. The weakness of the absorption bands which arise from aromatic C—H bonds compared with those arising from ring vibrations suggests strongly that the aromatic rings are highly substituted The ratio of aliphatic to aromatic C—H bonds has been estimated to be approximately 4 1 for this coal

The infra-red spectrum shows that oxygen is present in hydrogen-bonded phenolic hydroxyl groups Oxygen in aromatic ether or polycyclic quinone structures is believed to cause the observed considerable enhancement of the intensity of the aromatic ring vibration absorption band near 1,600 cm.$^{-1}$ More will be said about these forms of oxygen in connexion with the changes in the spectra with carbon content Cannon[6] has made an assignment of the main absorption bands in coal spectra and has reached some of the conclusions discussed here The chief difference is that he has reported the occurrence of aldehyde or keto groups and ester groupings in the structure These have not been detected in any of the coals studied in the present work, we suggest that the discrepancy may be due to the fact that Cannon's samples were not pure vitrains.

Changes in Chemical Structure with Carbon Content

X-ray methods have been used for measuring the sizes of the condensed aromatic ring clusters for the complete range of coals. The results are shown in Fig. 1, where the diameters and the numbers of rings in the layers are plotted against the carbon content Below about 89 per cent carbon the variation in the number of rings in each unit is small, but at carbon contents higher than this value the size of the ring clusters increases rapidly. The type of variation shown in Fig 1 has previously been reported by Blayden *et al* [5], but, as stated earlier, the number of rings in each condensed unit found by these workers was very much larger than that deduced from the present work. The possible error in measuring the proportion of ordered carbon (± 20 per cent) is too large to permit the determination of the variation of this quantity with carbon content Several workers[7-10] have used statistical methods based on ultimate analyses, helium densities, refractive indices and calorific values of coals in order to estimate the sizes of the condensed aromatic systems and the proportion of aromatic carbon. These methods give a variation of ring size with carbon content of the type found in the present X-ray work, although these estimates are in general somewhat high, the values obtained from refractive indices[8] and calorific values[10] are of the same order of magnitude as those found in the present work.

The infra-red spectra of the range of vitrains have been studied, in order to follow the changes in

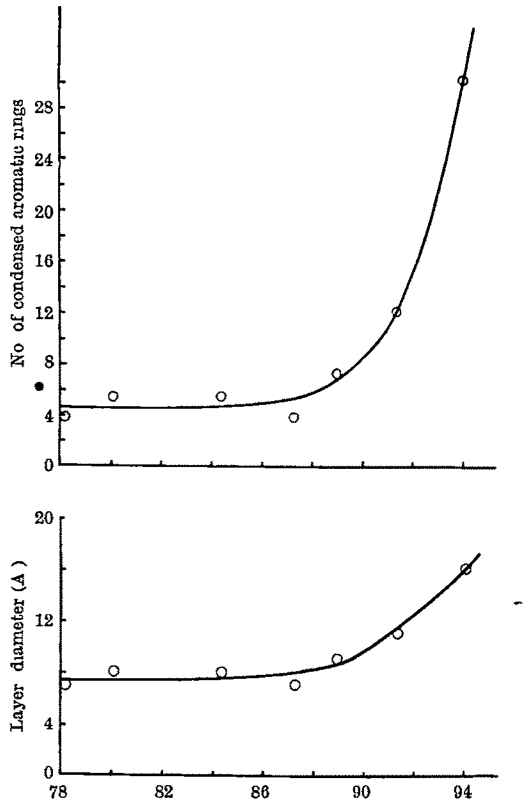

Fig 1 Layer diameter and number of condensed aromatic rings as a function of carbon content

intensity of absorption bands assigned to substituent groups and to examine the variation in aromatic substitution which accompanies these changes

The absorption bands which arise from hydrogen-bonded OH groups are very strong in vitrains of 78 per cent carbon content. With increasing carbon content the intensity of these absorption bands decreases until at 89 per cent carbon they are very weak In these latter coals the concentration of hydroxylic material must be small. The intensity of the 1,600 cm.$^{-1}$ absorption band which, as stated earlier, is believed to arise from the presence of aromatic ethers and/or polycyclic quinones, undergoes remarkably little change with carbon content, this suggests that these structures occur throughout the range of coals, except possibly in the anthracites (94 per cent carbon), where it was impossible to estimate the intensity of the absorption band In view of these observations, it is suggested that the decrease in oxygen to carbon ratio between 78 and 93 per cent carbon is due mainly to the loss of OH groups.

The ratios of the optical densities of absorption bands arising from aromatic and aliphatic C—H vibrations, D_{ar}/D_{al}, have been measured for vitrains with carbon contents between 84 and 93 per cent The results are shown in Fig 2 An approximate ratio of the extinction coefficients for these absorption bands has been obtained from the study of a number of alkyl substituted and hydro-aromatic condensed compounds From this value the relative numbers of aromatic and aliphatic C—H bonds have been calculated for the coals This estimate gives directly the ratio of the aromatic to aliphatic hydrogen, and from these results it is a simple matter to calculate the ratio of aromatic hydrogen and aliphatic (or alicyclic) hydrogen to carbon from the known total hydrogen to carbon ratios (These ratios have been corrected for hydrogen in the form of OH groups on the assumption that all of the oxygen occurs in this form, the infra-red data suggest that this assumption is not strictly true, but the error involved is very small) Fig 3 shows that the aromatic hydrogen increases while the aliphatic hydrogen decreases with increasing carbon content The increasingly rapid rate of loss of aliphatic groups at carbon contents greater than 89 per cent must account for the very marked decrease in the ratio of total hydrogen to carbon observed in that range Although accurate measurement of D_{ar}/D_{al} at 94 per cent carbon was not possible, the spectra indicate that the amount of aliphatic material is very small for these coals Also, at 94 per cent carbon, the spectra suggest that there is a decrease in the aromatic hydrogen content

Assuming that the amount of aliphatic carbon is half that of the aliphatic hydrogen (that is, that CH_2 groups predominate) the fraction of aromatic carbon can be calculated. The results are shown in Fig 4 (Using a somewhat different approach, Dryden[11] has calculated upper and lower limits of the fraction of aromatic carbon, the present results fall within this range) The fraction of aromatic carbon increases from a value of approximately 0 72 at 84 per cent carbon to 0 92 at 93 per cent carbon. Van Krevelen and Chermin[12] have estimated the fraction of aromatic carbon on the assumption that the volatile matter arises from the aliphatic material; their results are also given in Fig 4 and are seen to be in good agreement with the present estimates The values estimated from the X-ray scattering (75 ± 20 per cent) are also of the same order of magnitude

The variation in aromatic substitution with carbon content has been studied by analysing the pattern of absorption bands between 700 and 900 cm^{-1} At the beginning of the range of carbon contents (78 per cent carbon), the degree of substitution is high, with increasing percentage of carbon content it decreases, in agreement with the observation that the amount of aromatic hydrogen increases Part of this decrease in substitution is most probably due to the loss of phenolic OH groups, and the remainder results from the removal of some aliphatic material. Between 89 and 93 per cent carbon, the degree of substitution

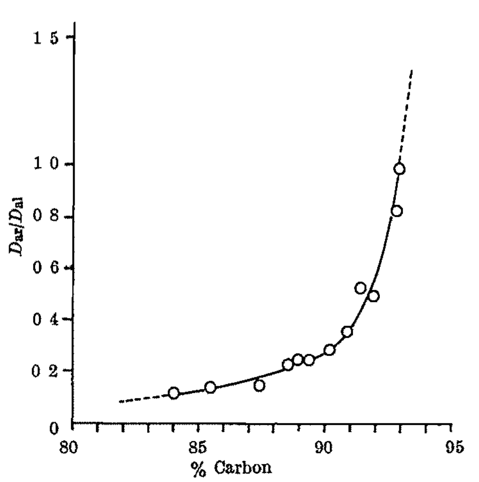

Fig 2 Ratio of optical densities of aromatic and aliphatic C—H stretching absorption bands as a function of carbon content From Brown, J K, "Infra-red Spectra of Coals", *J Chem Soc* (in the press)

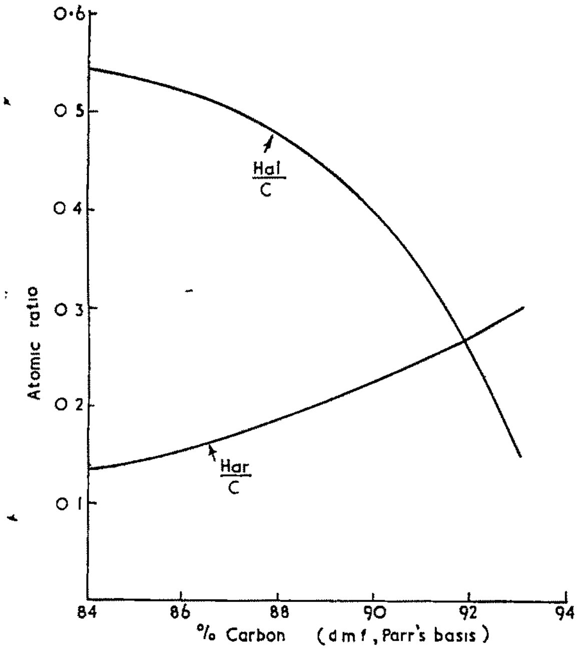

Fig. 3. Variation of the ratio of aliphatic, H_{al}, and aromatic hydrogen, H_{ar}, to total carbon, C, with carbon content

decreases, mainly due to the removal of aliphatic groups. At 94 per cent carbon the analysis shows that aromatic rings which contain isolated C—H bonds predominate in the structure. This result, when considered in conjunction with the fact that only a very small amount of aliphatic material is present, suggests strongly that large condensed aromatic systems occur; these would be expected to contain a high proportion of such rings on their periphery.

In addition to the changes which have been discussed above, the spectra also show a structureless background absorption. The intensity of this background absorption is low in the spectra of vitrains with carbon contents up to approximately 89 per cent, but then shows a marked increase and becomes very high at 94 per cent carbon. In agreement with a previous suggestion by Cannon[6], the effect was thought to arise from an electronic absorption band which moves from the visible across the infra-red region with increasing carbon content. It was believed to result from the growth in size of the condensed aromatic structures. Recent work by R. R. Gordon et al. (*Nature*, 174, 1098; 1954), however, strongly suggests that the structureless background 'absorption' arises from the scattering of radiation and is not of electronic origin.

Packing of the Condensed Aromatic Layers

Evidence for the packing of the aromatic layers in coal structure comes from a detailed analysis of the X-ray data. This concerns in particular the band at 3·5 A. (002 band), a peak at 20 A. and the diffuse scattering at lower angles. By analogy with the structure of amorphous carbon[13], the 002 band is considered to be a consequence of the packing of the aromatic layers parallel to each other in small groups. The layers, however, have no particular orientation relative to each other about an axis normal to their plane (turbostratic packing[13]) and they may be displaced parallel to each other. Fourier analysis of the 002 band shows that, in a vitrain of approximately 85 per cent carbon content, about 60 per cent of the layers occur singly, 28 per cent in groups of two, and the remainder in groups consisting of a larger number of units. With increasing carbon content the order improves; the proportion of single layers is reduced and the fraction in larger groups increased; but even at approximately 89 per cent carbon, about 45 per cent of the layers occur singly. By far the most frequently occurring *parallel group* in all the coals consists of two layers.

The layers have a preferred orientation parallel to the bedding plane; the preferred orientation is small but measurable even in the coals of smallest carbon content studied. The orientation improves with increase in the carbon content of the vitrain, the effect being particularly marked in coals with carbon contents greater than 89 per cent. The layer spacing is about 3·52 A. for the coals between 84 and 92 per cent carbon; in vitrains with smaller percentages of carbon, the spacing is considerably greater (~3·7 A.). At the upper end of the range (near 94 per cent carbon) the spacing is reduced to 3·43 A., that is, close to that observed for pure amorphous carbon.

At lower angles the intensity of the diffuse scattering decreases with increase in carbon content up to approximately 89 per cent carbon. Beyond this value it increases again. There is a close similarity between the behaviour of the diffuse scattering and the porosity of the vitrains[14], which suggests that it arises from pores. The shape and intensity of the low-angle scattering curves for coals with carbon contents of approximately 85 per cent suggest that there is a very wide distribution of pore diameters; this distribution extends from a few angstroms to values greater than 5000 A. Wide distributions of pore sizes have also been found from recent surface-adsorption measurements[15]. A measurement of the intensities and shapes of the low-angle scattering curves suggests that at least some of the pores have a disk shape and are oriented parallel to the bedding plane. The X-ray scattering is not consistent with the Bangham model[16] of close-packed micelles of approximately 200 A. diameter.

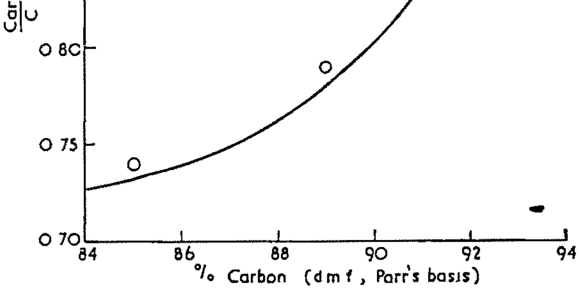

Fig. 4. Ratio of aromatic to total carbon for a range of vitrains. ——, from present work; O, Van Krevelen and Chermin (ref. 12)

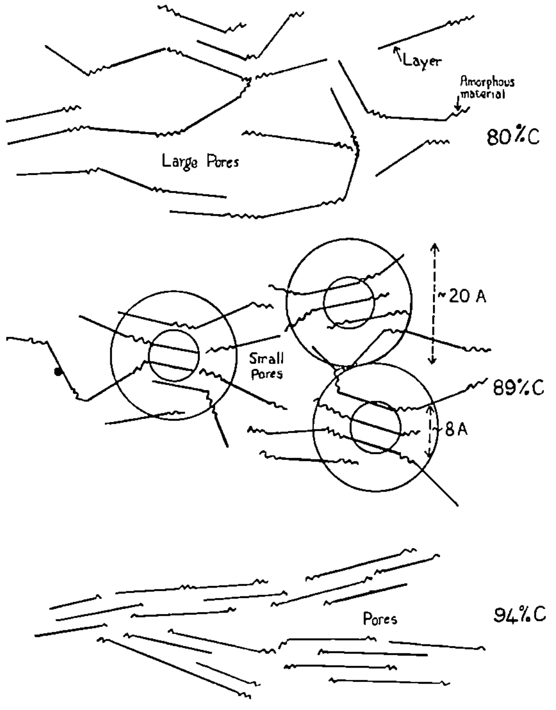

Fig 5 Schematic diagram of the packing of coal molecules at various stages during the process of coalification

For coals with carbon contents greater than about 84 per cent, a peak appears in the scattering curve which corresponds to a spacing of 20 A. This peak is most pronounced in vitrains with carbon contents near 89 per cent and then decreases again in intensity. An analysis of the Fourier transforms shows that the peak arises from units of overall diameter $\sim$ 20 A, the density of which varies continuously from the centre outwards, and which contain a central dense core of diameter $\sim$ 8 A, both parallel and perpendicular to the bedding plane This central core is considered to be a group of two completely overlapping graphitic layers, the dimensions of which are also of $\sim$ 8 A. The rest of the unit consists of layers which are either displaced parallel to each other or misorientated, and of the amorphous material which is considered to be in the form of substituted groups. Fig. 5 shows the type of packing envisaged. The distance from centre to centre of neighbouring layers is only $\sim$ 10 A , the fact that the layers surrounding the core cannot pack tightly suggests (but does not prove) that neighbouring layers are chemically linked by bonds which enforce a buckling of the structure Density considerations indicate also that, for vitrains with 89 per cent carbon, micropores of $\sim$ 10 A diameter occur in the structure The existence of such micropores has also been indicated from the results of recent gas and liquid absorption measurements[15,17].

At least some of the units appear to be close-packed at distances of $\sim$ 20 A , but the ordering is poor as in a liquid The 'liquid-like' structure is continuous over distances of the order of microns. Beyond 89 per cent carbon the 20 A peak becomes less pronounced and the diffuse scatter at low angles increases The Fourier transforms indicate that some of the units containing the 8 A core still persist, while the average diameter of the 'graphitic' layers at 94 per cent carbon determined from the scattering at high angles is now found to be $\sim$ 16 A. It is suggested that locally there remain regions in the coal where 8 A. diameter lamellæ occur in groups of diameter 20 A , but that in other parts of the structure several lamellæ have grown together to form larger graphitic layers This process is accompanied by a flattening of the structure , there is an improvement of the local parallel packing of the layers, which must have the consequence of enlarging the pores in neighbouring regions, giving rise to an increase in the intensity of diffuse low-angle scattering. Such a 'clustering' process will result in a wide distribution of layer diameters , this conclusion is in good agreement with the shapes of the bands at high angles. The clustering of the condensed aromatic structures in vitrains with carbon contents greater than 89 per cent takes place particularly rapidly between 92 and 94 per cent carbon

The arrangement of the aromatic layers in coals with different carbon contents is shown in Fig 5.

The Coalification Process

The infra-red and X-ray measurements will now be considered together to obtain a more complete description of the coalification process Between 78 and approximately 89 per cent carbon, the sizes of the condensed aromatic ring systems in coal structure increase only slightly , the units consist of four to five rings up to approximately 87 per cent carbon, increasing to about seven rings at 89 per cent carbon. This change is accompanied by a small increase in the aromatic carbon and hydrogen and a small decrease in the aliphatic hydrogen contents.

There is a gradual improvement in the molecular packing with increasing carbon content ; as a result of this, a 'liquid-like' structure is formed and all the large-scale pores disappear. An important chemical change which occurs in this range of coals involves a very marked reduction in the number of hydrogen-bonded OH groups in the system. At carbon contents near 89 per cent, the infra-red results indicate that the phenolic content must be small At this stage the 'liquid-like' packing is at its best and the porosity is a minimum It is reasonable to suggest that the large reduction in the number of hydrogen-bonded groups is connected with the improvement in packing of the condensed aromatic layers.

Between 89 and 94 per cent carbon, the aromatic layers grow rapidly in diameter and a wide distribution of layer sizes is observed. This is accompanied by a large increase in the proportion of aromatic carbon in the structure and a corresponding decrease in the aliphatic (or alicyclic) content. The aromatic hydrogen shows an increase up to 93 per cent carbon , at 94 per cent carbon some decrease is observed The 'liquid-like' structure present at 89 per cent carbon gradually disappears with increasing carbon content, and pores are produced

It is not possible to consider in detail the process by which the aromatic layers increase in size with carbon content However, it is clear from the quantitative estimates of the proportions of aliphatic and aromatic carbon that the aliphatic material associated with each cluster cannot alone produce the number of rings required to account for the increase. In order to produce this very marked increase, two or more neighbouring layers must coalesce to form larger perfect condensed sheets. It is likely that this is accompanied by an aromatization of at least some of the aliphatic or alicyclic groupings A consideration of the X-ray results for vitrains in the range 89–94 per cent carbon has already led to the conclusion that a local condensation of the layers takes place with increasing carbon content. It seems most probable that the much smaller increase in layer diameter observed between 87 and 89 per cent carbon also occurs in this way. The formation of the large condensed aromatic structures in the anthracites (94 per cent carbon) has been accompanied by the loss of some aromatic hydrogen, which presumably has been eliminated from the rings during the condensation process.

Although the changes during coalification have been to a large extent considered separately for the regions 78–89 per cent carbon and 89–94 per cent carbon, there is no reason for believing that there is any discontinuous transition between the two. The regions have been separated so that the major changes which occur could more readily be discussed.

Conclusion

The model which has been put forward in the preceding discussion is intended to act as a guide in the interpretation of future chemical and physical investigations of coal constitution. It is tempting to suggest detailed chemical structures which are based on the proportions of substituent groups deduced from the infra-red work However, it is felt that any such attempt would be premature—and possibly misleading—at the present stage A number of structures have been tried which are consistent with all the data, and from these it is clear that the aliphatic chains must be short, it is possible also to obtain consistency if alicyclic rings are present. However, there are many problems concerning the detailed configurations which remain to be solved One of the most important of these is to determine whether the condensed aromatic systems are linked by chemical bonds in a polymer-type structure, or whether they occur mainly as isolated units Consideration of the origin of the 20 A. band which occurs in the X-ray diffraction pattern from coals with carbon content between $\sim$ 86 and 94 per cent carbon suggests that some of the layers may be linked to form a structure extending over at least 20 A Both X-ray[18] and infra-red studies of solvent extracts[19] obtained at moderate temperatures show that they contain structures very closely related to the main part of the coal A polymeric system is expected to behave in this way, the extraction being mainly on a molecular-weight basis. It should be noted that the possibility of aromatic ethers existing in the structure of a wide range of vitrains does suggest that some linking of the units by oxygen may occur The infra-red evidence for such linkages in the solvent extracts is the same as that in the coals. Molecular weights of extracts in various solvents have been quoted by a number of workers[20], they range from approximately 250 to 4,000 The units consisting of approximately four condensed rings substituted by aliphatic and OH groups found in the present work would have molecular weights at the lower end of the above range The higher molecular weights may be due to cross-linked layers, or to physical aggregation

The low density of coals (c 1 3) when compared with that of graphite (c 2 2) is quite compatible with the suggested structure. It arises from the poor packing of the molecules which results in micropores The porosity observed experimentally is mainly the consequence of a wide distribution of larger pores, some of which are disk-like. But even in vitrains of approximately 89 per cent carbon, where the porosity is very small, there must exist micropores (c. 10 A diameter and less) in the 'liquid' structure.

The decrease in the strength of coals (as measured by Young's modulus[7,21], grindability index[22] and viscosity[7]) with carbon contents up to 89 per cent seems to follow, and may be a result of, the gradual disappearance of groupings which form strong intermolecular hydrogen bonds The greater strength of the anthracites is doubtless a result of the increasing forces between the larger flat condensed structures

The variation in the optical properties, for example, birefringence, refractive index and absorption coefficient[7,23], of the vitrains with carbon content can be accounted for, at least qualitatively, in terms of the model proposed But the reason for the dark colour of the coals is not yet clearly understood.

One of us (P. B. H.) wishes to thank Sir Lawrence Bragg and Dr. W. H. Taylor, in whose laboratory the X-ray work was carried out, for constant help and encouragement, he is also grateful to Sir Charles Ellis for initiating the X-ray work, to the National Coal Board for financial assistance, and to the managers of the I C I Fellowship Fund of the University of Cambridge for the award of a Fellowship.

The other (J. K. B) is grateful to Prof. F. J. W. Roughton and Dr N. Sheppard for the facilities afforded in the Department of Colloid Science, Cambridge, and to the members of the British Coal Utilization Research Association, Leatherhead, in particular to Dr I G. C Dryden, for constant advice and encouragement. He would also like to thank the Association for permission to publish this communication.

We thank Dr G W Fenton and Mr J W Fowler, of the Coal Survey Laboratory, Sheffield, and Dr. I. G. C. Dryden, of the British Coal Utilization Research Association, for providing specimens of pure vitrains

BRITISH-KENYA MIOCENE EXPEDITIONS

INTERIM REPORT

IN the summer of 1947, following the first Pan-African Congress on Prehistory, held in Nairobi, and the opportunity provided on that occasion for the examination of the important Lower Miocene fossil Primates already found in Kenya and for visits by members of the Congress to the sites where they were collected, the Royal Society made a grant of £1,500 to enable more intensive investigations to be carried out by geologists and palæontologists The results of these investigations were eminently successful, and adequate annual grants for their continuation were afterwards made available by the Kenya Government, supplemented by some private benefactions In particular, a motor launch was provided by the generosity of Mr C. W. Boise to facilitate visits to the fossiliferous islands in Lake Victoria It seems appropriate, now that seven years work has been completed, that a brief summary should be given of the results so far achieved

The total number of specimens from Lower Miocene deposits obtained during this period exceeds fifteen thousand The majority of these were recovered from sites on Rusinga Island and Mwafangano Island, and others have been found at sites of similar age on the mainland ranging from Karungu in the south to Muruorot (west of Lake Rudolph) in the north The specimens cover a very wide range of material, vertebrate and invertebrate, as well as the fossilized remains of the contemporary vegetation So far as the mammalian material is concerned, in some respects the most interesting are the fossil Primates. These include the nearly complete skull of *Proconsul africanus* (the only specimen of the skull of a Miocene ape so far known), an abundant collection of jaws and teeth of this genus as well as some of the limb bones (including a complete hand skeleton), jaws and teeth and limb bones of a primitive gibbon-like ape *Limnopithecus*, and also remains of cercopithecoid monkeys and lemuroids. Other mammalian fossils include representatives of many different orders, ranging from small insectivores and rodents to anthracotheres and proboscidians The vertebrate collections also include many specimens of reptiles and fishes The Early Miocene invertebrate fauna is represented by a wide range of Mollusca, numerous Myriapoda, a few Crustacea, and a remarkably well-preserved collection of fossil insects and allied groups Finally, the material includes a large series of fossil fruits and seeds representative of an extensive flora

The study of these collections of Lower Miocene material is being undertaken by a number of specialists, and already several reports have been published in a series of monographs issued by the British Museum (Natural History) under the general title "Fossil Mammals of Africa". So far, the published reports have dealt with the Hominoidea, Lemuroidea, Anthracotheroidea, Lagomorpha and Hyracoidea Other monographs in the press are concerned with the Insectivora, Tubulidentata, Ruminantia, and with an almost complete skull of a Miocene lorisiform Lastly, reports are in course of preparation on the Rhinocerotidae, Suidae, Cercopithecidae, Carnivora and Rodentia, as well as on the fossil reptiles, Myriapoda and the flora

The geological work of the British-Kenya Miocene Expeditions has involved detailed field-mapping by Prof R Shackleton, Dr T Whitworth and Mr I. Higginbottom, and the results of these studies (which have appeared as a series of papers in the *Quarterly Journal of the Geological Society*) demonstrate the relationship of the Miocene beds to other formations as well as the complex stratigraphy of the fossiliferous deposits themselves

In addition to the main excavations, reconnaissance visits have been made to two regions containing Miocene deposits in the Northern Province of Kenya, and to a supposed Lower Miocene area near Maralal (which, however, is more probably of Pliocene age) Small collections were made at these sites, but none of them proved to be rich in fossils Excavations carried out on Maboko Island have established that the deposits at this site are only partly of Lower Miocene age , other beds there are evidently of later date, though they contain some true Miocene fauna as derived fossils Lastly, an extensive survey, made possible by the motor-launch, has been carried out on numerous islands in Lake Victoria in order to determine the western extension of the Lower Miocene deposits The latter do not appear to extend beyond Mageta Island (but here they are unfossiliferous)

The following have taken part in the field-work of the British-Kenya Miocene Expeditions during the past seven years Dr and Mrs L S. B Leakey, Dr D G MacInnes, Prof R Shackleton, Dr T Whitworth, Mrs Coryndon, Mr I Higginbottom, and also a trained group of African field-workers Among visiting scientists who have examined parts of the area are (the late) Miss D M Bate, Prof D M. S Watson, Dr K. P Oakley and Prof G H R von Koenigswald.

The work of the expeditions is being continued as circumstances permit But it is already possible to say that the Kenya Lower Miocene deposits provide one of the most complete records of the fauna and flora of the period, and for the first time present a full picture of the terrestrial and freshwater life of the Lower Miocene in the African continent

THE PHOTOGRAPHIC PROCESS

THE appearance of a second edition of C E K. Mees's "The Theory of the Photographic Process"* provides an occasion for a review of the present state of our knowledge of this subject, and especially of the nature of the photographic latent image and its formation by exposure to light But in doing so, the reviewer does not wish to imply that the discussion of a theory in any such narrow sense forms the main or necessarily the most important part of this massive volume of more than a thousand pages Written by the vice-president in charge of research in the Eastman Kodak Company in collaboration with more than twenty of his colleagues, it must be taken to represent the considered view of the Company on all scientific aspects of photographic materials and of the action of light on them. There are particularly valuable sections on optical sensitizing, development and sensitometry, and there are new chapters dealing with the action of charged particles and of X-rays on photographic emulsions. The whole book contains a very large amount of experimental material which is both of practical value and relevant to any discussion of the principles involved in the process.

---

* The Theory of the Photographic Process By Dr C E Kenneth Mees, F R S Revised edition Pp x+1133 (New York The Macmillan Company, 1954) 21 50 dollars

But any attempt to understand what happens in photographic emulsions is faced by the difficulty that emulsions differ so much from one another. One is therefore tempted to make use of experiments on large crystals of silver bromide and similar materials, such as those carried out in Gottingen between the two World Wars by R. W. Pohl's school and more recently by J. W. Mitchell and his colleagues at Bristol, the latter experiments making use of sensitized as well as pure crystals and being specially designed to throw light on the photographic process.

In 1938 the late R. W. Gurney and the reviewer published a theory of the photographic process which was based on three results of the Gottingen school. These are, that silver bromide crystals show photoconductivity, that the range of the photo-electrons is decreased when colloidal metal is present, and that silver bromide shows ionic conductivity at room temperature or above. It was therefore proposed that the primary action of the light was to produce photo-electrons, that these electrons were trapped by any metal particles already formed or by 'sensitivity specks', believed to be silver sulphide, and that the negative charge was then neutralized by the movement of silver ions. In this way, starting from a nucleus of silver or of sulphide of perhaps only molecular dimensions, a speck would grow which would first serve as a latent image and finally become visible under the microscope. The 'positive hole' left behind by the electron was supposed to move about by electron transference until it reached the surface of the grain, when a bromine atom would escape, normally at a point quite distant from that where the silver was formed. This theory stimulated a good deal of experimental research, particularly in the Kodak Research Laboratories at Wealdstone and at Rochester. These researches supported the theory, especially the basic assumption that two processes are involved, one electronic and one ionic. The two processes could be separated in time if the initial exposure was made at a low temperature and the emulsion afterwards warmed up.

At the present time it seems that this theory may be correct for the print-out process and perhaps for some emulsions, too. But there is now evidence that the formation of a latent image need not necessarily be accompanied by the separation of any positive and negative charge. Miller and Hamm[1] appear to have established that the photocurrents observed in photographic emulsions by West and Carroll rise slowly over a period of seconds and may continue to rise after the cessation of illumination. This is not the characteristic inertialess behaviour of the photocurrents observed by Glaser and Lehfeldt of the Gottingen school in large single crystals of silver halides. Even here, however, J. W. Mitchell's group has demonstrated the absence of inertialess photoconductivity at low temperatures in some single crystals of pure silver bromide, provided that these crystals had not previously been illuminated at room temperature so as to cause the separation of silver. These results and others suggest that the latent image may be formed by a mechanism in which silver and bromine are produced very close to each other and later diffuse apart. What seems to happen is that, on illumination, an 'exciton' or state of excitation is produced either in the halide or in a sensitizing dye layer, that this exciton can move a considerable distance, and that it eventually gives up its energy at a 'kink site' on the crystal surface or on a dislocation, where a silver atom and a bromine atom are formed. The bromine then escapes into the gelatine or is taken up by a halogen acceptor; the silver atoms form pairs or bigger groups which constitute the latent image.

To make this clear, we must discuss the meaning of the two terms used. An exciton in an adsorbed dye layer is simply an excited molecule and can move through the layer by transferring its energy to any one of its neighbours. In silver bromide we cannot speak of molecules; it is permissible to think of excitons as positive holes bound in the field of electrons. But the result is the same; we have a state of excitation which can move through the lattice.

Certain aspects of the properties of dye-sensitized emulsions provide perhaps the first evidence that a latent image can be formed without photoconduction; as the discussion in Mees's book shows, it is difficult to see how the excitation of a dye molecule can produce a free electron, and the experiments on the photoconductivity of emulsions to which reference has already been made do not appear to have established the existence of inertialess electron currents of the type which would be expected. Moreover, these experiments strongly suggest that pure silver bromide is not a photoconductor at low temperatures, as previously appeared to be the case. The normal process in this substance and other ionic crystals and oxides seems to be as follows. The light is absorbed by the crystal and forms an exciton. If this, during its life-time of not more than 10^{-8} sec., does not 'collide' with an impurity centre, the energy is re-radiated, as light or heat. If, however, it comes in contact with an impurity centre where a loosely bound electron is attached, it can give up its energy so that the electron is released and can take part in a photocurrent. That this occurs is shown particularly clearly by Apker's[2] experiments on alkali halides carried out in the laboratories of the General Electric Company at Schenectady.

We are therefore led to believe that the formation of latent image silver is normally due to the direct action of an exciton on an ion-pair of silver and bromine. Clearly such an ion-pair must be at a 'kink site' if it is to react; by a kink site is meant a site at the end of a row of ions. Such a site may occur on a surface or at a point on a dislocation; in the latter case it is usually called a 'jog'. The energy of the exciton is sufficient to transfer an electron from the bromide to the silver ion; following J. W. Mitchell, we then assume that the bromine atom moves close to the neighbouring surface, so that the electron cannot move back. This is the primary electronic part of the process; eventually the silver atom and bromine separate by diffusion, the silver to join with other atoms of silver to form the latent image, a speck of metal, and the bromine to form molecules which escape. This may well be the mechanism for the formation both of the surface latent image and the internal image, which the work of Hedges and Mitchell[3] shows to be located along dislocations.

For a sensitive emulsion, then, we require two things: an acceptor for the halogen, a role probably taken by the sulphide sensitizer, and some 'rough' regions on the surface, where there are many kink sites close together, so that silver atoms released by the process described above can easily combine. These rough regions are the sensitive parts of the crystal; the work of Mitchell's group shows them to occur, as one would expect, where a substructure or array of dislocations meets the surface. This, at any rate, is what happens in large crystals, and probably in grains of emulsions, too.

A model of this kind seems to fit many of the facts and probably comes nearer to the true mechanism for many actual emulsions than the original Gurney–Mott theory. It is remarkable how an understanding of the photographic process seems to involve all the latest concepts of the theory of solids, from the movement of excitons to diffusion of atoms along dislocations.

OBITUARIES

Prof. A. R. Richardson, D.S.O., F.R.S.

LIEUT.-COLONEL ARCHIBALD READ RICHARDSON, Fellow of University College, London, and the first holder of the chair of mathematics in the University College of Swansea, died recently at his home in Cape Town at the age of seventy-three. He was educated at the Royal College of Science and University College, London, where he afterwards joined the staff, and in 1912 he was appointed assistant professor of mathematics in the Imperial College of Science and Technology. He had fought as a volunteer in the South African War and was a prominent member of the Officers' Training Corps in the University of London. During the First World War he had a distinguished military career when he commanded the 2/2 and later the combined 2/1 and 2/2 battalions of the London Regiment, but he received serious wounds in the German offensive of March 1918 which permanently affected his health. Shortly before his appointment to Swansea in 1920, Colonel Richardson held the chair of aeronautical science at the Cadet College, Cranwell.

Richardson's early work showed his versatility as a mathematician, for he came to Swansea with a reputation in hydromechanics and an interest in real variable analysis. His first few years at Swansea were occupied by studies on the moment problem, but he soon turned his attention wholly to the rich, and at that time largely unexplored, field of modern algebra, becoming a pioneer and leader in a branch of mathematics then almost entirely neglected in Britain. The twenty-two papers published since his appointment to the Swansea chair represent a contribution to mathematics out of all proportion to their number. It is the extensive range of subject-matter covered and the originality and novelty of the individual papers that are so striking. The earlier papers dealt with hypercomplex determinants and with concomitants and equations over a division algebra. The theory of group characters and representations owes much to the work he did in the early nineteen-thirties, and his discovery of immanants formed a nucleus around which a host of new results accumulated. He was a pioneer rather than a consolidator, and his attention later turned to the new fields of abstract algebra, groupoids and the composition of cubic and quadratic forms. He retired to Cape Town in 1940 for reasons of health, but continued to prosecute research until shortly before his death on November 4, 1954. He was elected a Fellow of the Royal Society in 1946.

Until he received his war wounds, Richardson had given the same untiring energy to sport and military training that he showed in teaching and research. Few men could have survived the severe wounds and consequent operations which he suffered; and when he found himself restricted to a life of semi-invalidism, his true quality was displayed in the singleness of purpose with which he turned his immense vitality to the purposes of teaching and research. Within a few years of his appointment at Swansea, he had established an honours school of algebra which was outstanding, and it was perhaps unfortunate that so few research students came to Swansea to take advantage of this. While at Swansea he established a tradition of good teaching at all levels in both pure and applied mathematics, and played a considerable part in the development of the College in its formative period, so that many departments besides his own owe much to the traditions he helped to establish.

Prof. Richardson's standards in life were exceptionally high and he was a staunch and generous friend to many. He will be gratefully remembered by the students of the inter-war generations and by his colleagues, who will treasure the memory of his friendship and the hospitality which he and his wife dispensed at Highmead. He is survived by his wife, Dr. Margaret E. A. Richardson, a distinguished linguist and past member of the Swansea staff, whom he married shortly after his appointment to the chair of mathematics.

I am indebted to Prof. D. E. Littlewood, of the University College of North Wales, Prof. Richardson's pupil and collaborator, for his assistance in drawing up an appreciation of the publications in algebra.

R. WILSON

Prof. Douglas McCandlish

DOUGLAS MCCANDLISH, emeritus professor of leather industries in the University of Leeds, who occupied that chair during 1919–49, died at his home in Leeds on December 18. His passing is a sad break in the traditions of this unique Department.

He was born in Leeds on November 5, 1883, of Scottish parents, and joined the staff of Mr. Thomas Fairley, the city analyst of Leeds, on leaving the Leeds Boys Modern School. In 1902, he entered the Yorkshire College and graduated with honours in chemistry in the first degree list issued by the University. He then became demonstrator in the Leather Industries Department. After two years, he decided that he must link up his scientific knowledge with the actual manufacture of leather, and so became chemist to William Paul, Ltd., of Leeds. A year later he accepted an appointment as chief chemist to Messrs. A. F. Gallun and Sons, one of the largest and most scientifically minded tanning companies in the United States of America.

When McCandlish succeeded the late Prof. H. R. Procter in the chair of leather industries in the University of Leeds at thirty-six years of age, he was the youngest professor to be appointed at the University. For thirty years he gathered around him a body of students and research workers, being ably assisted by the late W. R. Atkin, who succeeded him, and the late F. C. Thompson.

Among his contributions to leather science, McCandlish's famous paper on the control of chrome tanning by means of the precipitation point may be mentioned. The Procter–McCandlish method of determining the basicity of chrome tanning liquors is also still being used. He devised a means of counteracting the well-known decay in leather-bound books and furniture, and was instrumental in producing upper leather for boots and shoes which could be decontaminated after exposure to war gases

McCandlish acted as honorary treasurer of the International Society of Leather Trades' Chemists for many years and was appointed president in 1925 He was elected an honorary member of the Society, and also of the American Leather Chemists Association. Among other appointments he held were those of dean of the Faculty of Technology (1938–40), president of the Leeds Caledonian Society (1930–33), chairman of the Appeals Tribunal of the National Assistance Board (Leeds Area) and member of the Conscientious Objectors Tribunal (North-Eastern Area).

Douglas McCandlish was a man of great kindness and will long be remembered by his old students and many friends for his kindly jovial disposition, his readiness to help in times of difficulty, his sound judgment, his work as a trustee of the Belgrave Congregational Church in Leeds, his wide knowledge of leather science and the leather industry, and as a bulwark in maintaining the prestige of the Leather Industries Department of the University of Leeds for so many years

He leaves a widow and a son, Dr A. J McCandlish, who is a medical practitioner at South Milford.

Donald Burton

NEWS and VIEWS

Manchester College of Technology: Prof H Lipson

As part of the programme of expanding the Manchester College of Technology, several new professorial chairs have been created For many years there has been a Department of Physics in the College, but until recently it has been regarded as a service department, it is now proposed to expand it materially, and to raise the status of its head to that of professor Dr. H. Lipson, who has been head of the Department since October 1945, was recently elected to this new office He has been responsible for developing a new university course in applied physics leading to the degree of B Sc.Tech. Prof Lipson went to Manchester in 1936 to work under Prof. W L (now Sir Lawrence) Bragg, and was engaged on an investigation of alloy systems, while at the same time he continued his work on the physical aspects of X-ray diffraction. In 1937 he accompanied Prof Bragg to the National Physical Laboratory and later to the University of Cambridge as an assistant in experimental research in crystallography. In 1939, he was awarded the degree of D.Sc. of the University of Liverpool Prof Lipson has for many years concerned himself with the study of X-ray crystallography, and for the past five or six years he has concentrated his efforts on the development and application of a new optical technique for he interpretation of X-ray spectra, a technique which exploits the fundamental similarity between X-rays and light He has designed a spectrometer or this purpose, and the instrument and his techniques have been copied in many other universities nd research institutions all over the world. It is hoped that his Department will shortly be equipped with a new and much larger version of this apparatus which will materially improve the facilities available or this work It is proposed in the near future, in addition, to develop a new section of the Department which will concern itself with the study of solid-state physics

Dr. M Gordon

A fellowship in textile chemistry in the College f Technology, Manchester, was instituted in 1954, as the result of a gift by Courtaulds, Ltd., and Dr Manfred Gordon, who has recently been appointed to he fellowship, will take up his duties in the summer of 1955 The Research Fellow is to be attached to the Department of Textile Chemistry with the specific duty of engaging in, and encouraging, research in textile chemistry. The College has a long tradition of research in this field and a new dyehouse has recently been built and has been extensively equipped with up-to-date machinery for the bleaching, dyeing, printing and finishing of cloth New research laboratories have also been provided and furnished with apparatus and equipment for the investigation of fundamental problems arising in those processes. Much of the machinery and apparatus has been purchased out of a gift from Messrs Courtaulds. Local industry has not only encouraged this provision but is also actively associated in the development of the new facilities

Dr Gordon is a lecturer in the Royal Technical College, Glasgow, following lengthy industrial research experience in the Chemical Research Division of the Dunlop Rubber Co., and is at present engaged on research work on high polymer chemistry He brings to this new research post a fund of knowledge of industrial research requirements, and acknowledged ability as a director of research projects such as those envisaged in the creation of the fellowship

Fellowships of the College

The College of Technology, Manchester, has recently initiated fellowships to be awarded in recognition of research carried out mainly by those who may have no university degree but possess the associateship of the College. A candidate must have been an associate for at least three years and must present a thesis based on original research, and he will be required to present himself for examination. Further information can be obtained from the Principal, College of Technology, Manchester 1.

Assistant Director of the U S. National Science Foundation: Mr. J M Mitchell

Mr James M Mitchell has been appointed assistant to the director of the National Science Foundation, Washington (Dr. Alan T. Waterman) Mr Mitchell's responsibilities will be largely concerned with the Foundation's programme of fact-finding studies on scientific activities and man-power in government, industry and universities. He is at present deputy assistant secretary of defence. He graduated from George Washington University and also did graduate work at the University of Michigan. He has served as a management consultant, personnel officer and administrator in Federal, State and local governments. During 1940–48 he was executive director of the Civil Service Assembly of the United States and Canada, where he also served as editor of *Public Personnel Review*, and was a member of the United States Civil Service Commission during October 1948–April 1953. He has been a lecturer at the University of Michigan, University of Chicago and Northwestern University.

The Patent Office: Mr. H. S. Gilham

MR. H. S. GILHAM has been appointed assistant comptroller in the Patent Office to take charge of Patents in succession to Mr. J. Norman Brown. Mr. Gilham joined the Patent Office staff as an assistant examiner in 1920 and, except for secondment on duties connected with the Second World War, has served continuously in progressive ranks of the Patent Office examining staff. He served with the Royal Engineers (Special Brigade) and later with the Royal Garrison Artillery in the First World War. He was educated at Queen Elizabeth's School, Gainsborough, and Queen Mary College, University of London (Drapers Scholar). Prior to his present appointment, Mr. Gilham was a superintending examiner in charge of a division of examining staff.

A.R.C. Unit of Reproductive Physiology and Biochemistry

THE Agricultural Research Council, in agreement with the University of Cambridge, has established at Cambridge a Unit of Reproductive Physiology and Biochemistry. Dr. T. R. R. Mann, reader in the Department of Veterinary Clinical Studies, has been appointed director of the Unit. There will be two deputy directors, namely, Dr. A. Walton and Mr. L. E. A. Rowson. Mr. Rowson is also director of the Artificial Insemination Centre of the Cambridge and District Cattle Breeders, Ltd., his services to the Unit will, therefore, be part-time.

Journal of Geophysical Research

IT is reported in the September (59, No. 3, 1954) issue of the *Journal of Geophysical Research* that in spite of substantial subsidies, both in time and money, it has been found impossible to continue to maintain a proper standard of publication without considerable monetary loss. Indeed, recently, in order to reduce costs, several worth-while articles have either had to be refused or delayed substantially in publication. Accordingly, it has been decided to increase the subscription-rates and page-charges of the *Journal* as from the beginning of volume 60 (1955). The new rates are six dollars per annum or two dollars for single copies, the page-rate to the author's organization, to cover partial cost of publication, is eight dollars. The *Journal of Geophysical Research*, it will be recalled, is the continuation of *Terrestrial Magnetism and Atmospheric Electricity*, which had a continued run from 1896 to 1948. It is an international quarterly devoted to the fields of terrestrial magnetism and atmospheric electricity, the ionosphere, solar and stellar phenomena, the upper atmosphere, and special investigations of the earth's crust and interior.

Chemical–Biological Coordination Center, Washington, D.C.

THE Chemical–Biological Coordination Center of the National Research Council was established on July 1, 1946, for research into practical problems involved in assembling and making available information on chemicals and their varied effects on biological systems (including the structures o chemicals, and responses of living organisms, or thei functional units, to chemicals), the fate of chemical introduced into a living system and mechanisms o drug action. The Center is also intended to serve a a repository of information on chemical constitutio and biological activity, both published and unpublished or inaccessible data, and to answer appropriat questions and to sponsor preliminary testing o 'screening' of compounds in this field. A brochur describing the activities of the Center, which i responsible to the executive board of the Nationa Research Council, Washington, D.C., has now bee issued by the Council on behalf of the Center (pp. 33 1954). Besides a list of staff, of publications, and o the screening agencies which carry out the screenin tests, the brochure describes the operation of th Center, including the preparation of the code shee on which information is recorded for each chemical the chemistry and biology codes used by the Cente and the way in which the punched cards and th Center's files are used for answering questions. Th type of questions which the Center will attempt t answer is clearly indicated: they must be concerne with chemical–biological data or sources of chemical required in biological investigations. Complet bibliographies cannot be provided, and question must be formulated so as to be clear, concise, unambiguous and to narrow and define the range o the search requested.

Fossil Mammals of Africa

A RECENT addition to the series of publication issued by the British Museum (Natural History) o the fossil mammals of Africa is No. 8, "An Annotate Bibliography of the Fossil Mammals of Afric (1742–1950)", by A. Tindell Hopwood and J. P Hollyfield (London: Brit. Mus. (Nat. Hist.), 1954 45*s*.). The bibliography is based upon the author working list, and is annotated for zoologists interested in the comparative anatomy, distribution an history of the mammalian faunas of Africa, rathe than for geologists and archæologists. All specie mentioned in each publication cited are listed, an the locality and geological horizon given; sometime an author's opinion is summarized and occasionall a direct quotation is given. The writers' own opinion and comments are concise and informative. Th bibliography is followed by a geographical index fro which anatomical and zoological papers have bee omitted unless they are also of faunistic or stratigraphical interest; a complete systematic index o which the classification is based, with minor alterations, upon that proposed by Simpson in 1945; an a nominal index. This carefully compiled guide t the literature dealing with the fossil mammals o Africa, with its most useful comments, will b invaluable to all workers on the subject, and wi spare them many hours of plodding literary researc

Soil and Vegetation Maps of the Belgian Congo

THE attention of readers is directed to a series o fascicles containing land-usage maps published b the Institut National pour l'Étude Agronomique du Congo Belge—"Carte des Sols et de la Vegetation du Congo Belge et du Ruanda-Urundi" (Brussels, 1954) Each fascicle contains a soil and a vegetation map in colour and an explanatory memoir In No 6, which relates to Yangambi, the site of the Institute's main research station, the descriptive matter includes an account of the geology, geomorphology, climate, human and economic geography of the region, together with a classification of the several soil series and of the principal types of vegetation and a bibliography In another of these fascicles, relating to the Mvuasi region in the Bas-Congo, the correlation between soil and vegetation and the utilization of the several classes of soil are considered in some detail

Marsilea Experimental Induction of 'Water' and 'Land' Forms

SPORELINGS of *Marsilea drummondii*, grown aseptically in various concentrations of sugars, especially glucose, have been investigated morphologically and anatomically The results are important in that they shed new light on the factors determining the characteristic features of leaves in water and land forms (A Allsopp, *Ann Bot*, 18, 72, 449, 1954) Corresponding to the features of the external morphology, the anatomy of sporelings from low sugar concentrations (1 and 2 per cent glucose) has many characteristics of the water forms of amphibious plants, while that of sporelings from higher sugar concentrations (4 and 5 per cent glucose) has the characteristics of typical land forms It has been shown that the 'water' forms are not merely reduced forms arising by inhibition of the development of a more complete land form In particular, the direction and duration of cell-division are different in the rhizome apices of the two types of sporeling The view is advanced that the differences between land and water forms are not a result of changes in carbohydrate nutrition, but, in the experimental conditions described, arise in response to differences in the osmotic concentration of the culture medium, which are analogous to the differences in availability of water in normal aquatic and terrestrial conditions.

Laboratory Furnaces

CATALOGUE No 558 (August 1954) issued by Messrs A Gallenkamp and Co, Ltd, 17–29 Sun Street, London, E C 2, describes the wide range of electrically heated wire-wound muffle and combustion types of laboratory furnace now manufactured and available from this Company The Gallenkamp method of construction was originally patented in 1914 and, after the patent rights lapsed, was copied by many other makers The design of all Gallenkamp furnaces has recently been carefully reviewed, and as a result the new catalogue lists an augmented range of furnaces, modern in appearance and incorporating the latest methods of control but maintaining the original features of reliability and long life which have made these furnaces so successful during the past forty years. Asbestolite, instead of sheet steel cases, is now used, and the high-quality wire-wound elements are external to the muffles and tubes so that they are protected from fumes and gases which may arise inside a furnace during operation. Muffle furnaces for use at 1,000° C. are fitted with a silver temperature fuse to protect the winding from accidental overheating Various types of furnaces for general purposes such as incinerations, heat treatments, combustions, ash and fusion-point determinations, dental work and vitreous enamelling, together with indicating, controlling and recording pyrometers are described and illustrated

Bibliography of Seismology

VOL. 14, No. 13, of this important work on pure and applied seismology, for the period January–June 1953, has recently been received It is published by the Dominion Observatory, Ottawa, and edited by W. E. T Smith, who regularly searches seventy-one listed publications This number of the bibliography contains 188 items from all parts of the world, including the following items No. 8163, "Deep Seismic Sounding in the Earth's Crust", G A. Gamburtsen (*Akad Nauk S S S R Vestnik*, No 4, 113, 1952); No. 8168, "Predicting the Sites of Earthquakes from Seismic and Geologic Data", I E Gubin (*Priroda*, No 4, 55, 1952), No. 8257, "Results of Seismic Observations in Germany on the Heligoland Explosion of April 18, 1947", H Reich, O Förtsch and G. A Schulze (*J Geophys Research*, 56, No 2, 147, 1951)

Institute of Personnel Management: Annual Report for 1953–54

THE annual report for 1953–54 of the Council of the Institute of Personnel Management (pp 19, from the Institute, London), presented at the annual meeting on October 9, 1954, notes the continued emphasis on the reduction of costs and the success of efforts to stimulate interest in method study and work measurement It claims that the most significant development has been the growth of an open-minded approach towards management practices, a willingness to analyse existing systems and procedures in the light of basic aims and principles, and a realization that no existing state of efficiency is incapable of further improvement Much attention has been given to the relation between personnel management and the needs of industry and commerce, and special efforts have been made to develop the Information Service The decision to introduce an external examination scheme as a means of qualification for membership marks the culmination of many steps taken over the years to realize an important object of the Institute While the Institute itself has been unable to undertake research, it has contributed to several research projects and has been represented on the steering committees discussing three research projects being planned by the British Institute of Management—on absenteeism, the cost of labour turnover, and financial information for employees

Medical Research Council Travelling Fellowships

APPLICATIONS are invited for Medical Research Council Travelling Fellowships for the academic year 1955–56 The Rockefeller Fellowships are intended for graduates resident in Great Britain who have had some training in research work in clinical medicine or surgery, or in some other branch of medical science, and who are likely to profit by a period of work at a centre in the United States or elsewhere abroad, before taking up positions for higher teaching or research in the United Kingdom The Fellowships will normally carry a maintenance allowance at the rate of 2,700 dollars a year for a single Fellow and 3,900 dollars for a married Fellow. Provision will also be made for travelling and other approved expenses The Dorothy Temple Cross Research Fellowships in Tuberculosis are intended to give special opportunities for study or research to suitably qualified British subjects of either sex "intending to devote themselves to the advancement by teaching or research of curative or preventive treatment of tuberculosis in all or any of its forms" The Fellowships will, as a rule, be awarded to candidates who wish to make their studies or inquiries elsewhere than in the United Kingdom They provide for the payment of a maintenance allowance at the rate of £650 a year for a single Fellow and £900 for a married Fellow, in addition, an allowance will be made for travelling and other approved expenses Further particulars can be obtained from the Secretary, Medical Research Council, 38 Old Queen Street, Westminster, S W 1, with whom applications must be lodged not later than March 15

Oil and Colour Chemists' Association

THE 1955 Conference of the Oil and Colour Chemists' Association will be held at Llandudno during June 7–11. Most members will be accommodated at the Grand Hotel, where the technical sessions, under the general title "Film Structure and Adhesion", will be held

The seventh Technical Exhibition of the Association will be held during March 15–17 at the Royal Horticultural Society's Old Hall, Vincent Square, London, S W 1. Further information can be obtained from the General Secretary, Oil and Colour Chemists' Association, Memorial Hall, Farringdon Street, London, E C.4.

The British Instrument Industries' Exhibition, 1955

THE third British Instrument Industries' Exhibition will be held at Earls Court, London, during June 28–July 9 Concurrently with this Exhibition, there is the tenth International Printing Machinery and Allied Trades' Exhibition at Olympia, and in view of the rapidly growing importance of instrumentation to the printing industry, visitors to this will have the advantage of studying both modern printing machinery and the appropriate field of instrumentation, including temperature control

University of Birmingham

DR T L. IBBS has been awarded the personal title of professor and has been appointed to administer the Department of Physics from January 1, 1955, to September 30, 1956, in order to release Prof P. B. Moon for duties in connexion with the research programme of the department

A grant of £2,000 a year for three years has been accepted from the Aero Research Company for fundamental work on fluorine compounds in the Department of Chemistry

The title of University Research Fellow has been conferred upon Dr C A. Diaz Floris during the tenure of his present post in the Department of Chemical Engineering

Announcements

WE regret to announce the death on January 30 of Sir Edward Mellanby, lately secretary of the Medical Research Council, aged seventy.

DR. R A. LYTTLETON, of St John's College, Cambridge, has been awarded the Hopkins Prize of the Cambridge Philosophical Society for his work on comets and on the stability of rotating liquid masses. The Prize, which is of value £90, has been awarded every three years since 1867 for work in mathematical-physical or related fields The last recipient was the late Sir John Lennard-Jones

SIR CHARLES DODDS, Courtauld professor of biochemistry in the University of London and director of the Courtauld Institute of Biochemistry at the Middlesex Hospital, has been appointed a member of the Advisory Council for Scientific and Industrial Research, to fill the vacancy caused by the retirement of the late Sir Wallace Akers in September 1954

PROF. S. DEVONS, professor of physics in the Imperial College of Science and Technology, London, since 1950 (see *Nature*, **164**, 1033, 1949), has been appointed Langworthy professor of physics and director of the Physical Laboratories, University of Manchester He thus succeeds Prof P. M S Blackett, who accepted a chair in the Imperial College in 1953

DR H M STANLEY has been appointed controller of research and development of the Distillers Co , Ltd , in succession to Dr F Roffey, who remains technical director of the Company and has taken on the additional duties of personnel director of the Company's Industrial Group

TRINITY COLLEGE, Cambridge, is offering Entrance Exhibitions to students of universities in the British Commonwealth These are confined to those who propose reading for a B A. (honours), LL B. degree or a diploma. The awards are not intended for research students Each Exhibition is of the titular value of £40 a year The College is also offering a Research Studentship The value will depend on the student's income from other sources , if there are no other emoluments, the Studentship will be £425 a year. Further information can be obtained from the Senior Tutor, Trinity College, Cambridge

AN International Ore-dressing Congress will be held under the auspices of the Gesellschaft Deutscher Metallhutten- und Bergleute in Goslar (Harz) during May 8–11 Further information can be obtained from W Koch, Gesellschaft Deutscher Metallhutten- und Bergleute, Clausthal-Zellerfeld 1 (Germany), Postfach 51

AN International Congress on Materials for Aircraft and Guided Missiles will be held in Paris under the auspices of the Association pour l'Encouragement à la Recherche Aéronautique during March 28–April 1. Further information can be obtained from M. P Lefranc, délégué technique, Association pour l'Encouragement à la Recherche Aéronautique, 1 rue de Courty, Paris 7.

THIS year is the fortieth anniversary of the publication by Prof Hugh Ryan, of University College, Dublin, of his first paper on flavone chemistry. Since that time the subject has been actively pursued in Dublin under the direction of Profs T. J. Nolan, J Algar and T S Wheeler To mark the anniversary, University College, Dublin, is organizing a symposium on "Recent Advances in the Chemistry of Naturally Occurring Pyrones and Related Compounds", to be held during July 12–14 The title is to be widely interpreted and includes flavones, flavanones, *iso*-flavones and coumarins The Royal Dublin Society will consider contributions to the symposium for publication in its *Proceedings* Further information can be obtained from Mrs. Eva M. Philbin, University College, Science Buildings, Upper Merrion Street, Dublin

THE NATIONAL FOOD SURVEY IN GREAT BRITAIN

THE Nutrition Society held a symposium at the Middlesex Hospital Medical School on November 20 on the National Food Survey of Great Britain. A series of six papers was presented on various aspects of the Survey.

In his opening remarks the chairman, Dr. N. C Wright, chief scientific adviser of the Ministry of Food, referred briefly to the purposes for which the Survey was started in 1940 and to the changes in objective and scope which had taken place since its commencement The Survey was not designed to provide information which would enhance scientific knowledge in its narrower sense. It was initiated, in the climate of the 30's, against a background of the poorer diets which pre-war surveys had demonstrated in certain sections of the British population, and it was planned to provide administrators with early warnings of any dietary inadequacy from war-time shortages or changes in dietary pattern—particularly among those who were thought to be most vulnerable nutritionally In this context it was assumed that the effectiveness of the war-time food policy would be most clearly reflected in the food consumption and expenditure of urban working-class households. The records of such households were published in 1951 as the first report of the National Food Survey Committee under the title "The Urban Working-Class Household Diet, 1940–49"[1] and as a supplement to the first annual report of the Committee published in 1952—"Food Expenditure by Urban Working-Class Households, 1940–49"[2]

With the termination of the Second World War and the end of the immediate post-war shortages, it became clear that if the Survey was to provide a basis for guidance on food policy which would take into account the changing circumstances of different groups of the population, its scope must be widened. Accordingly, in 1950 it was arranged that records should be obtained from a complete cross-section of the population and thus facilitate, *inter alia*, the identification of any groups the diet of which appeared to need attention

The results of the Survey for the years 1950–52 have been published in a series of annual reports of the National Food Survey Committee under the general title "Domestic Food Consumption and Expenditure"[3]. In the first paper of the symposium, W L Readman referred to the three annual reports as sources of information on technique up to 1952, and described improvements in sample design which have since been introduced. Addresses are now selected from more than a thousand polling districts in two sets of thirty parliamentary constituencies chosen to ensure correct regional representation. The time-tables of interviewers are arranged so as to allow opportunity for persistent re-calls on the more elusive housewives Evening interviewing has been introduced These efforts, combined with the discontinuance of a former practice of weighing larder stocks, have resulted in an improved response-rate 56 per cent compared with 37 per cent quoted in the 1952 report The tendency for children to be somewhat over-represented in the sample has also been reduced. Thus, with the new method children aged 0–9 form 18 9 per cent of the sample compared with 22 5 per cent in 1950. Mr Readman also discussed the use of the income of the head of the household as an indication of social class, and referred to the recent checks which have been made on social class distribution by reference to the 'juror index' He gave some information about the coefficients of variation of nutrient intake, which have been found to be greater for certain vitamins than for other nutrients and to decrease as the size of the household increases.

In the second paper, entitled "Economics, Nutrition and Family Food Budgets", J A C Brown discussed the team-work required to conduct and interpret a survey of this kind and the place of the economist in the team He suggested that the economist's task is to determine the most important influences affecting food purchases, and gave estimates of income elasticity of the demand for foods in Great Britain based on the results of the pre-war Ministry of Labour survey and the National Food Survey He also demonstrated the relationship between family composition and food expenditure, and discussed consumer saturation for different commodities and the possibility of using such information as an indication of the effects of social policies.

The third paper, by Miss D. F. Hollingsworth, dealt with the nutritional pattern of diet in Britain on the eve of derationing Using the findings of the 1936–37 Crawford and Broadley survey and of the 1952 National Food Survey, she compared the patterns of expenditure in five groups of foods—vegetables and fruit, milk and cheese, meats, fish and eggs, bread and cereals, and fats, sugar and other groceries She showed that the 1952 pattern represented an increase in the proportionate expenditure devoted to the so-called 'protective' foods which was exhibited in all social classes approximately one-third was spent on vegetables, fruit, milk and cheese, one-third on meats, fish and eggs, and one-third on bread, other cereals, fats, sugar and other groceries. She then discussed the trends for groups of foods which were not rationed in 1952, namely, milk, bread and flour, vegetables and fruit, and fish, since it seemed that these might provide some indication of possible patterns of food consumption by different types of households under conditions of complete freedom from rationing.

The next two papers were concerned with more specialized aspects of the survey results In the first, A. H J Baines and Miss Hollingsworth presented data relating to the diets of elderly women (aged fifty-five or more) living alone. Milk consumption was well maintained at a figure above the national average. There was a preference for butter over margarine, and for mutton over beef—a fact which (taken in conjunction with the consumption of potatoes and onions) appeared to indicate a partiality to stews The consumption of bread was below the national average, but tea consumption was about 50 per cent above it In the higher age groups oatmeal was preferred to other breakfast cereals. In line with accepted requirement figures, the total energy value of the diet fell as age advanced, but was always well above recommended allowances. Intakes of all the remaining nutrients were also above the recommended levels, except for iron, which (if present requirement figures are accepted) was just marginal In the second of the two more specialized papers, Mrs. E H. Gibson, W. L Readman and

Miss G. M Warnock discussed food and family size. An analysis of the effect of children on food expenditure had already been published in the 1952 report of the Survey in the paper presented at the symposium, this analysis was extended to cover food consumption Moreover, by means of regression estimates it was also found possible to arrive at 'notional' figures for the food consumption and nutrient values of the diets of adults and children respectively, and to apply these to families containing varying numbers of children

In the concluding paper, Dr. I Leitch, director of the Commonwealth Bureau of Animal Nutrition, reviewed the day's proceedings and made comparisons between the findings of the pre-war Carnegie survey (the welcome publication of which she announced to be imminent) and those of the National Food Survey She suggested a number of points in the preceding papers which required further examination, mentioning as examples the extent of wastage of food in households of different composition and the influence of the occupation of the male earner on their consumption patterns She stressed the need for further economic analyses of the results of the National Food Survey and emphasized its great potential value.

The symposium included two sessions for discussion The first covered a wide range of subjects which related chiefly to technique Points were made on methods of assessing social class, the intelligence-levels of informants who did and did not co-operate in the Survey, the degree of variance in the results, the contribution of school meals, the pattern of family shopping and the distribution of food within the family. The second included more detailed questions relating to the later papers, for example, the extent to which domestic pets might account for the excess of intake over requirements in the homes of elderly women, and the extent to which the pre-war Carnegie survey results might be directly compared with those of the National Food Survey

The symposium was thus not only of value in giving members of the Nutrition Society a fuller picture of the National Food Survey than can be gleaned from the published reports. It equally provided those responsible for the detailed work of the Survey with an opportunity of viewing the results against a wider background and of benefiting from the lively discussion and constructive criticisms of an interested and informed audience.

GEOPHYSICAL ASPECTS OF SOLAR FLARES

In recent years the study of solar flares has become of interest to geophysicists and astronomers alike To the geophysicist, the subject is of interest chiefly because of the direct information it can provide concerning the study of solar–terrestrial relationships. It was this particular aspect which formed the subject of the Geophysical Discussion held at the Royal Astronomical Society on November 26, at which the chair was taken by Prof V. C A Ferraro.

Carrington's classical observation of a flare was made on September 1, 1859 But solar flares are seldom seen in the integrated light of the sun, and it was not until methods had been devised many years later for observing the sun's surface in monochromatic light that a systematic study of solar flares was made possible Since then much information has been obtained, and the Geophysical Discussion dealt principally with the geomagnetic, ionospheric and radio influences of solar flares.

Mr H W. Newton (Royal Greenwich Observatory) described by means of slides the chief characteristics of solar flares so far observed. Their basic association with sunspots, their sudden appearance and short life relative to sunspots, their great extent for those of first magnitude, and certain repetitive features are of significance in studying their geophysical effects In particular, the distinctive development curve of typical flares with its high and brief peak (flash of radiation) should be noted

Two types of effects are recognizable (1) from solar electromagnetic radiation, producing effects on the day hemisphere , and (2) from solar particles affecting both day and night hemisphere The former include the geomagnetic crochet, the short-wave radio fade-out, the long-wave improved transmission and solar 'noise' A number of crochets synchronous with great flares have been used in conjunction with the observed maximum of the visible light ($H\alpha$ usually) to give a time-interval (effective time of travel from sun to earth) to the 'sudden commencement' of the ensuing geomagnetic storm. A histogram, of 5-hourly intervals over the 72 hr following the crochet, shows a distinct peak at the interval 17–21 hr The average from all the data was nearly 30 hr , the most active storms giving a significantly shorter interval of 22 hr These results, Mr Newton concluded, confirm and extend the purely statistical relationship between the greater sunspots and the greater geomagnetic storms , but flare occurrence does not explain a large proportion of the smaller storms, namely, those with indefinite onset and a tendency to recur at intervals of twenty-seven days. For these storms, the corona has to be invoked, but results so far lack coherence

Mr J S. Hey (Radar Research Establishment, Ministry of Supply, Malvern) described an analysis of the distribution across the solar disk of solar flares with associated radio bursts at $\lambda = 4\ 1$ m In an analysis of observations during part of 1946–47, it was noticed that radio bursts occurred more frequently in association with flares on the eastern half of the solar disk than on the western half, and it was tentatively suggested that the asymmetry might be due to absorption in solar corpuscular streams

Subsequent observations of radio bursts up to 1951 have confirmed the radio asymmetry If the supposition that the asymmetry is caused by absorption in corpuscular streams is correct, it seems probable that a correlation should exist between the distribution of radio bursts and high geomagnetic activity, which might be taken as an index of the arrival of solar particles in the earth's atmosphere.

Recent analysis has indicated that the active solar regions which produce high geomagnetic character figures also have high radio-burst activity , and if the progress of these regions is followed as they cross the solar disk, it is found that the radio-burst activity is a maximum to the east, falls toward central meridian, and rises again slightly on the west However, as the anomalous distribution of radio-burst activity tends to occur for all values of magnetic activity, the absorption is not restricted to regions from which corpuscular streams have sufficient velocity to reach the earth.

The question then arose as to whether the asymmetry in the distribution of visual solar flares might be caused by optical absorption, since it is feasible that both radio and optical absorption effects could occur Analysis of distribution of solar flares observed in Hα during the years 1947–50 showed that the asymmetry was more marked when those flares occurring within a few days of high geomagnetic activity were selected The results strongly suggest that the asymmetry both in the distribution of flares and in radio-bursts associated with flares is an absorption effect, which is emphasized by the selection of observations in close relation to high geomagnetic activity.

Dr M A Ellison (Royal Observatory, Edinburgh) dealt with the flash of ultra-violet radiation generated by a flare giving rise to sudden disturbances in the terrestrial ionosphere, known collectively as S I.D.'s These disturbances are confined to the illuminated hemisphere of the earth and may be recorded in a variety of ways We do not yet know what wave-lengths are involved. We speak of the S I D 's as the 'simultaneous effects' of flares But, in fact, accurate timings show that they are not quite simultaneous with the flash of visible radiation, as observed in Hα light, there is a lag of some minutes between the peak of the flare and the maximum of the ionization which results from it

The extra ionization caused by a flare is believed to be confined to the D-layer, in the level 60–90 km., and the study of the various time-delays yields valuable information about the processes which occur in this region

The S I D 's are recorded in the following ways (1) crochets in terrestrial magnetism (conductivity effect), (2) short-wave radio fade-outs (S W F) 5–15 Mc/s and cosmic noise fade-outs (S C A) 18 Mc/s (absorption effects), (3) sudden phase anomalies (S P A) of very long radio waves 16 kc./s (lowering of D-layer reflecting ceiling), (4) sudden enhancements of atmospherics (S E A) 27 kc/s (improved reflectivity of D-layer at oblique incidence), (5) sudden anomalies in the field-strength (S F A) of a distant 16-kc/s transmitter (interference between ground-wave and sky-wave from D-layer)

At Edinburgh the development curves of the S.I D 's have been compared with those of the flares which generate them The development curve of a flare consists of a plot of Hα line-width, or of central intensity, versus time Either method yields the same values for the times of beginning, maximum and end of the flare The results for the time-delays are as follows

	S I D. max –flare max	No of cases
(1) Crochets	2 5 min	13
(3) S P A	5	8
(4) S E A	7	21
(5) S F A	5	8

The standard error in each case is of the order of 1 min In addition, it was found that after an intense flare (Class 3 or 3+) the ionization in the D-region does not return to the pre-flare value for a period of the order of 1 hr after all visible radiation has ceased

It is natural to suppose that the intensities of the visible and ultra-violet wave-lengths in the flare radiation follow the same course of rise and decay with time, even though only the former can be directly observed It was therefore assumed that the observed time-delays are to be interpreted as 'relaxation times', due to the sluggishness in the response of the D-layer to the increase in ionizing radiation

It follows from this that the number of free electrons at this height increases during a flare by five to ten times the normal value This result is in good agreement with the value derived by Appleton and Piggott from the increase of absorption which is observed during a short-wave fade-out

The relatively small time-delay for the maximum of the crochet is a most significant feature, it appears to indicate that the crochet currents do not flow at the same level (70–75 km.) as that in which the sudden enhancement of atmospherics and sudden phase anomalies effects originate. It is now generally believed that the S_q currents, responsible for the magnetic daily variation, flow at a height of 100–120 km. The crochet currents are in the same sense as the S_q currents flowing at the time and appear as an enhancement of these currents But this does not necessarily mean that both are located at the same level. Referring to his 1950 paper, Dr. Ellison remarked upon the following facts (1) Crochets are associated with intense flares (Class 3+ and 3, and only rarely with Class 2 flares). (2) The radiation from lesser flares (Class 1 and most Class 2) is known to produce ionization at heights of 70–75 km, as shown by the associated sudden enhancement of atmospherics and sudden phase anomalies. This radiation must have traversed the E-layer, yet it produces no increase in conductivity (that is, no crochet is observed) (3) The crochet only occurs during deep ionization of the D-layer, that is, when the 15-kc/s reflecting ceiling for sudden phase anomalies falls from 75 km to about 65 km. or lower. (4) Only the more intense fade-outs (about one in three) are accompanied by crochets (5) The duration of the crochet is much less than the duration of the ionization in the 70–90 km level, as recorded during the same flare by radio methods This indicates a higher recombination coefficient, that is, lower level

For these reasons Dr Ellison concluded that the crochet currents must be the result of an increase in conductivity at a low level of about 60–70 km

Again, the crochet currents associated with an intense flare are such as to indicate an increase in conductivity by a factor of less than 2, if we assume that they are caused by simple enhancements of the existing S_q currents. On the other hand, the fade-out absorption during a flare shows that the electron population in the absorbing layer (70–90 km) undergoes an increase of five to ten times. This fact, together with the short time-delay for crochets and the absence of crochets in association with lesser flares, suggests that the 70–90 km level does not make an appreciable contribution to the crochet current-system

The evidence, therefore, points to the formation of crochets through the establishment of an independent current system in the base of the D-layer, the ionization at this level (~ 60 km) being enhanced only during an intense flare

Dr K Weekes (Cavendish Laboratory, Cambridge) next discussed the ionization produced in the ionosphere during a solar flare From observations of the changes of height of reflexion and absorption of waves of radio-frequency near 2 Mc./s. and from the sudden phase anomalies observed with very long radio waves, Dr. Weekes stated that it is possible to make deductions about the distribution with height of the ionization produced during the solar flare. These lead to the conclusion that the greater part of the extra ionization is produced in the lower E-region between 95 and 100 km. The increased absorption appears to be due to a more or less independent production of ionization near 70 km. which also gives rise to the effects observed with very long waves.

The variation of the various phenomena with time allows tentative deductions about the ionizing radiation and about various parameters in the ionosphere.

Finally, Dr. H. Elliott (Imperial College of Science and Technology, London) discussed the increases of cosmic rays observed during intense solar flares. He first remarked that during the past seventeen years there have been four occasions on which increases in cosmic ray intensity have been observed at a number of widely separated stations at the time of an intense solar flare. The magnitude of the increase depends on latitude, local time and height above sea-level. On none of these occasions was any increase observed at Huanayo near the geomagnetic equator, and this leads to the conclusion that the primary particles responsible for the increase are charged and have a maximum energy rather less than 10^{10} eV. In addition to these large increases, which have amounted in some cases to more than 100 per cent, it has now been established that smaller increases of the order of 1 per cent occur at the time of less intense flares. Assuming that the primary particles come from the sun, the impact zones on the earth can be calculated by taking into account the deflexion in the earth's magnetic field. Firor has shown that there is rough agreement between the observed and calculated intensity distribution over the earth, which indicates that the particles come from a region on or near the sun.

In the short discussion that followed, Prof. Ferraro directed attention to the interest for the theorist of Dr. Ellison's conclusion that the crochet currents flow at a level of about 60–70 km. For the question now arises as to whether one can account for the electromotive force needed to drive the crochet currents. Attention was also directed to the fact that no corpuscular radiation associated with solar flares other than that with speeds of about 10^8 cm./s. and 10^{10} cm./s. has so far been detected. We must await further developments to see whether this is, in fact, the case, or whether there is a continuous velocity spectrum in the corpuscular radiation ranging from about 10^8 cm./s. to 10^{10} cm./s.

V. C. A. FERRARO

FIELD-EMISSION AND SURFACE PHENOMENA

SYMPOSIUM AT PITTSBURG

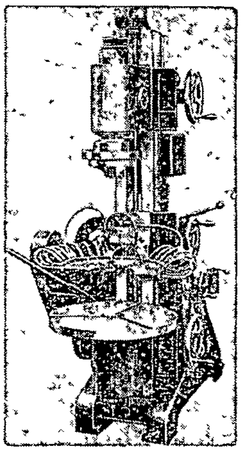
A SYMPOSIUM dealing with field-emission and surface phenomena was held at the Mellon Institute, Pittsburg, Pa., during November 10–12, and was attended by about eighty members. A banquet was held at the University Club, at which the guest speaker was Dr. W. E. Schoupp, director of development, Westinghouse Atomic Power Division, who spoke on power sources of the future. Dr. M. M. Wachtel (Westinghouse) was chairman of the Symposium Committee responsible for the excellent conference arrangements.

The first session, devoted to field-emission and electrical breakdown, was opened by a paper by F. Llewellyn Jones (Swansea, Wales) on problems of the cold liberation of electrons and discharge initiation. With fields ∼ 10^5 V./cm., two liberation mechanisms are found. One is dependent upon the presence of sites, for example, negative ions of water molecules, from which detachment occurs under the electric field; the removal of water vapour practically eliminates the emission. The other mechanism arises after the passage of a discharge, and apparently involves cold emission in a field enhanced by positive ions at a cathode tarnish layer; the role of such films was discussed. E. W. Mueller (Pennsylvania State) discussed emission due to momentary stripping of adsorption layers of barium, thorium and sodium with high electric fields up to 375 MV./cm. (field desorption). The field is sharply defined for any given adsorbate and depends on the crystallographic structure of the substrate. Auto-ionization can occur before the molecules touch the metal, and continuous field ion emission is made possible by surface migration to the emitting area. Application to mass-spectrometry was indicated. L. H. Germer (Bell Laboratories) discussed the role of field-emission for the extreme cases of breakdown under very high gas pressure and also *in vacuo*. For the former, the mechanism proposed is the field-emission of electrons following the Fowler–Nordheim equation in a field enhanced by the presence of positive ions near the cathode, the effective increase in the secondary coefficient γ thus corresponding to a lower sparking potential in the breakdown criterion. For vacuum breakdown, vaporization of the anode is suggested with ionization of the vapour atoms, the resulting positive ions enhancing the field of the cathode to produce field-emission. Experiments on a formative time-delay of high-vacuum sparks were described by H. G. Heard (California) using a pulse which rose in $6 \cdot 6 \times 10^{-10}$ sec. and of duration ∼ 5×10^{-9} sec. It was found that initiation of a vacuum spark depends on two effects: a current precursor, and its subsequent rise. The measured delays cannot be reconciled with any clumping or cathode heating mechanisms.

The next session dealt with electron and ion sources. The production of high-energy electron beams was described by L. Marton and R. A. Schrack (National Bureau of Standards). Field-emission offers an attractive source for certain electron optical applications, for high brightness and small virtual areas make field-emitters more effective than thermionic sources when spots less than 0·3 micron are desired. Application to small X-ray sources, electron-probe micro-analysis, and to the determination of composition and orientation in the micro-crystalline structure of metals was described. A paper entitled "Can One Observe Individual Atoms and Molecules in the Field Emission Microscope?" was read by J. A. Becker (Bell Laboratories). The discussion was concerned with the origin of very bright spots on the screen of a field-emission microscope, from the behaviour of which it is concluded that they originate in individual atoms or molecules adsorbed in a special state. M. G. Inghram and R. Gomer (Chicago) described a mass spectrographic analysis of the ions formed in hydrogen (and other gases) in the Muller field-ion microscope, the peak width for mono-energetic 10,000-V. ions was 20 V.,

Glass Working Lathes

The Universal model illustrated may be used either horizontally or vertically.



Heathway glass working lathes are the most widely used in Britain

There are five models to choose from. May we send you leaflets ?

Variational Principles in Dynamics and Quantum Theory

By WOLFGANG YOURGRAU, Dr Phil
and STANLEY MANDELSTAM,
B Sc (Eng), B Sc (Rand)

In this book, the authors deal with the mathematical foundations of Variational Principles and those sections of dynamics (such as the Hamilton-Jacobi theory) to which they are related The principle of least action is analysed also from a historical viewpoint, while an evaluation is attempted of the conflicting philosophical conclusions which eminent scientists have reached on this subject Allied topics discussed include an examination of the role of Variational Principles in the development of quantum mechanics, as well as the application of Hamiltonian methods to electrodynamics 25/- net

Introduction to Theoretical Mechanics

This text for physics graduate students provides a sound introduction to classical mechanics Emphasizing the solution of problems, the author aims to train the student to approach difficult problems in a confident and successful manner, and to accustom him to the procedures of physical reasoning The number of topics has been limited so that none is superficially treated Newtonian mechanics is emphasized in all but the last three chapters as the author feels that this aspect of the subject must be thoroughly mastered before the student is introduced to the short-cuts provided by the more generalized co-ordinate methods The latter procedures are treated in the last three chapters

The three-dimensional motion of rigid bodies is covered, and several applications to astronomy and atomic physics are presented in the form of problems Other topics not usually treated in a book of this nature include · non-linear vibrations , the motion of a body the mass of which varies (a rocket), generalized co-ordinates , vibrating systems of several degrees of freedom , a vibrating system having a large number of degrees of freedom—the vibrating string—treated both from the normal co-ordinate point of view and from the standpoint of travelling waves Worked-out examples and chapter-end problems are included

MACMILLAN BOOKS

Science and its Background

H D ANTHONY, M A (Cantab), B Sc, Ph D (Lond), F R A S.

Here is the story of science, with the background of history in which that story is set Although most of the chapters centre around individual men of science whose work is of value to-day, the historical background is not only that of isolated biography but the continuous history of human affairs Two chapters, on post-war developments and the pursuit of science for its own sake, have been added for this second edition. *Second Edition* 20*s*

A Text-book of Electricity and Magnetism

G R. NOAKES, M A, F Inst P

This is the new, Third Edition of a book which will meet the need of those taking Intermediate degree courses and the Advanced and Scholarship Examinations of the General Certificate of Education All the usual topics required at this stage are dealt with, and where necessary calculus is used Among the special topics discussed are the conduction of electricity through gases, atomic physics and modern views on ferro- and terrestrial magnetism *Third Edition* 14*s*

Advanced Level Examples in Physics

R V JOHNS, M A, B Sc

Lecturer in Physics and Mathematics, City of Liverpool College of Technology

W. F. WARE, B Sc, A.Inst P

Senior Physics Master, Cathays High School for Boys, Cardiff

This book of numerical examples is designed to supplement the theoretical and laboratory work of students preparing for examinations in Physics at the Advanced level of the General Certificate of Education and for Intermediate Degree examinations Some 1,000 examples have been arranged by topics and carefully graded in difficulty Contents are arranged under the headings Mechanics and Properties of Matter, Heat, Light, Sound, and Magnetism and Electricity 16*s*

Comprehensive Inorganic Chemistry

Edited by M CANNON SNEED, J LEWIS MAYNARD and ROBERT C BRASTED

Volume III—The Halogens, by ROBERT C BRASTED

Comprehensive Inorganic Chemistry is an eleven-volume reference work on the chemical elements and their inorganic compounds In this Third Volume the significant advances of recent years are fully reflected in a broad treatment of halogen chemistry Both basic principles and their applications are exhaustively covered, as well as the new processes, methods of production, and the chemistry of compounds which have lately become so important 35*s*.

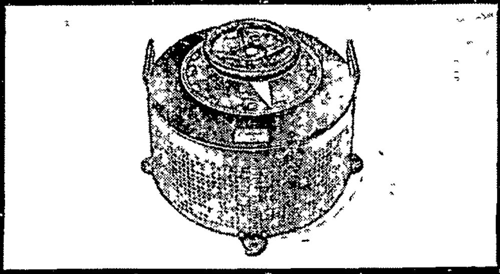
VARIACS for S-M-O-O-T-H Voltage Control



The "VARIAC"† is the original, continuously adjustable auto-transformer . . . the ideal control for varying the a-c voltage applied to any electrical, electronic, radar or communications equipment.

Voltages from Zero to 17% above line are obtained by a 320-degree rotation of the shaft, which is equipped with a direct-reading dial, calibrated accurately.

"VARIAC" offers many real advantages over any other type of a-c control: compared with the losses of resistive controls they save their initial cost within about one year. They are available in various sizes from 170 VA up to 25 Kilowatts, 3-gang assemblies are also available for 3-phase working. Prices vary from £7.10.0. upwards.

The Nucleic Acids

CHEMISTRY AND BIOLOGY

Edited by **ERWIN CHARGAFF and J. N. DAVIDSON**

This new and modern treatise, organized systematically, will appeal equally to advanced students and investigators. Every effort has been exerted to include existing data in lucid and concise fashion, and to appraise objectively current trends of research Both volumes contain numerous working directions on preparatory and analytical methods.

Volume I, February 1955

692 *pp*, *illus*, 120*s*.

Colloidal

Mo S_2

The name of ACHESON COLLOIDS LIMITED has been associated, for over 50 years, with the manufacture of colloidal dispersions of graphite and other solids Now to their well-known range of 'dag' dispersions, they add colloidal dispersions of molybdenum disulphide. This outstanding new lubricant is being applied with great advantage to :—

Die forging, drawing, extrusion and cutting of metals,
Lubrication in operations involving high pressure and temperature,
Dry lubrication.

If you are interested in these new developments or in the various applications of our range of products our technical staff will gladly discuss them with you

GRIFFIN & TATLOCK

(*A Division of Griffin & George Ltd*)

giving a resolution within 3 A., using currents as low as 10^{-19} amp. It was suggested that the technique has application, for example, to the investigations of fragmentization processes on metal catalysts.

The third session dealt with the investigation of surface phenomena using the field-emission microscope. Further discussion on adsorption and on the mobility of oxygen on tungsten was given in a paper by R. Gomer and J. K. Hulm (Chicago). Oxygen in the monolayer is not mobile below 450° K., and becomes a two-dimensional gas only at temperatures exceeding 700° K. The layers formed at low temperatures do not form at room temperatures. No changes in the chemisorbed layer are produced by heating in high vacuum to temperatures up to 600° K. Studies of the reaction of oxygen were described by E. A. Gulbransen (Westinghouse). Transmission optical methods have application in studies of chemical and physical reactions on metals as well as of the study of fine details of the substructure of the metal itself. A. T. Gwathmey (Virginia) described work on the nature of a metal surface as determined with the aid of large single crystals in the form of a surface exposing all possible faces, and also in a form of a flat surface exposing only specific faces. Study of surface processes such as etching, wetting, electrodeposition, and friction and wear, confirm the dependence of surface properties on crystal face. Oxidation of a copper crystal was shown on a coloured ciné film. P. W. Kruse (Notre Dame and Farnsworth) and E. A. Coomes (Notre Dame) described a study of the kinetics of strontium oxide on molybdenum. The pattern obtained on a heat-treated molybdenum point corresponds to that proposed for clean tungsten by Becker and by Muller.

The conference closed with a series of papers from Linfield College, Oregon. The stability of electron emission from metals in the combined presence of high surface electric field and elevated cathode temperature (*T–F* emission) was discussed by W. P. Dyke, and experiments using temperatures of 2,000° K. for tungsten were described, evaporation and surface migration being used to obtain a smooth clean surface. Stability of the field-emitter was discussed by E. E. Martin; instability can be due to the action of helium atoms, which diffuse through the tube envelope; the effect is removed by using an evacuated buffer space. Emission of current densities $\sim 5 \times 10^6$ amp./cm.^{2} from a single lattice step of clean tungsten was observed by J. K. Trolan using a pulse technique. W. W. Dolan described the dissolution of individual lattice planes made visible by the technique of high surface electric field and high cathode temperature, thus permitting a new approach to the study of transport mechanism at the emitter surface.

F. LLEWELLYN JONES

CHROMATOGRAPHY

An anonymous American Fulbright scholar, in a generous appreciation of his visit to the biochemistry department of an English university, wrote as follows: "It is certainly not entirely a misfortune that English laboratories to-day are much less lavishly equipped than those in the United States. For example, one of the most important advances of recent years has been the use of the method known as paper chromatography. To operate this method, one needs only a strip of moistened filter paper, suitably mounted in a box, and a few substances that can be bought from any dealer in pure chemicals. Yet by this technique complicated mixtures of numerous different amino acids or other substances can be sharply separated into their components, and then identified, even when separation by the methods of classical chemistry was impossibly tedious and ineffective. The method has come rapidly into use all over the world, for countless different kinds of problems. It is almost certainly no accident that this method was developed in England in the midst of all its shortages, toward the end of the war, rather than in the far more opulent United States" (Report on Fulbright Program, 1951–52, p. 23). However this may be (and one would not like to have the argument accepted too readily by those responsible for financing the universities), it is fair to say that British workers have been pioneers in the modern development of chromatography in its various aspects, and it is appropriate that the *British Medical Bulletin*, which is sponsored by the British Council, should publish a survey of this subject (Vol. 10, No. 3, pp. 161–252. London: British Council. 15*s* net).

Dr. C. E. Dent acted as scientific editor, and there are articles by nineteen authors who are all experts in their respective fields. Dr. A. J. P. Martin, who, jointly with Dr. R. L. M. Synge, received the Nobel Prize in 1952, was chairman of the planning committee and he writes the foreword. He outlines the immensely wide scope of chromatography, which has become an indispensable tool in almost all fields of biochemistry, and he ends by trailing his coat with the words, "I hope that chromatography may ultimately play some part in the process, which I believe to be wholly desirable, of the conversion of medicine from an art to a science". This is followed by a section on general principles of chromatography by Dr. R. J. P. Williams. For the benefit of newcomers to the subject, this might perhaps have been made a little more 'general' even at the risk of some overlapping with other articles. A large proportion of the limited space of this introductory section is devoted to gradient analysis, which is a rather specialized type of technique. There follows a brilliant chapter by Drs. A. T. James and A. J. P. Martin on gas–liquid chromatography, a technique which can be used to separate and estimate the members of a homologous series of substances such as hydrocarbons, alcohols, fatty acids, etc. This technique has a very wide scope and it is likely that in time it will completely replace analytical distillation. Some indication is given of the devices of these authors for estimating and automatically recording the substances after separation, devices which are elegant and ingenious in the extreme.

There are many references to adsorption chromatography and to ion exchange resins; but the main part of the volume is devoted to paper chromatography, starting with Dr. R. Consden's introduction, which is full of useful practical tips based on his wide experience as a pioneer in this technique. There seems to be a slip in the statement (p. 182) "if the R_F is too high in one solvent, a lower [sic] homologue may prove satisfactory". Other sections include the chromatography of inorganic substances, organic acids, proteins, peptides, amino-acids (dealt with in three sections), porphyrins, sterols, antibiotics and vitamins, carbohydrates and phosphoric esters. This last section, by Dr. F. A. Isherwood, is outstandingly good, as is Dr. R. Markham's review of nucleotide, work, with a mass of useful information compressed into a small space Dr J Gross deals with the thyroid hormones and includes an account of the recent discoveries which he and Mrs R Pitt-Rivers have made on the various iodine compounds in the thyroid gland and in the blood Much of this important work would have been impossible without the use of paper chromatography in combination with tracer technique using radioactive iodine, which permitted analyses to be made on an ultra-micro scale This article, and the one by Drs C E Dent and J M Walshe on amino-acid metabolism, are of direct medical appeal

Some of the articles contain a good deal of hitherto unpublished work, and each includes a bibliography which greatly adds to the value of the publication Incidentally, references to *Nature*, which is being regularly used as a forum for the recording and exchange of new chromatographic procedures, appear frequently in these bibliographies It seems a pity that all the illustrations in a volume entitled "Chromatography" should be produced in black-and-white Some private journals, notably *Endeavour*, have shown what æsthetically pleasing results can be achieved by the use of colour in illustrating chromatographic techniques, even if, from a purely scientific point of view, the gain does not justify the large extra cost. No worker who is interested in chromatography, whether beginner or expert, can fail to benefit from reading this admirable publication It is likely to be used on the laboratory bench as well as in the library, and it deserves to be protected from accidental 'paper chromatography' by being given a permanent binding D C HARRISON

THE EXPANDING UNIVERSE.

A SLIGHTLY modified version of a talk given by G J Whitrow in February 1953 in the B.B C Third Programme has now been published as a paper under the title of "The Orthodox Theory of the Expanding Universe" in the October issue of *Occasional Notes of the Royal Astronomical Society* (17, 3, 1954) A fairly large portion of the talk is concerned with a work by Paul Couderc, a French astronomer, which appeared in a French edition in 1950 and was translated into English by J B Sidgwick under the title "The Expansion of the Universe" (1952) The first part of the talk gives a very useful résumé of the developments in our knowledge of the universe during the past thirty years, in which period it was accepted that the universe extends far beyond the limits of our galaxy, and also that the red shift strongly suggested the recession of the extra-galactic nebulæ, all of which were moving away from one another The talk then considers other interpretations that have been given to the displacement towards the red end of the spectrum, dealing in particular with various matters connected with Couderc's book.

This book is recognized as a very useful contribution to cosmology in so far as it provides us with a simplified account of the mathematical theory of the expanding universe, but in recent years some British cosmologists have advocated a new theory based on the hypothesis of the continuous creation of matter.- Differences of view arise regarding the form in which this new matter emerges C. Pascual Jordan advocates the formation of super-giant stars, but other cosmologists who challenge this view have put forward the conception of new matter appearing in the form of hydrogen molecules or even neutrons, and the density of the universe remains constant, the decrease in density which would result from the recession of the galaxies being exactly balanced by the continuous creation of matter As might be expected, these theories have been subjected to severe criticisms, nevertheless, they are able to claim one strong argument in their favour—that they allow more time for stellar evolution than the older orthodox view which led to a conception of the earth being older than the galaxies This argument is no longer valid since Baade's announcement about the wrong 'calibration' of the distances of the Cepheid variables (the investigations of Thackeray and Wesselink on the distance of the Magellanic Clouds have corroborated Baade's conclusions), now it seems that it must have been about four thousand million years ago since the universe started expanding, and in addition, the distances of the extra-galactic nebulæ must now be taken as twice those previously estimated.

Whitrow concludes with an expression of disagreement with Couderc's acceptance of the two fundamental hypotheses at the basis of the 'orthodox' theory of the expanding universe, these are that the red shifts are due to the Doppler effect associated with recessional motion, and also that the laws of Einstein's general theory of relativity, either with or without the idea of cosmical repulsion, govern the structure of the universe as a whole He thinks that neither of these is on such firm foundations as Couderc believes, but in spite of this disagreement he speaks highly of the latter's book which, on p. 213, seems to express a little doubt on the inadequacy of some of his own arguments "Everything possible has been extracted from existing observations, until the appearance of new data we would be wise to give our imaginations a rest" To this remark Whitrow makes the very relevant reply " . . if such advice had been accepted by Copernicus he would never have ventured beyond the Ptolemaic theory".

RECENT MOLLUSCA OF CANADA

THE great extent of Canada has resulted, and will probably long result, in its molluscan fauna being studied in four separate areas the Eastern Provinces, British Columbia, the Arctic region based on Hudson Bay, and the Prairie Provinces. In the first three, marine, freshwater and land forms are involved, but in the fourth only freshwater and land. Partly for this reason and also because many of the species were first described from other countries, the literature involved is extensive and scattered.

A very useful service in rendering this literature and its results available for the whole of Canada has been performed by the publication of Bulletin No. 129 of the National Museum of Canada, entitled "Catalogue of the Recent Mollusca of Canada", by Dr. Aurèle La Rocque (Biological Series No. 44. Pp. ix+406 Ottawa · Queen's Printer, 1953, 2 50 dollars). It fills a very obvious gap, for it provides a list of the accepted species and forms that have so far been recorded, numbering about 2,250 The author has wisely included forms that have actually only been described from adjacent seas and land areas, where it may reasonably be inferred that more extensive collecting will lead to their being found within the strict territorial limits. Under each form are given the original reference and, where known, the type locality, references to papers containing further data, and the known range. A complete synonymy is not given for any species; but it can be obtained from the references. In some instances one or, more rarely, two synonyms in use in previous Canadian records are provided. Future collecting will no doubt add to the list considerably, but it will also be liable to reduce it when the method adopted by Hubendick for *Lymnaea peregra* is applied to some of the freshwater forms. The number of species of some genera, for example, Odostomia from the Pacific coast, that are only known from the one record from the type locality, implies that more extensive collecting will show some of them to be members of highly variable rather than separate species.

Two minor points suggest that a more careful check of dates might have been made: for example, on p. 2, the author states that it is unnecessary to give references to the original founding of genera because they are given by Neave (1935), but, as correctly cited in the bibliography, the earliest date of Neave is 1939; the date of Mozley's paper on *Stagnicola traskii castorensis* is given as 1930 in the text, but 1931 in the bibliography. However, on the whole there is nothing but praise for this well-printed and well-presented catalogue, which could only have been prepared so satisfactorily by one like Dr. La Rocque, who combines critical enthusiasm with a long personal acquaintance with his subject.

INFLUENCE OF MONOLAYERS ON THE NATURAL RATE OF EVAPORATION OF WATER

By W. W. MANSFIELD

Division of Industrial Chemistry, Commonwealth Scientific and Industrial Research Organization, Melbourne

FOR many years it has been known that the presence on water surfaces of monolayers of a number of long-chain compounds or of layers of appropriate oil mixtures may restrict the evaporation of water[1,2]. Apart from this property, a film suitable for reducing natural evaporation from water storages must resist the actions of wind and dust, must be reasonably permanent and capable of ready and economic application, should not restrict markedly the access of air and sunlight to the water, and must not be toxic. In this communication there are summarized a number of results which indicate that monolayers of cetyl alcohol satisfy these requirements.

Action of wind and dust. In this laboratory it has been found that rigid films, such as monolayers of long-chain fatty acids or oil layers containing appropriate additives, are damaged by both wind and dust. As the rigidity of the film also hinders repair, the ability to retard evaporation is lost rapidly.

With more fluid oil films, the inevitable reversion to the system of lenses in equilibrium with a monolayer is hastened by wind and dust. A monolayer of this type of film does not offer great resistance to the transfer of water vapour, and the restriction provided by the lenses is reduced markedly by settled dust. Accordingly, under natural conditions the efficiency of such systems decays rapidly.

Provided excess crystals of the solid from which it is derived are available, the efficiency of a liquid monolayer, such as that formed by a long-chain alcohol, is unimpaired by the action of wind. It has been observed also that the performance of this system is not diminished by bombardment with dust; in fact, the resistance to transfer of vapour is increased temporarily. Only materials such as powdered talc and carbon, capable of remaining on the surface for some time, cause a decline in efficiency. The occurrence of considerable proportions of these substances in natural dust is not common.

Performance of monolayers. The resistances offered to the transfer of water vapour by a number of monolayers, formed on still surfaces by spreading from the solid, have been determined. The apparatus used resembled that described by Langmuir and Schaefer[3]. It has been found that straight-chain alcohols generate monolayers providing greater retardation than those formed from alcohols containing branched chains or ring skeletons within the molecule. For the straight-chain alcohols, most efficient restriction is obtained with monolayers of cetyl or stearyl alcohol. At room temperature, these two films exhibit very similar behaviour, offering a resistance to vapour transfer about 1,600 times greater than that of a clean water surface, for which an accommodation coefficient of 0.036[4,5] has been assumed. The accommodation coefficient of monolayers does increase with temperature, however; for cetyl alcohol the rise is from 2.2×10^{-5} at 20° C. to 7.9×10^{-5} at 50° C.

Out of doors, the laminar layer of air above a water surface provides a resistance which is normally about eight hundred times that of the water surface alone. The presence of a monolayer of cetyl alcohol results in a total resistance which is three times greater; accordingly, the monolayer should reduce natural evaporation by about 70 per cent. Any reduction in evaporation, however, promotes an increased surface temperature. The consequent compensation, the extent of which varies with the wind velocity, the depth of water and the radiation received by the water, is not excessive for average conditions. A previous conclusion[6] that this compensating effect prevents significant control of evaporation is quite incorrect; it was influenced by poor results obtained with imperfectly developed monolayers spread on small and shallow samples of water. The construction of heat balances, somewhat after the manner of Ferguson[7], predicts a mean reduction of about 45 per cent for normal summer conditions in inland southern Australia.

Diminution of evaporation to this extent admittedly is not spectacular, but may be achieved without any significant decrease in the rate of access of oxygen or other gases to the water, and also without hindering the penetration of light. Severe restriction of evaporation by a film alone should be avoided, because the influx of oxygen may be retarded sufficiently to promote stagnation. Similarly, the combined use of floating reflecting surfaces and a monolayer[8] inhibits evaporation to a much larger extent than does a monolayer alone, but the entry of sunlight is restricted also.

Attainment of optimum performance. The estimates presented are based on results obtained for a monolayer in equilibrium with the solid, that is, at a surface pressure of 40 dyne cm.$^{-1}$ The true surface area of a natural stretch of water varies continuously, engendering a variable surface pressure of a monolayer spread on it unless means of replenishment and storage are available. Compression of a liquid monolayer forces rapid crystallization of excess molecules, so that the existence of surface pressures greater than 40 dyne cm^{-1} may be disregarded. On the other hand, expansion of a monolayer produces marked degeneration of surface pressure; an expansion of 10 per cent is sufficient to lower the pressure from 40 dyne cm^{-1} to practically zero. It follows that the mean pressure on a disturbed surface will always be less than 40 dyne cm.$^{-1}$ unless an adequate method of replenishment is provided. As the restriction offered to evaporation decreases rapidly with decrease of surface pressure[2,3], such provision is necessary. The presence of excess solid material, stored in suitably designed rafts when necessary, constitutes a convenient reservoir.

The efficiency of these reserves is proportional to the total perimeter of the solid in contact with the water surface and the rate of liberation of molecules from unit perimeter of the solid, and is inversely proportional to the area of the stretch of water. Accordingly, the measurement of rates of spreading and the determination, from the data of Sverdrup and Munk[6], of the maximum rate of disturbance of natural water surfaces has permitted estimation of the amounts of cetyl alcohol for maximum performance.

The estimates indicate that for pure crystalline cetyl alcohol a perimeter/area ratio of 10^{-3} cm^{-1} should be ample for most applications, greater doses being required only in areas of abnormally high mean wind velocities or when small dams are treated. For particles about 3 mm. in diameter and 0·5 mm. thick, a concentration of 3 cwt. mile^{-2} is sufficient.

Samples of cetyl alcohol possessing spreading rates very much greater than that of pure crystalline cetyl alcohol may be prepared readily. Enhancement follows from the existence of a high-energy, amorphous surface or from the presence of homologous alcohols of lower molecular weight. In contact with water, however, the rate of spreading of such materials decreases. Consequently, for the estimates mentioned above, the minimum rate has been assumed. Similarly, the replenishing ability of the aggregates produced by relaxation of a previously disturbed surface has been ignored.

The achievement of optimum performance requires also that the concentration of deleterious impurities within the cetyl alcohol used is low. Long-chain unsaturated alcohols such as oleyl alcohol must be removed, because monolayers relatively permeable to water vapour are spread rapidly from these compounds. Experiments in this laboratory indicate that a sample of cetyl alcohol is sufficiently pure if the solid is white and the molten material quite colourless, and if the melting point of the preparation lies between 47° and 51° C.

Field-trials. The limited trials conducted to date have provided encouraging results. Between September and December 1953, Mr. W. C. Swinbank, of the Section of Meteorological Physics, Commonwealth Scientific and Industrial Research Organization, continuously obtained restriction of evaporation from a vessel about 18 in. in diameter and 3 ft. deep, using a single pellet of cetyl alcohol to give a perimeter/area ratio of about 1·5 × 10^{-3} cm.$^{-1}$. By comparison with the behaviour of water held in an adjacent and identical vessel, it was estimated that about 6 in. of water was saved during the period. The temperature near the surface of the treated water was always greater than that of the control, the increment varying with conditions from 0·2 to 3 deg. C.

Dusting a surface with cetyl alcohol powder initially engenders marked control of evaporation. With the passage of time, however, agglomeration of the powder occurs and decreased efficiency results. During September 1953, the evaporation from vessels 12 in. in diameter and 18 in. deep was reduced by 75 per cent for the first week, by 45 per cent for the second week, whereas no significant retardation was observed thereafter. In this instance the mean evaporation from the control was 0·8 in. per week.

Subsequent experiments in similar vessels, using pellets of cetyl alcohol of known perimeter, revealed that maximum control of evaporation is not attained in vessels of this size unless the perimeter/area ratio exceeds 5 × 10^{-3} cm^{-1}. When sufficient cetyl alcohol was available, evaporation was reduced by an average of 48 per cent for various periods between October 1953 and January 1954, with a mean evaporation from the control of 1·5 in. per week.

Early in November 1953, the surface of a reservoir at Woomelang, Victoria, and extending over two acres, was treated with pellets of cetyl alcohol supported by rafts constructed from waterproofed wood and copper gauze. The nominal perimeter/area ratio of 1·1 × 10^{-5} cm.$^{-1}$ was much smaller than that now considered desirable (7 × 10^{-4} cm.$^{-1}$), but temporarily was undoubtedly higher following the ejection of fragments from the pellets during spreading. Within an hour of seeding, the normal surface pressure of 2 dyne cm.$^{-1}$ had risen to 20 dyne cm.$^{-1}$, which value was observed again five weeks later. Comparison of the levels of this with an immediately adjacent and untreated reservoir indicated a decrease in apparent evaporation during rainless periods of 30 per cent. The advent of rain, however, revealed the intake of the control reservoir to be greater. Accordingly, it cannot be stated that the observed decrease in apparent evaporation followed from the presence of a surface film, as it may have been caused by differing rates of seepage, which appeared to be high and erratic.

In January 1954, a bank of five standard evaporimeters, of diameter 3 ft., was installed by the Section of Meteorological Physics at Aspendale, Victoria. For the remainder of the summer, efficient restriction of evaporation was obtained only over limited periods. Eventually it was found that a rigid film, sufficiently thick to be easily visible, provided the obstacle to success. The film, which is presumed to result from the presence of frogs in the evaporimeters and resembles that formed on water approaching stagnation, retards considerably the rate of spreading of cetyl alcohol. It has been found that efficient control in these circumstances requires periodic displacement of the rigid film with a solution of cetyl alcohol in a volatile solvent, the interval between displacements depending on the concentration of solid cetyl alcohol which is then placed upon the surface. This variant of the usual process will be desirable on many small dams.

Working life of the treatment. It was observed initially by Mr. W. C. Swinbank that retardation of evaporation becomes insignificantly small only after a lapse of about four days following the removal of the solid material from which a film has spread Much of this persistence may be ascribed to the action of micro-reservoirs, formed and utilized continuously by reduction and extension of the true area of the water surface Assuming, however, that cessation of activity follows only from solution in the water of sufficient of the monolayer, it has been estimated that the life of a dosage of 3 cwt mile^{-2} is at least ten years. Should this value prove to be even several-fold too great, the process remains quite economic.

Future work These summarized results are considered sufficiently promising to warrant further and extensive trials. A number of stretches of water, both large and small, throughout Australia will be treated during the coming summer The Director of the East African Meteorological Department has indicated that similar work is contemplated by his Department, and Dr. J H. Schulman, of the University of Cambridge, has expressed an intention to carry out large-scale experiments. Accordingly, a comprehensive evaluation of the method should be available within two years

Progress in this work has been accelerated considerably by the advice, criticism and assistance of Mr. W. C. Swinbank and Dr. C. H. B Priestley, of the Section of Meteorological Physics of the Commonwealth Scientific and Industrial Research Organization. Acknowledgments are due also to Dr. K. L Sutherland, Division of Industrial Chemistry, to Mr R. Penman, Section of Meteorological Physics, of this Organization, and to Mr. L N. Welsh, Mr R. G. Upstill, Mr. J Wise and Mr. R Cook, of the Victorian State Rivers and Water Supply Commission.

SYNTHESIS OF CARBOHYDRATES FROM CARBON DIOXIDE AND HYDROGEN IN A CELL-FREE SYSTEM

By DR. E RACKER

Division of Nutrition and Physiology, Public Health Research Institute of the City of New York

CALVIN and his collaborators were the first to demonstrate[1] that a few seconds after photosynthesizing cells are exposed to carbon-14 dioxide, radioactivity can be found in 3-phosphoglyceric acid. The discovery of sedoheptulose phosphate and ribulose diphosphate in extracts of photosynthesizing cells led to the proposal of a mechanism in which ribulose diphosphate acted as the primary acceptor of carbon dioxide, yielding two moles of 3-phosphoglyceric acid on cleavage[2] Regeneration of the carbon dioxide acceptor was proposed to occur by a cyclic process in which transketolase, transaldolase and some glycolytic enzymes participate. Carboxylation of this acceptor was shown to occur also in cell-free extracts obtained from *Chlorella*[3]. Recently, evidence for the carboxylation of pentose phosphate in cell-free extracts from spinach with ribose-5-phosphate as substrate was obtained independently by Cowperthwaite and Racker (unpublished results), and by Weissbach, Smyrniotis and Horecker[4]

It is the purpose of this communication to present evidence for a cyclic process and to report the net synthesis of carbohydrates from carbon dioxide and reduced diphosphopyridine nucleotide, adenosine triphosphate and catalytic amounts of ribose-5-phosphate in the presence of a fractionated enzyme preparation from spinach Either alcohol, in the presence of alcohol dehydrogenase, or hydrogen, in the presence of diphosphopyridine nucleotide-linked hydrogenase, was used as hydrogen donor for the reduction of the pyridine nucleotide When reduced diphosphopyridine nucleotide was regenerated with hydrogen, the major precursors of the carbon, oxygen and hydrogen of the carbohydrate thus synthesized were carbon dioxide and molecular hydrogen. Adenosine triphosphate supplied the required energy

The Pentose Phosphate Cycle and its Enzymes

Before a net synthesis of carbohydrate in a cell-free system can be explained, a balanced equation representing a series of reactions catalysed by demonstrable enzymes is required (Table 1) All enzymes listed in Table 1 can be readily shown to occur in cell-free extracts However, some of the intermediates of the reactions have not been fully characterized and further purification of the component enzymes is still required The cyclic operation of these reactions is shown in Fig. 1.

Table 1 THE PENTOSE PHOSPHATE CYCLE*

Reaction	Enzyme
(1) 3 pentose-p + 3 ATP → 3 "RDP" + 3 ADP	Phosphopentokinase
(2) 3 "RDP" + 3 CO_2 + 3 H_2O → 6 PGA	"RDP" carboxylase
(3) 6 PGA + 6 ATP → 6 diPGA + 6 ADP	PGA-kinase
(4) 6 diPGA + 6 DPNH + 6 H^+ → 6 triose-p + 6 DPN + 6 P_i	Triose-p dehydrogenase
(5) 4 triose-p → 2 HDP	Aldolase, triose-p isomerase
(6) 2 HDP + 2 H_2O → 2 HMP + 2 P_i	HDP-ase
(7) 1 HMP + 1 triose-p → 1 pentose-p + 1 tetrose-p	Transketolase
(8) 1 HMP + 1 tetrose-p → 1 heptulose-p + 1 triose-p	Transaldolase
(9) 1 heptulose-p + 1 triose-p → 2 pentose-p	Transketolase

Sum (1–9) $3CO_2 + 9ATP + 5H_2O + 6DPNH + 6H^+ \rightarrow 1 \text{ triose-p} + 9ADP + 6DPN + 8P_i$

(10) $9H_2O + 9DPN \rightarrow 9DPNH + 9H^+ + 9O$

(11) $3DPNH + 9ADP + 9P_i + 3H^+ + 3O \rightarrow 3DPN + 9ATP + 12H_2O$

Sum (1–11) $3CO_2 + 2H_2O + P_i \rightarrow 1 \text{ triose-p} + 6O$

* The following abbreviations, among others, have been used ATP and ADP for adenosine triphosphate and adenosine diphosphate, DPN and DPNH for oxidized and reduced diphosphopyridine nucleotide, P_i for inorganic phosphate and -p for organically bound phosphate, HDP for fructose-1,6-diphosphate, and HMP for either glucose-6-phosphate or fructose-6-phosphate

Phosphopentokinase (Reaction 1) The enzyme which catalyses the formation of ribulose diphosphate[5] in the presence of ribose-5-phosphate and adenosine triphosphate will be referred to as phosphopentokinase[6]. It should be pointed out that the substrate for this kinase has not yet been identified Since it has been shown (de la Haba, G L, and Srere, P. A, unpublished results) that a preparation of highly purified phosphopentose isomerase from alfalfa leaves[7] transforms ribose-5-phosphate into a mixture of ketosugar phosphates of which only a small portion is ribulose-5-phosphate (susceptible to the action of transketolase), the possibility of a substrate other than ribulose-5-phosphate must be considered The product of the kinase reaction has been shown to be a ketosugar diphosphate[6] The compound is here referred to as ketopentose diphosphate or "RDP", since the available evidence does not seem to rule out configurations other than the 2-ketoribose (for example, a 3-ketoribose)

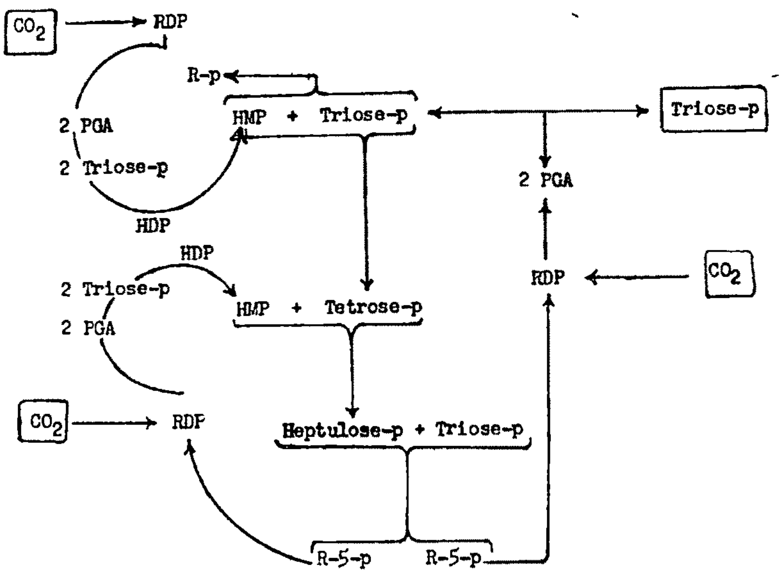

Fig 1 The pentose phosphate cycle

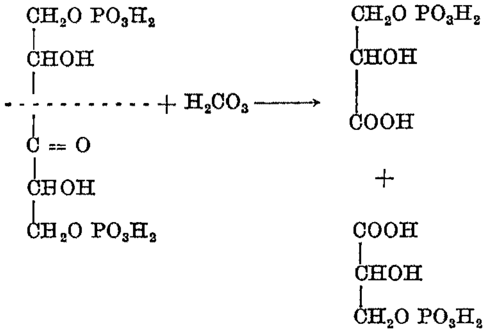
"*RDP*" *carboxylase* (Reaction 2). This enzyme catalyses the cleavage of ketopentose diphosphate to two moles of 3-phosphoglyceric acid in the presence of bicarbonate (Jacobi, W., personal communication) Calvin and his collaborators proposed the formation of an ene-diol of ribulose diphosphate which adds carbon dioxide to form an unstable α-hydroxy-β keto acid The latter would then be hydrolysed to form two moles of 3-phosphoglyceric acid

An alternative mechanism might be proposed involving the formation of a 3-ketopentose diphosphate which is cleaved by bicarbonate to two moles of 3-phosphoglyceric acid as follows



$$\begin{array}{l} CH_2O\ PO_3H_2 \\ | \\ CHOH \\ | \\ \text{- - - - - - - -} \\ | \\ C=O \\ | \\ CHOH \\ | \\ CH_2O\ PO_3H_2 \end{array} + H_2CO_3 \longrightarrow \begin{array}{l} CH_2O\ PO_3H_2 \\ | \\ CHOH \\ | \\ COOH \\ \quad + \\ COOH \\ | \\ CHOH \\ | \\ CH_2O\ PO_3H_2 \end{array}$$

Glycolytic enzymes (Reactions 3–6). The phosphorylation of 3-phosphoglyceric acid to diphosphoglyceric acid is catalysed by phosphoglyceric kinase, the reduction of diphosphoglyceric acid to triose phosphate by triose phosphate dehydrogenase in the presence of reduced pyridine nucleotides, and the condensation of triose phosphates to fructose-1,6-diphosphate by aldolase, these enzymes have been demonstrated in extracts from various plants

The formation of fructose-6-phosphate from fructose-1,6-diphosphate is known to occur in liver[8] and is now shown to be catalysed by a specific enzyme which has been purified over a hundredfold from spinach extracts The enzyme activity is dependent on magnesium ions Further stimulation (about fourfold) is obtained by addition of ferrous salts and ethylenediamine tetraacetate No hydrolysis of several monophosphate esters of hexoses and pentoses could be detected in the presence of the purified enzyme

Enzymes of the glucose-6-phosphate shunt (Reactions 7–9). A cycle of glucose-6-phosphate oxidation in which the first three carbons of glucose are oxidized to carbon dioxide, while carbons 3, 4 and 5 form a triose phosphate, was discussed in a recent review[9] It can be postulated that a condensation of two triose phosphates to fructose-1-6-diphosphate, which is hydrolysed to fructose-6-phosphate, followed by another turn of the cycle, can lead to the complete oxidation of glucose to carbon dioxide and water Reactions 7–9 in Table 1 represent part of this glucose-6-phosphate cycle, written in reverse order and linked to a reductive step catalysed by triose phosphate dehydrogenase instead of to the oxidative step catalysed by glucose-6-phosphate dehydrogenase Carboxylation of "RDP", instead of the decarboxylation of 6-phosphogluconic acid, takes place in the plant cycle.

New Assay Methods and Purification of the Enzymes of the Pentose Phosphate Cycle

The elucidation and fractionation of the system described above have been greatly facilitated by the use of rapid assay systems which were developed for the individual reactions.

Phosphopentokinase This enzyme can be assayed by a manometric method similar to that used for hexokinase determinations[10]. However, it is essential for the activity of this enzyme to add glutathione (or other SH compounds) The enzyme is inhibited by N-ethyl maleimide

A more convenient and accurate assay for adenosine triphosphate-linked kinases has been used preferentially in our laboratory. It is based on the colorimetric determination of acyl phosphates by the hydroxylamine reaction of Lipmann and Tuttle[11] With a purified preparation of acetokinase[12], catalytic amounts of adenosine triphosphate and excess of

Table 2 ASSAY OF PHOSPHOPENTOKINASE WITH THE ACETO KINASE SYSTEM

	µmoles acetyl phosphate disappeared
Complete test system (cf text)	
containing 0 1 ml of spinach fraction	1 8
containing 0 2 ml of spinach fraction	3 5
containing 0 3 ml of spinach fraction	5 0

containing 0 2 ml of spinach fraction but no ribose-5-phosphate	0 2
Test system without spinach fraction	0 2

acetyl phosphate, the latter compound disappears only in the presence of an acceptor system for the terminal phosphorus of adenosine triphosphate The test system contained in a final volume of 1 ml, 50 µmoles of tris (hydroxy) aminomethane buffer, pH 7 4, 5 µmoles of magnesium chloride, 1 µmole of adenosine triphosphate, 5 µmoles of glutathione, 8 µmoles of lithium acetyl phosphate, 20 units of acetokinase, 7 µmoles of ribose-5-phosphate and the enzyme solution to be tested After 10 min. at 25° C, determination of acetyl phosphate was carried out on the entire sample A typical assay for phosphopentokinase is shown in Table 2 The enzyme has been purified about twenty-five fold by fractionation with acetone (33–50 per cent), ammonium sulphate (20–50 per cent) and isoelectric fractionation.

"RDP" carboxylase. The formation of phosphoglyceric acid was measured spectrophotometrically. In the presence of excess phosphopentokinase, phosphopentose isomerase, adenosine triphosphate, magnesium ions, phosphoglyceric kinase and glyceraldehyde-3-phosphate dehydrogenase, the oxidation of reduced diphosphopyridine nucleotide is dependent on the "RDP" carboxylase The measurements were carried out in a Beckman *DU* spectrophotometer as 340 mµ The enzyme has been purified eighteen-fold with ammonium sulphate (20–50 per cent), alcohol (14–19 per cent) and isoelectric fractionation

Transketolase, transaldolase and hexose diphosphatase. Transketolase was measured by triose phosphate formation in the presence of an equilibrium mixture of ribose-5-phosphate and ribulose-5-phosphate ('isomerase product'). The details of the test and crystallization of the enzyme from yeast have been described[13]

Transaldolase was measured with glucose-6-phosphate dehydrogenase 'Isomerase product' and transketolase were used to generate heptulose phosphate and triose phosphate The details of the test and the purification of the enzyme from *Torula* yeast will be described elsewhere[14]

Hexose diphosphatase was measured also with glucose-6-phosphate dehydrogenase in the presence of hexose phosphate isomerase Alternatively, the rate of liberation of inorganic phosphate from fructose-1,6-diphosphate was determined Separation of the enzyme from "RDP" carboxylase and phosphopentokinase has been achieved by ammonium sulphate fractionation and the use of calcium phosphate gel

Overall Reaction and the Synthesis of Hexose Phosphate

The sum of reactions 1–9 reveals that triose phosphate should be synthesized from carbon dioxide and water if adenosine triphosphate and reduced diphosphopyridine nucleotide are provided in the presence of the appropriate multi-enzyme system Ribose-5-phosphate or any precursor system for ribose-5-phosphate or ribulose-5-phosphate should serve in only a catalytic fashion.

The regeneration of adenosine triphosphate from the diphosphate by coupled phosphorylation and the reduction of diphosphopyridine nucleotide by photolytic cleavage of water[15] can provide the energy and the reducing agent (reactions 10 and 11) required for the total synthesis of carbohydrate from carbon dioxide and water. These two key reactions of photosynthesis have been demonstrated in cell-free systems[15,16]

Large amounts of adenosine triphosphate were added in the present experiments in order to avoid the use of grana which catalyse oxidative phosphorylation Reduced diphosphopyridine nucleotide was generated with hydrogen and a diphosphopyridine nucleotide-linked hydrogenase (kindly supplied by Mr L Packer and Dr. W Vishniac) or with alcohol and alcohol dehydrogenase

As shown in Table 3, synthesis of hexose phosphate takes place in the purified system. Stimulation by bicarbonate was demonstrated, as well as dependency on catalytic amounts of pentose phosphate and a reducing system Transketolase, transaldolase and phosphopentokinase are present in non-limiting quantities in the "RDP" carboxylase preparations from spinach, and a pronounced stimulation of hexose monophosphate formation by addition of these enzymes has therefore not as yet been achieved.

Table 3 SYNTHESIS OF HEXOSE MONOPHOSPHATE FROM CARBON DIOXIDE, REDUCED DIPHOSPHOPYRIDINE NUCLEOTIDE AND ADENOSINE TRIPHOSPHATE

Ribose-5-phosphate omitted	0 3
Hydrogen and hydrogenase omitted	0 4

* The complete system contained the following components in a final volume of 1 ml tris (hydroxy) aminomethane buffer (pH 7 6), 50 µmoles, potassium bicarbonate, 50 µmoles, ribose-5-phosphate, 0 25 µmole, magnesium chloride, 2 5 µmoles, diphosphopyridine nucleotide, 0 5 µmole, glyceraldehyde-3-phosphate dehydrogenase, 1 mgm, phosphoglyceric kinase, 65 µgm, aldolase, 280 µgm, spinach fraction (3 5 mgm) containing phosphopentose isomerase, kinase, carboxylase, transketolase, transaldolase and hexose diphosphatase, glutathione, 5 µmoles, adenosine triphosphate, 40 µmoles, and 1 5 mgm of a hydrogenase preparation The mixture was incubated at 25° under hydrogen for 60 min and then assayed for fructose-6-phosphate

The results here reported therefore demonstrate the operation in cell-free spinach fractions of a cyclic mechanism leading to the net synthesis of carbohydrate from carbon dioxide and hydrogen in aqueous solutions.

Use of the Nitric Oxide/Oxygen Continuum in the Estimation of the Relative Concentrations of Oxygen Atoms in Flame Gases

Gaydon[1,2] has observed that when nitric oxide is added to flames which are likely to contain free atoms of oxygen, a greenish continuum is observed in emission, which is ascribed to a radiative combination

$$NO + O \rightarrow NO_2 + h\nu$$

This identification is highly probable, and is strongly supported by quantitative measurements which we have made of the intensity of the continuum Mixtures of hydrogen and air of known composition have been burned, after mixing, in a Mèker type of burner, to give a flame about 2 cm. in diameter with cones of primary combustion only a few millimetres in height. These flames were surrounded by similar ones, but with separate supplies, giving an overall diameter of about 4 cm, the sheath thus preventing the formation of a cool boundary to the inner flame, and protecting it from the effects of indrawn air.

Attention was focused mainly on the interconal gases a few centimetres above the primary cones, since it is there that fair thermal equilibrium is to be expected The temperature of the inner column was measured by the method of reversal of the sodium D line[3], the metal being added as traces of fine spray of sodium chloride solution to the inner air supply. The composition of the interconal gases at this temperature was then calculated from the known composition of the unburned gases and the relevant data on equilibrium constants given by Lewis and von Elbe[4] In particular, the concentration of free oxygen atoms was obtained, for a series of flames ranging from near stoichiometry to about twice the stoichiometric proportion of hydrogen Temperatures ranged from 2,050° to 2,290° K.

A small amount of nitric oxide was then fed into the supply to the inner flame The reaction zone showed the green continuum very strongly, and this persisted, more weakly, into the interconal gases Its intensity, the spectral variation of which remained constant, was measured by a photo-multiplier and amplifier system mounted in place of the plate-holder on a Hilger E 3 medium quartz spectrograph, and was found to be proportional to the amount of nitric oxide added. The correlation of the measured intensity of the continuum with the calculated oxygen atom concentrations for a series of flames, when 0.4 per cent of nitric oxide was added to the inner flame supply, is shown in Fig. 1.

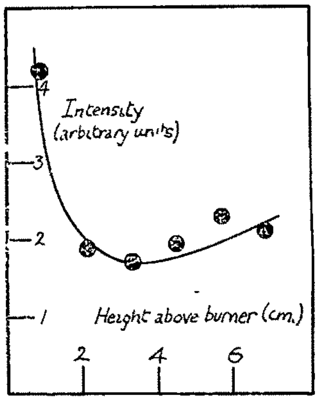

Fig 2 Variation of intensity of nitric oxide continuum with height above burner

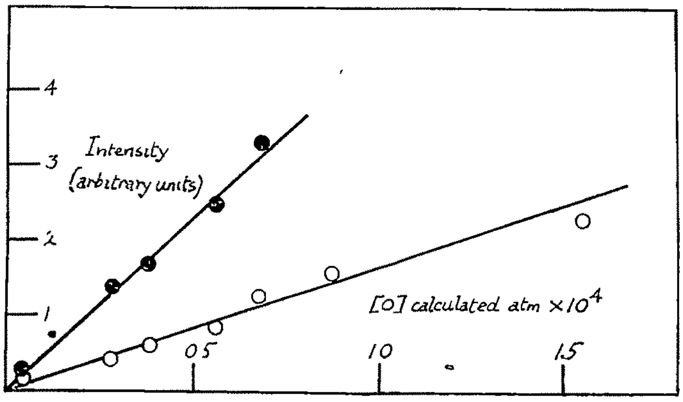

Fig 1 Intensity of nitric oxide continuum against calculated equilibrium [O] for various flames of hydrogen, oxygen and nitrogen ● = 0.8 cm above burner, ○ = 3.2 cm above burner

The upper line was obtained just above the primary cones (0.8 cm above the burner), and the lower line well into the interconal gases (3.2 cm. above the burner). Both show a quite good linear relation with the calculated oxygen atoms. This variation in intensity at different levels in the flame is shown in a particular case in Fig 2, indicating a very rapid decrease in the first centimetre or so above the primary cones, followed by a gradual rise. The intensity of the sodium D lines remained sensibly constant over the total range of height, indicating reasonable constancy of temperature of the bulk of the gases.

It is suggested that there is an excess of free atoms of oxygen over the equilibrium value immediately above the cones, which rapidly approaches equilibrium The time taken for the gas to travel through 1 cm is of the order of 1 m sec The further slow rise is attributed to the effects of indrawn air causing secondary combustion.

It is interesting to note from Fig. 1 that even where the excess occurs it is proportional to the equilibrium amount, that is, it is still governed by the concentrations of the major constituents of the burned gases, which are at or near equilibrium throughout at the reversal temperature These results, as well as confirming the views of Gaydon, show that in these flames, where dissociation of nitric oxide to nitrogen and oxygen is not important, certain quantitative applications are possible

We are grateful to Mr. M T Sampson, of the Butterwick Research Laboratories, Imperial Chemical Industries, Ltd., for the loan of the spectrograph, and one of us (C G J) to the Department of Scientific and Industrial Research for a maintenance allowance

Comparison of the Spectra produced by Shock Waves, Flames and Detonations

IT is now well known that intense shock waves can be produced by bursting diaphragms[1] and that very high temperatures, up to perhaps 20,000° K , can be attained in this way[2] The temperature rise occurs in a very short time, corresponding to only about twenty intermolecular collisions Kantrowitz and colleagues have focused attention on the value of work with shock waves and shown that in some cases they may be sufficiently intense to cause emission of light[3] The highest temperatures are attained with monatomic gases, with polyatomic gases the higher specific heat and especially the dissociation of the gas limits the temperature. Some preliminary studies of the spectra excited in rare gases have been made[4] and recently Greene[5] has observed emission bands of C_2, CH and CN when passing shocks through CF_3I, CH_3I or BrCN

We have commenced to apply the shock-wave technique to the study of combustion problems. Shock waves offer the possibility of simulating the conditions occurring in the reaction zone of a flame, where reactants are brought very quickly to a high temperature With shock waves we have the added possibility of studying the effect of this quick heating in the absence of an oxidizer. Spectroscopic studies of shock waves through fuels may supplement direct flame spectra and studies of flash photolysis Detonations in closed-vessel explosions are, of course, accompanied by a shock wave, and these studies of shock waves alone may help to elucidate the respective shares of shocks and combustion processes in producing luminosity

We have used a shock tube of the normal bursting-diaphragm pattern. The high-pressure chamber is 18 in. long and 2 in. in diameter and is made of $\frac{1}{8}$ in brass It is bolted by flanges to the low-pressure side, which is 46 in long, 2 in. diameter and of $\frac{1}{16}$ in brass The inside is copper-plated, and the low-pressure side is lined with a 'Pyrex' tube cleaned with dilute hydrofluoric acid , this was to reduce impurities, the spectra of which were very troublesome and which appear to be one of the main limitations of the method. The tube was mounted vertically, so that the wave travelled upwards and fragments of diaphragm fell down to the bottom The light was viewed end-on through a thick quartz window, an aluminium mirror being used to reflect the light into a small *F*/4 Hilger Raman spectrograph with interchangeable glass and quartz optics

Hydrogen was used as the driver gas on the high-pressure side, a single diaphragm of 0 003 in cellulose acetate bursting at about 3 atm , and a double diaphragm at 6 atm. The low-pressure side was filled with the experimental gas to a pressure of the order 1 cm mercury For hydrocarbons the initial shock wave may have a Mach number of about 6, and after reflexion a temperature rather greater than 2,000° K is expected

In the work with pure fuel gases, we have found that acetylene gives quite a bright flash, the spectrum showing mainly a strong continuum due to hot carbon particles with some weak C_2 bands and impurity lines (sodium, calcium, copper) superposed. The spectrum from ethyl nitrate showed strong CN violet bands. These are the only two pure fuels which gave a bright enough flash for the spectrum to be recorded. Ethylene gave a weak flash No flash at all was observed with methane or methanol We have therefore studied the flashes produced in mixtures of fuel and argon, this giving more intense hotter shocks Pure argon showed numerous strong lines due to impurities (silver, barium, calcium, copper, iron, magnesium, sodium, silicon, vanadium) with the OH band and some background continuum With a mixture of 90 per cent argon and 10 per cent methane, these impurities were largely suppressed and the spectrum showed very strong C_2 Swan bands on a background continuum extending from the red limit of the plates to at least 3900 A (the limit of the glass optics) The CH band at 4315 A was visible although not strong Acetylene/argon gave a similar spectrum but with rather stronger continuum, which extended to about 2600 A., this continuum was relatively less strong when the pressure of the acetylene/argon mixture was reduced to a few millimetres. Argon/carbon dioxide mixtures failed to give any obvious sign of the carbon monoxide flame bands or blue continuum characteristic of the carbon monoxide flame, the spectrum being dominated by impurities and being similar to that with pure argon, but weaker This supports other work indicating that the carbon monoxide flame radiation is chemiluminescent in origin and not due to thermal radiation from carbon dioxide

Shock waves from bursting diaphragms can also cause ignition in explosive mixtures, and the shock tube has been used for comparing the spectra of shock-ignited and spark-ignited explosions of similar mixtures For spark ignition a small side tube with electrodes connected to an induction coil was added For acetylene/oxygen and ethylene/oxygen mixtures, there was a marked difference between the shock ignition and the spark ignition. With spark ignition the CH bands at 4315 and 3900 A. were relatively much stronger than with shock ignition, whereas the HCO and especially the OH bands were much stronger with shock ignition In all plates with spark ignition, CH 4315 A was the strongest feature on the plate, whereas with shock ignition OH 3064 A was the strongest feature With shock ignition the (2,0) and (1,0) OH bands were also quite strong, but with spark ignition the (1,0) only appeared faintly and (2,0) was not observed The spectrum of the spark-ignited explosions was similar to that of steadily burning flames of similar mixtures, but some impurity lines were observed in the explosions, these being relatively strengthened by raising the pressure The strength of OH and the weakness of CH in the shock-ignited explosions suggest a greater thermal excitation by the shock wave, and perhaps some change in combustion mechanism.

The study of spectra produced by shock waves appears to be a promising way of attacking certain combustion problems, in particular the mode of formation and excitation of radicals such as C_2, CH and OH.

Laboratory Production of the Vegard – Kaplan Bands

THE Vegard – Kaplan $A^3\Sigma - X^1\Sigma$ bands of nitrogen (N_2), some members of which are thought to occur in the spectrum of the upper air, usually require rather special conditions for production in the laboratory[1] Wulf and Melvin[2] and Janin[3] have, however, shown that they are emitted readily from discharges through pure nitrogen in conventional ozonizers As such tubes are somewhat inconvenient to set up and outgas, we have sought to modify them and have found the simple form shown diagrammatically in Fig 1 quite effective. The left-hand section is a piece of 'Pyrex' tube, connected to a pumping train and sodium azide nitrogen generator through a trap cooled in liquid oxygen The central section consists of the same tube flattened to a roughly circular disk 7 cm in diameter, with its plane normal to the paper, and an internal clearance of 2–6 mm. The right-hand section is a 'Pyrex'-quartz graded seal with a flat quartz end. A Tesla discharge is passed through the central section between disk electrodes (A,A') pressed against its outer faces, and the spectrum observed through the quartz window. The discharge is a shower of small sparks, as described by Wulf and Melvin

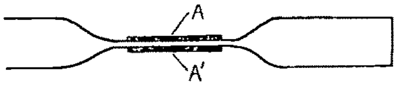

Fig 1 Narrow section of simple discharge tube for excitation of Vegard – Kaplan bands

Like previous workers, we have not found it possible to eliminate completely the γ-bands of NO and the 2537 A. line of mercury. The main ultra-violet Vegard – Kaplan bands were obtained from this source at pressures of 7 cm mercury upward Their intensity was highest at about atmospheric pressure, and showed no appreciable variation between 76 and 160 cm mercury, the latter being the highest pressure used

We have also found that these ultra-violet Vegard – Kaplan bands can be produced (*a*) from Tesla discharges in nitrogen in cylindrical quartz tubes of up to 5 cm. diameter, in this case, although less intense at the highest pressures than with the flat tube, they could be detected at a pressure as low as 1 cm. mercury, (*b*) from discharges through nitrogen in tubes of the form used by Jenkins *et al.*[4], and by others[5], to produce the 'forbidden' green line of oxygen. This has not, however, proved to be a good source and we have not succeeded in finding if, like the green line, they are here emitted preferentially from the periphery of the discharges or an afterglow

None of our plates shows the Vegard – Kaplan bands in the visible region which have been reported from electron-beam discharges through argon and nitrogen[6].

Measurement of the Doppler Width of the λ 5577 Line in the Night Sky

A DETERMINATION of the Doppler width of the λ 5577 oxygen line in the night sky spectrum was attempted by Babcock[1], but his instrumentation permitted only an estimate of the upper limit of this width and hence of the temperature of the emitting layer. We wish to report here preliminary results of a new study of the λ 5577 line using improved interferometric apparatus.

A Fabry–Perot interferometer of 45 mm aperture was placed in front of an $f/2$ 5 photographic objective of 7 in. focal length The entire instrument, including the photographic plate, was in an air-tight enclosure with carefully controlled temperature An Eastman 103*a*-*G* photographic plate and a Corning No. *GG*-7 filter were used.

The interferometer plates were coated with multilayer dielectric films Initially, the films consisted of nine layers, of which five were zinc sulphide and four were cryolite, and which gave a reflectance at λ 5577 of 98 per cent. With these films the peak transmittance of the interferometer was very low, the cause of this was ultimately traced to the fact that the plates were flat to within only about λ/20 According to a theory given by Chabbal[2], films of lower reflectance would give higher peak transmittance with no substantial loss of resolving power A five-layer film giving a reflectance of 87 per cent proved satisfactory and gave good photographs with 5 hr exposure to the night sky, whereas an exposure of 22 hr with the nine-layer films was insufficient

The observational procedure consisted of the following steps (1) The interferometer was adjusted visually using the λ 5461 line from a low-pressure mercury arc (2) A photograph was taken of the fringes formed with the λ 5461 line from a mercury-198 lamp (3) With the photographic plate moved to a second position, an exposure to the night sky was made On the same photograph was included

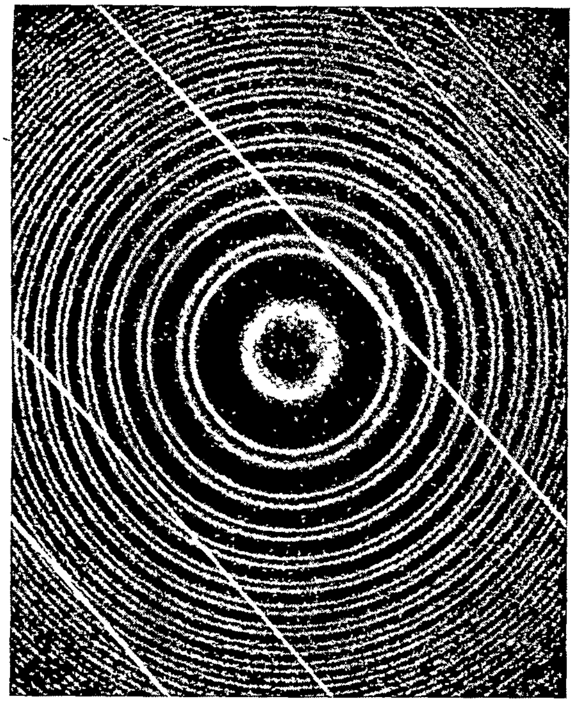

Fig 1 Photograph of interference fringes of λ 5577 of the night sky and of λ 5461 of mercury-198 The central fringe is of λ 5577 and the pairs of fringes are successively λ 5461 and λ 5577 going outward The bright streaks are star trails

a set of fringes from the mercury-198 lamp formed by a series of several short exposures made during the course of the exposure to the night sky (4) With the photographic plate moved to a third position, step 2 was repeated. The photographs made in steps 2 and 4 were compared to check the constancy of the adjustment of the interferometer

Fig 1 shows an example of the photographs obtained in step 3 with an interferometer spacer of 11 7 mm Of each closely spaced pair of fringes in this photograph the inner one is due to mercury-198 and the outer one to λ 5577 from the night sky. Bright streaks in the figure are star trails Fig 2 shows an intensity curve derived from a microphotometer trace made along a diameter of the fringe system of Fig 1 The advantage of having the mercury-198 fringes on the same photograph as the λ 5577 fringes is that by using the intrinsic width of the mercury-198 line as determined in separate experiments (we are indebted to Prof. F A Jenkins for the measurement of the width of the λ 5461 line from the mercury-198 lamp), it is possible to determine the instrumental width of the interferometer under conditions prevailing at the time of the exposure to the night sky.

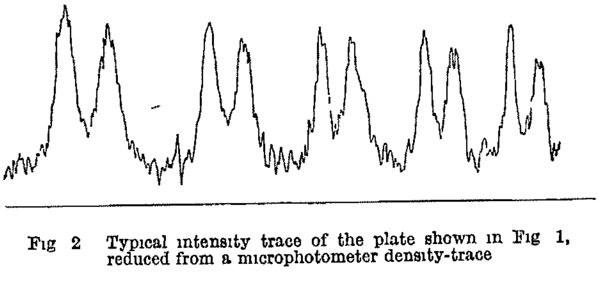

Fig 2 Typical intensity trace of the plate shown in Fig 1, reduced from a microphotometer density-trace

Doppler widths of λ 5577 were deduced from microphotometer traces under the following two separate sets of assumptions that the instrumental profile for a perfectly monochromatic line is (1) Gaussian or (2) resonance shape. Under assumption (1), the square of the half-width of the observed profile is the sum of the squares of the half-width of the instrumental contour and the half-width of the Doppler contour, while under assumption (2) the method of Voigt parameters[2] must be used

Our preliminary results under assumption (1) indicate a Doppler width at half-maximum intensity of 0 0148 A, which corresponds to a temperature of 231° K. Under assumption (2) we find a Doppler width of 0 0125 A, corresponding to a temperature of 155° K An examination of the intensity profile of the λ 5577 line as given by the interferometer indicates a condition intermediate between assumptions (1) and (2)

According to the latest published work[4], the height of the layer emitting λ 5577 is about 250 km At this altitude the temperature would be expected to be much higher than our results indicate However, more recent unpublished work (Roach, private communication) gives about 100 km for the height of the layer At the latter height the temperature is believed to be about what we find

We plan to continue this work after making improvements in our apparatus

We thank Prof John G Phillips, Berkeley Astronomical Department, for suggesting this problem and for his valuable discussions, Prof. F A Jenkins, Department of Physics, for many helpful suggestions, and Dr C D Shane, director of the Lick Observatory, for providing facilities for making the observations

Melting Points of Mono-*N*-*n*-alkylaniline Hydrochlorides

IN the course of other work, we have had occasion to prepare the series of liquid mono-*N*-*n*-alkylanilines ($C_6H_5NHC_mH_{2m+1}$) from $m = 1$ to $m = 12$ We have determined their refractive indices and also the melting points of their hydrochlorides[1]. A plot of refractive index against alkyl chain-length for the free bases gives a smooth curve characteristic of all homologous series in respect of physical properties The melting point against chain-length curve for the solid hydrochlorides is, however, very different. A large drop in melting point on passing from aniline to monomethylaniline hydrochloride is followed by a marked zig-zag to a minimum at $m = 6$, thence the melting points rise steadily with a small but definite alternation

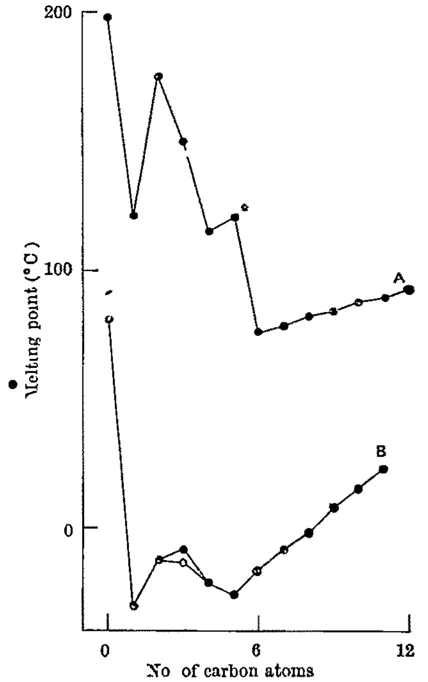

Fig 1 Curves of melting point against alkyl chain-length for (*A*) *N*-*n*-alkylaniline hydrochlorides , (*B*) α-*n*-alkylnaphthalenes

* The melting point of *N*-*n*-pentylaniline hydrochloride has been found to be 120°, in agreement with v Braun and Murjahn (ref 4), and not as previously quoted bv us (ref 1)

This kind of behaviour can be paralleled from other homologous series. Thus Anderson and Smith[2] find a very similar effect in the α-*n*-alkylnaphthalenes, with a minimum melting point at $m = 5$, followed by an alternating rise. This alternating rise is characteristic of predominantly aliphatic series and recalls in particular the rising periodicity in the melting points of the aliphatic acids[3], and appears to indicate that at about $m = 5$ or 6 aliphatic character begins to predominate in the alkyl–aryl series

Chemical Composition of the Melanin Granule and its Relation to the Mitochondrion

It has been suggested that the melanin-containing granules of melanocytes are derived from the mitochondria of these cells The term 'melanized mitochondria' has been used for describing the melanin granules[1] The main evidence to support this contention has been the demonstration of the presence in both mitochondria and melanin granules of the enzymes succinic dehydrogenase and cytochrome oxidase.

Some information is available as to the chemical composition of certain mitochondria[2,3]. It was felt desirable to obtain comparable information for the melanin granule.

Melanin granules were isolated from the choroid of ox eye by differential centrifugation at 0–4° C. Use was made of the high density of the melanin granules in order to obtain them in a relatively pure preparation Using a Waring blendor, the dissected-out choroids were homogenized in four times their volume of chilled physiological saline The tissue was further disintegrated by grinding with sand in a mortar. Much of the cell debris was removed by two centrifugations at 600 *g* for 3 min The granules were then sedimented by centrifugation for 30 min at 600 *g*. The sediment, on microscopical examinations of smears stained with methylene blue, showed the presence of a small amount of cell debris contaminating the preparation The sediment was then homogenized in 1 55 *M* sucrose (spec. grav. = 1 2) using a Potter–Elvehjem type homogenizer. The granules were sedimented from this homogenate by centrifugation at 1,000 *g* for one hour The centrifugation in the sucrose medium effectively separated the dense melanin granules from the contaminating lighter cell constituents. The sedimented granules were washed twice with distilled water and the washings kept for analysis

The lipid, ribose nucleic acid, soluble and insoluble protein and the iron, copper, zinc and melanin pigment content of the granule preparation were determined on a dry-weight basis

Lipid was estimated by extraction in 3 . 1 chloroform/methanol for 24 hr. at 25° C , followed by re-extraction of the granules in a Soxhlet apparatus for 12 hr , using the same solvent. The combined solvent was dried at 80–90° C for 24 hr. and the residue weighed Ribose nucleic acid was extracted by the Schmidt–Tannhauser–Schneider procedure and determined as pentose, using orcinol against a xylose standard Soluble protein was estimated as nitrogen in the distilled water washings of the granule. The washings gave a negative test for ribose nucleic acid. Insoluble protein was determined by a formol titration of the amino-acids liberated by hydrolysis of the melanin granule in boiling *M* potassium hydroxide for 12 hr. Melanin pigment was precipitated on acidification of the alkaline hydrolysate of the granule The pigment was purified by repeated solution in alkali and precipitation with acid[4]. The final precipitate was washed three times with distilled water, dried and weighed The granules were ashed to constant weight Copper and zinc in the ash were estimated as their dithizone complexes in carbon tetrachloride[5] Iron was determined as ferric thiocyanate in amyl alcohol. Most of the above determinations were performed, also, on a homogenate of choroid tissue.

Table 1 gives the analytical data for the melanin granule preparation and for the homogenate of

Table 1

Component	Melanin granule (per cent)	Choroid tissue (per cent)	Mito-chondrion (per cent)	References
Melanin pigment	35–40	5–6		
Lipid	1–5	9–13	25–30	(2, 3)
Ribose nucleic acid	Less than 0 3	1 3–1 7	0 8–1 6	(6)
Soluble protein	15–20	—	63	(2)
Insoluble protein	10–15	—		
Carbohydrate	5–10	—	—	
Ash	4–6	—	—	
	(µgm /gm)	(µgm /gm)	(µgm /gm)	
Copper	25–55	6–8	—	
Iron	800–950	200–300	200–400	(6)
Zinc	550–900	130–150	—	

choroid tissue. Comparable data on the mitochondrion are collated from various authors. The values given are extreme ranges found for several determinations. Melanin granule data are corrected for the presence of contaminating sand.

Not accounted for in the above analysis was some 15 per cent of the granule. This fraction appeared to have a nitrogen content of 15–20 per cent. It contained an acid-soluble red-brown pigment and, possibly, difficultly hydrolysable protein. The high nitrogen content suggests that the fraction not accounted for contained little lipid. It would appear that all or most of the lipid of the granule had been estimated by the initial extraction procedure.

For every constituent, there is a great difference between the compositions of the melanin granule and the mitochondrion. Especially significant is the low lipid and content of ribonucleic acid of the melanin granule in contrast to the high content of these constituents in the mitochondrion. The high copper, zinc and iron content of the melanin granule is particularly noteworthy. Most of, if not all, these mineral constituents appear to be localized in the melanin granule.

The above results do not support the view that the mitochondrion is converted into a melanin granule by a simple process of 'melanization'. If a conversion does occur it would appear to involve a drastic reorganization of the cell contents. It seems desirable to regard the melanocyte as a whole as being involved in the formation of the melanin granule, rather than the granule in isolation.

A further report of the above findings and their bearing on the problem of melanogenesis will, it is hoped, be published elsewhere.

I wish to thank Prof. Joseph Gillman for his invaluable advice and encouragement.

Production of Cancer of the Bile Ducts with Thioacetamide

DURING the past ten months, I have been feeding rats on thioacetamide with the object of studying chronic intoxication induced by that compound. 1 gm. of thioacetamide was dissolved in 60 ml. absolute alcohol, thoroughly mixed with 3,125 gm. of M.R.C. powdered rat cubes, and the alcohol evaporated off. One hundred and fifty rats received unlimited amounts of this mixture; fifty had the control diet consisting of powdered cubes mixed with absolute alcohol in the same ratio as in the experimental mixture. Groups of animals were killed at regular intervals from each batch for a careful study of the liver pathology.

The earliest changes of necrosis and monocellular infiltration soon gave place to proliferation of the bile ducts and regeneration of the liver cells. After feeding for eleven weeks with thioacetamide, localized areas of cholangiofibrosis—a term used by Opie[1] in his study of butter yellow (*p*-dimethylaminoazobenzene) tumour formation—appeared and increased progressively until at nineteen weeks they formed large nodules indistinguishable from cancer of the bile duct. Less frequently, collections of cystic bile ducts also developed, but neither hepatomas nor metastases have so far been encountered. These pathological changes recall those met with in rats fed with butter yellow[2], and they likewise develop in the same sequence. Of the 150 rats exposed to thioacetamide, about fifty died before the ninth week from destruction of the liver; of the thirty-six animals killed between nine and twenty-three weeks, twenty-two showed cholangiofibrosis, eighteen bile duct cancers and five cystic dilatation of bile ducts. Several conditions are, of course, not infrequently found in the same animal. Feeding is still going on in the remaining sixty rats. No such changes were found in the control rats. Under these conditions, therefore, it appears that thioacetamide is a powerful cause of bile duct proliferation which culminates frequently in cancer.

Fitzhugh and Nelson[3] described liver cirrhosis in rats fed with thioacetamide and mentioned tumours in two of fifty rats, one said to be a liver cell adenoma, the other a "histologically malignant tumour originating from liver cells". A more detailed study by Rather and his co-workers[4] emphasizes gradually developing diffuse fibrosis, nodularity of the liver and increase in weight of that organ. Apparently no tumours were discovered. Taki *et al.*[5] describe experiments in which groups of rats were fed butter yellow alone, thioacetamide for six to eight weeks followed by butter yellow, and thioacetamide and butter yellow together. No tumours developed; but the duration of these experiments was rather short and details presented are scanty.

Thioacetamide was introduced by Childs and Siegler[6] in 1945 as a medium for the control of orange decays. It is known to penetrate to the juice of the orange, and must therefore be considered as a possible risk to consumers of oranges. I must emphasize that the carcinogenic effects in rats have been obtained only after prolonged feeding, although the quantity of thioacetamide consumed by a rat each day cannot have been more than a few milligrams.

The investigation, which was suggested by Prof. G. R. Cameron, is still going on and full details will be published in due course.

Urinary Excretion of a Substance after a Single Dose

AFTER a single dose of a substance, its urinary excretion is commonly highest during the subsequent twenty-four hours, and then decreases with time. It is often desirable to compare different urinary excretion-rates, to extrapolate or interpolate, etc., so that any method of plotting the data such that the relationship is linear between some functions of urinary excretion and time has obvious advantages.

During some work on the metabolism of radioactive phosphorus after oral administration of a single dose, we have found that the cumulative excretion of phosphorus-32 is linearly related to the logarithm of the time. Line *A* of Fig. 1 is a typical example of our findings.

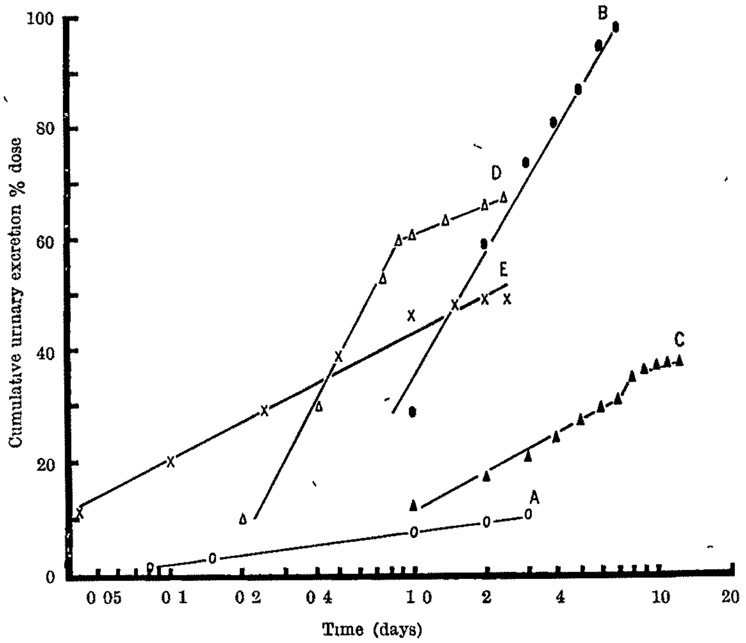

Fig. 1

This linear relationship appears to be a general one. Thus, line *B* is derived from some results reported by Van Der Werff[1], after the subcutaneous injection of bismuth-206 in the form of bismuth citrate. Line *C* shows another set of results re-plotted from the same paper, this time when the bismuth was mixed with a charcoal suspension and given by intravenous injection. This line shows a discontinuity, which may possibly be due to instability of the bismuth–charcoal suspension.

Wilkinson and Storey[2] have published some cumulative urinary excretion figures for polyvidone, a plasma substitute which is not metabolized. Line *D* shows the results from one of their cases, when plotted on a logarithmic time-scale. This line shows an abrupt change in slope which was not obvious when the data were plotted on a linear time-scale.

We have found this linear relationship very useful in our work on phosphorus-32, and we have expressed the slope of the line as the 'double time factor'. This is defined as the quantity *Q* excreted in the urine, such that if a quantity x is excreted in time t, a quantity $x + Q$ is excreted in time $2t$. It is numerically equal to the quantity excreted during the second day. It can be shown that

$$x \log 2 = Q \log \frac{t}{t_0}, \qquad (1)$$

where t_0 is the intercept of the line on the time axis. Differentiating, we have

$$\frac{dx}{dt} = 1·44 \frac{Q}{t}. \qquad (2)$$

Thus, the urinary excretion-rates may be expressed in terms of one parameter, the double time factor.

This method of plotting the urinary excretion has the further advantage that, where there are any discontinuities, these become obvious and precisely located in time.

It is not, however, the only possible way of endeavouring to fit cumulative excretion figures to an equation. For example, Haigh and Reiss[3] quote the relationship

$$x = x_{\max}\{1 - \exp(-\lambda t)\}, \qquad (3)$$

where λ defines the rate at which excretion proceeds, and $x_{\max}$ is the cumulative urinary excretion when this is complete. Their figures for the cumulative urinary excretion of iodine-131, when plotted on a logarithmic time-scale, give the line *E* of Fig. 1.

Equations (1) and (3) are not mutually consistent, and a particular set of results may prove to be a more or less good fit for either. The form of equation (3) is more logically explained than that of equation (1), but in a few cases tested by both equations, in general, it did not lead to better fits. Equation (1) has the advantages that it is very simple to apply, and that its use does not necessitate an estimate of the value of $x_{\max}$ which appears in equation (3), and which may be unknown. On the other hand, equation (1) is a divergent function of x, and in some cases, for example line *B*, obviously cannot hold when t becomes large.

Action of Ribonuclease on Certain Ascites Tumours

PREVIOUS papers[1] have described the action of ribonuclease on the cells of the Ehrlich carcinoma *in vitro*, and the object of the present communication is briefly to record results obtained *in vivo*, following the administration of ribonuclease to animals bearing various ascites tumours. These experiments involved three hundred animals carrying the Ehrlich or Krebs mouse carcinomata, or the Walker rat carcinoma 256.

The mean survival-time of the experimental animals was determined in relation to the number of injected

Table 1

Tumour (ascites)	Times of injection (days after implantation)	Nature of injection	Controls Mean survival-time	Controls No	Treated Mean survival-time	Treated No	P	Mean prolongation of survival-time (per cent)
Ehrlich carc	2	20 mgm ribonuclease	6 4	(25)	7 8	(25)	<0 01	22
,,	2, 3	10 mgm ribonuclease	6 5	(10)	8 8	(10)	<0 01	36
,,	5, 5	8 mgm ribonuclease + 0 1 mgm nucleot	8 6	(15)	9 8	(15)	<0 05	15
,,	7, 8	2 mgm ribonuclease† + 0 1 mgm nucleot	8 3	(10)	23 5	(10)	<0 01	183

‡ Excluding one animal in which the tumour regressed

cells. Confirming the results obtained by Goldberg *et al.*[2], the curve giving the relation between the number of cells injected and the mean survival-time shows three distinct parts The first corresponds to inocula very rich in cells, when the mean survival time does not vary significantly if the number of cells inoculated is more than 1 million The second part of the curve shows that below this limit the mean survival-time varies in proportion to the density of the inoculum Finally, a third section, corresponding to the development of solid tumours, extends towards high survival-times and is limited by the minimum number of cells, of the order of 10,000, necessary for transplantation In the present experiments, doses of between three and thirty million cells were used Treatment began at least two days after implantation Equal numbers of control and treated animals were used in each experiment, and the results were examined statistically The enzyme was administered intraperitoneally by a single or daily injection (the latter being the more effective), or by injection at intervals of several days, and two kinds of ribonuclease preparation were employed (1) Armour's 'RNase' purified by chromatography, the largest and most important fraction was used (peak D)[3], (2) commercial Armour's 'RNase' The sample employed contained 25 per cent of non-protein material of low molecular weight and 75 per cent of material homogeneous in the ultra-centrifuge but separable by chromatography into inactive ribonuclease (10 per cent), partially active ribonuclease (25 per cent), fully active ribonuclease (60 per cent) and a further 5 per cent of a protein impurity without proteolytic activity

In the majority of cases mixtures of ribonuclease and nucleotides were employed, since other work had indicated the importance of the latter for enzymatic action[1] This point will be discussed in further detail elsewhere

The ribonuclease solutions were freshly prepared and sterilized by Seitz filtration, their pH being that of the physiological saline or sterile distilled water used as a control The results (Table 1) show that the treatment induces a significant increase in mean survival-time These observations must be considered in relation to those of Klein[4], who showed that inoculation with tumour cells of which the ribonucleic acid content had been reduced by storage at 4° C was less effective than with fresh cells, it appears probable that cellular multiplication can in fact be modified through changes in the level of ribonucleic acid in proliferating cells It is also of interest to compare these results with those obtained with amphibian eggs[5], and with those of Brachet with onion roots[6]. In these cases similarly, ribonuclease diffusing across the cell membranes had a very clear anti-mitotic effect The present results appear to indicate that it is possible enzymatically to influence the ribonucleic acid and growth-rate of rapidly proliferating cells by an action possibly similar in principle to that of xanthine oxidase upon spontaneous mammary carcinomata of the mouse, as described by Haddow[7].

Deoxyribose Nucleic Acid Values in Tumour Cells with Reference to the Stem-cell Theory of Tumour Growth

Recent technical developments have increased the accuracy and scope of photometric measurements of deoxyribose nucleic acid on Feulgen-stained nuclei By using the scanning photoelectric device[1,2] in conjunction with the cell-crushing method[3], it is possible to make accurate measurements not only on interphase nuclei, but also on cells in mitosis It has been shown that increase of deoxyribose nucleic acid occurs during interphase[4,5] Hence measurements of the deoxyribose nucleic acid during mitotic stages are not subject to variation due to this synthesis

A series of measurements of deoxyribose nucleic acid in cell nuclei of the Krebs's 2 and Ehrlich's mouse ascites tumours have been made and the results are shown in Figs 1 and 2 , the non-tumour inflammatory cells provide a useful marker for the diploid value of deoxyribose nucleic acid (2c) A wide spread of figures for the acid content about the octoploid value (8c) is obtained for cells at metaphase (standard deviations Krebs's ± 7 5, Ehrlich's ± 6 3) If all these cells at metaphase completed division then a similar spread would be expected for cells at telophase, which, however, show only a small scatter about the tetraploid figure (4c) (standard deviations Krebs's ± 0 42 Ehrlich's ± 0 54) Since a metaphase of 8c will normally give rise to telophases of 4c, this suggests that in this material normal division with successful cell-cleavage occurs mainly among cells which at metaphase contain approximately the 8c amount of deoxyribose nucleic acid, and which are balanced in the genetical sense The cells which at metaphase depart from the 8c value of deoxyribose nucleic acid (that is, unbalanced cells) probably arise from non-4c telophase cells produced by the occasional abnormal division of an 8c metaphase The non-8c metaphases form a large proportion of the sample, and if these cells linger at metaphase for long periods this would explain the relative scarcity of non-4c telophases (which were not detected in the present measurements) from which they may be derived. Incomplete reduplication of the chromosome complement during interphase may also be a factor in the production of non-8c metaphases The metaphase cells which do not divide probably undergo restitution or division without cell-cleavage, and as a result restitution nuclei, binucleate and multi-nucleate cells are fairly common in these tumours. Lasnitzki has arrived at similar conclusions of reconstruction from metaphase, on the basis of cytological evidence, in the *S*37 sarcoma and *T*2146 ascites tumours[6]

These observations agree with the results of other workers on which the recent stem-cell theory of tumour growth is based. According to this theory only a fraction of the cells in the population are capable of normal and regular mitosis, and tumour growth is thus due mainly to the division of these stem cells, which produce not only new stem-cells but also the rest of the population. This phenomenon has been described in ascites tumour material by Levan and Hauschka[7] and Makino and Kano[8] on the basis of chromosome counts. Accurate counts are possible only at metaphase, and the stem-cel theory was derived from the observation that a characteristic mode of chromosome numbers persisted throughout many generations of transplants The results presented here would appear to suppor the stem-cell theory of tumour growth

A similar scatter of metaphase values and a smal spread of telophase values has recently been observed in a carcinoma of the cervix uteri in man[9]. If this phenomenon is of general occurrence in human tumours, then in estimating the rate of proliferation of a tumour it is necessary to ascertain the proportion of cells at telophase in the biopsy section, as well as the total mitotic index.

The spread of deoxyribose nucleic acid values fo cells at metaphase in the Krebs's and Ehrlich's ascites tumours agrees with the histograms of chromosome numbers in the same tumours reported by Hauschka and Levan[10] This is to be expected since an accurate measurement of deoxyribose nucleic acid in a mitotic stage is related to the number of chromosomes presen in the cell, provided that the variation in deoxyribose nucleic acid content of individual chromosomes is small. The advantage of the method of deoxyribose nucleic acid measurement presented here is tha it makes possible the determination of chromosome numbers, not only at prophase and metaphase, bu also at anaphase and telophase, and under condition when visual counting methods cannot be used Thi will be discussed in a succeeding publication[11] Further investigations are being made by thi technique with special reference to immunogeneti aspects of tumour growth and will be reported elsewhere.

Identification of Hypocalcified and Demineralized Areas in Sections of Human Enamel

Hitherto, poorly calcified areas in the enamel of ground sections of teeth have been detected either by their permeability to stains insolubility in dilute acid or by their low absorption of soft X-rays (so-called Grenz-rays) Gottlieb, Diamond and Applebaum[1] came to the conclusion that "it is impossible by means of microscopic ground section study, to differentiate between enamel in the matrix stage and fully calcified enamel". During the preparation of ground sections of teeth with obviously poorly calcified areas of enamel, we were struck by the appearance of these areas when sections were examined in water by transmitted and reflected light By transmitted light they appear opaque, while the normal enamel is translucent or transparent, by reflected light they appear white. When cleared and mounted in the routine histological manner, they become translucent, and it is often difficult to distinguish them from normal transparent or translucent enamel, but they can be distinguished from pigmented enamel by the lack of brown pigmentation Using these criteria, we were able to show, in proved cases of immature acid-insoluble enamel, almost complete agreement between the dark areas in the water-mounted sections and those observed on an X-ray negative after exposure to soft X-rays (Figs 1 and 2) The soft X-rays used were produced by a commercial type 'Raymax' tube with a tungsten target and operated at 20 kV peak and about 3 m amp emission current.

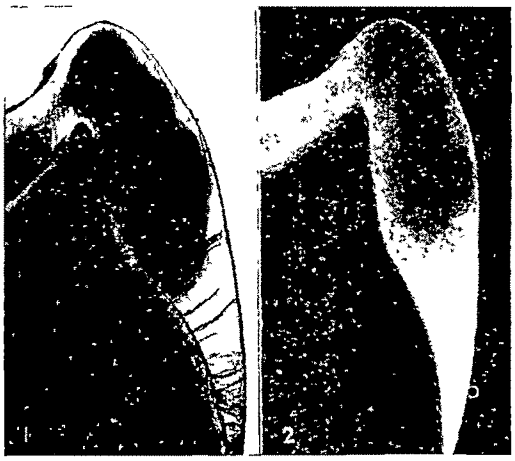

Fig 1 Ground section, mounted and photographed in water, of a grossly visible brownish opaque hypocalcified area in the cuspal enamel of a molar

Fig 2 Grenz-ray photograph of the same section

It was also found that some areas of white or brown opaque enamel, as observed on the enamel surface by reflected light and obviously poorly calcified, were soluble in acid In some cases it was difficult to obtain a clear picture of a reduced concentration of calcium salts in sections of these areas using the soft X-rays (also noted by other workers), but with the water-mounted specimens a well-defined area of opacity was always obtained. The evidence suggests that examination of ground sections in water provides a means whereby areas of poor calcification can be detected The method, however, is essentially qualitative and does not satisfactorily show differences in the degree of concentration of calcium salts The best results are obtained by studying photographic prints of the sections and, where desirable, comparing them with prints of soft X-ray negatives. It is also clear that solubility in acid is not a test for all degrees of hypocalcification

This work suggests that poorly calcified areas in the enamel may be divided into two main types, according to whether the factors retarding calcification acted before or after the critical point of maturation (that is, solubility of the enamel matrix) is reached. The first type consists of immature enamel in which the matrix is insoluble in dilute inorganic acids and is pre-critical in origin, the second type consists of soft enamel which is soluble in acids and is post-critical in origin. Post-critical hypocalcification when examined in water-mounted sections shows less, or an absence of, the yellowish appearance which is seen in immature enamel or pre-critical hypocalcification This latter is quite distinct from the brown pigmentation seen in cleared sections of normal enamel Examination of ground sections also suggested that post-critical calcification during tooth development does not proceed from the tips of the cusps or incisal edges as at the critical stage of calcification or maturation, but in an 'incremental' direction. While we are unable to differentiate in all cases, with certainty, pre-critical from post-critical hypocalcification in water-mounted sections, the distinction between hypocalcified and mature hard enamel is clearly shown

While both pre- and post-critical hypocalcified opaque areas can be seen in the gross specimen, sections of apparently normal teeth when mounted in water may show opacities which on clearing appear as either transparent or brown pigmented areas or bands along incremental layers or striæ of Retzius The brown or transparent bands which appear opaque when examined in water would seem to be hypocalcified Our findings agree with those of Thewlis[2], who found that only a certain percentage of pigmented and transparent areas gave evidence of less than normal concentration of calcium We also observed that the appearances and distribution of brown pigmented enamel were profoundly affected by clearing agents.

When ground sections of enamel showing advanced carious lesions without cavitation are examined in water and by soft X-rays, a similar correlation to that described above between the opacity in water and the area of low absorption of the X-rays exists, and suggests that the water technique may be used to identify areas of demineralization Evidence of demineralization in early carious lesions is often difficult to obtain or inconclusive using soft X-rays, but with the water technique, the opacity is consistently present

We have also noted that the early white carious lesion is soluble in acid, whereas the deeply stained brown lesion tends to be insoluble in dilute inorganic acids This appears to be due to a change in the character of the enamel protein consequent upon its permeation by material from the mouth

Thanks are due to Dr E L Yates, of the Physics Department, for his help with the soft X-ray work, and to Dr J Thewlis, of the Atomic Energy Research Establishment, Harwell, for his criticisms of the investigations I also wish to thank the Medical Research Council for an expenses grant

Do Tracers measure Fluxes ?

TRACERS are used extensively for the purpose of measuring the absolute flux of a substance through a membrane from, say, side A to side B in the presence of a flux from B to A Often the system is in a steady state and the two fluxes are equal, but the rate of appearance of tracer atoms (x') on side B remote from their origin (side A) is used as a measure of the flux $A \rightarrow B$, with due mathematical allowance for any back flow of x', $B \rightarrow A$.

When this technique is applied to measurement of water permeability of cell walls, the rate of movement per unit difference of concentration of isotopic water is sometimes less by a factor as high as 50 from the rate of movement resulting from a unit difference of water concentration imposed by the presence of dissolved salts[1] Frog skin shows similar anomalies[2] As a further example of anomalous rate of tracer movement, there is the fact that the flux of potassium ions through muscle cell membranes is less when found from the rate of transfer of potassium-42 than when it is deduced from the membrane conductivity on the assumption that potassium ions carry nearly all the current

The purpose of this communication is to suggest that the rate of transfer of a tracer across a membrane may bear no direct relation to the absolute flux through the membrane, this is not to imply that the tracer has any peculiar properties The explanation is of the same kind as the one recently demonstrated by Hodgkin and Keynes[4] Suppose the membrane is several times as thick as the traversing molecule (x or x') and that there can be a series of molecules (xxx) in file in a narrow pore or channel. Collision of an x' on side A can lead to formation of the file $x'xx$ with displacement of an x into the solution on side B. If the next molecular event is a collision on side B, the original xxx is restored, no tracer has passed, yet the fluxes $A \rightarrow B$ and $B \leftarrow A$ are one unit. To transfer x' to side B requires a succession of events of probability less than unity, yet each event can contribute one molecule to one or other flux Thus, when the pore is long and thin on the molecular scale, the rate of transfer of x' does not measure the flux $A \rightarrow B$. Only when the molecules in the pores can pass freely side by side, or when the membrane is so thin that a file does not exist, can one expect tracer movement to be proportional to the real flux The process when there are long pores recalls Bernal and Fowler's explanation[5] of the rapid diffusion of hydrogen ions where an ion at one end of an aqueous medium can displace one from the other end without moving there itself

In the system described, if an osmotic unbalance exists between A and B, the greater collision-rate on the high-activity side (say, B) will tend to lead to the file being filled with molecules (x) from that side, and this would reduce the rate of transfer of x' against the osmosis There could be many collisions of x' with side A which lead to ejection of an x into side B, but the probability of x' making its way into B against the net movement due to osmosis would be small Thus here an osmotic unbalance can affect the rate of diffusion of tracer, in distinction to the case in free diffusion A similar situation has been discussed recently by Ussing[6] The argument would apply to diffusion of a solute if solvent passage through the pores interfered with or assisted passage of solute A possible example of this effect has been observed (Harris, unpublished results) on the movement of sodium from muscle, if water is moved osmotically from the cells, there seems to be some added efflux of sodium ions

It is pertinent to remark here that some explanations of the anomalous rates of water movement have invoked a bulk flow of water due to an osmotic unbalance. As pointed out by Chinard[7], osmotic unbalance does not cause bulk flow

Incidence of Hæmoglobin C in the 'Coloured' Population of Cape Town

HÆMOGLOBIN C, an electrophoretically abnormal variant of human hæmoglobin, has recently been reported from West Africa by Lehmann and Edington[1] In the United States, from which the abnormality was first described, Smith and Conley[2] found the hæmoglobin C trait in 2 per-cent, and Schneider[3] in

3 per cent, of American negroes. The American negro has an average incidence of the sickle-cell trait, which is dependent on another abnormal hæmoglobin, of about 8 per cent[4]. The sickle-cell gene was brought to America from Africa by the slave trade; it seems possible that the same may be true of the gene for hæmoglobin *C*. In West Africa, Edington and Lehmann[5] found hæmoglobin *C* to be present in 12 per cent and sickling in 20 per cent of two hundred negro out-patients. Thus the incidence of hæmoglobin *C* in African populations, for many of which the sickling incidences are known, will be of interest.

The 'coloured' population of Cape Town is derived from European, Hottentot, Bantu and Malay elements. In the seventeenth century also one ship-load of slaves from West Africa was imported into the Cape settlement. The Bantu elements came chiefly from Madagascar and Mozambique, while the 'Malays' were from India and Ceylon as well as from the Malay Archipelago[6]. The incidence of sickling in the coloured population is 0·6 per cent[7].

Blood specimens sent to the laboratory for routine serological tests were examined for abnormal hæmoglobins by paper electrophoresis. All age-groups and both sexes were represented among the subjects, but adult females predominated. A modified apparatus of Kunkel and Tiselius[8] was used, with Whatman's No. 1 filter paper and a barbitone buffer of *p*H 8·6 containing 1·84 gm. diethylbarbituric acid and 10·3 gm. per litre of its sodium salt. Washed packed red cells were diluted with approximately two volumes of buffer and lysed by freezing and thawing. The hæmoglobin preparations were run for 3 hr. at a potential gradient of about 12 V./cm., and the patterns stained with bromphenol blue. In 219 examinations, two examples of a hæmoglobin of similar mobility to hæmoglobin *C* were found. In each case the abnormal hæmoglobin was associated with a normal component, in the typical form of the hæmoglobin *C* trait. Both occurred in clinically healthy females attending an antenatal clinic, and the findings were verified by repeated runs alongside specimens from known carriers of sickle-cell hæmoglobin. Fig. 1 shows three typical patterns.

The incidence of hæmoglobin *C* in the Cape coloured population thus appears to be about 0·9 per cent, that is, of the same order as the sickling incidence. Further studies of this and other African groups are in progress.

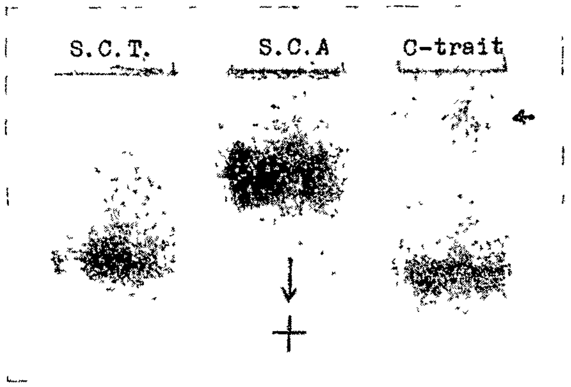

Fig. 1. Electrophoretic patterns from bearers of the hæmoglobin *C* trait (the arrow points to the *C* component), the sickle-cell trait (S.C.T.) and a patient with sickle-cell anæmia (S.C.A.)

I am grateful to Prof. J. V. Neel, of the University of Michigan, for encouragement, and to Dr. I. D. Davids for help in obtaining specimens.

THE discovery of hæmoglobin *C* has recently been followed by that of hæmoglobin *E*[1]. Hæmoglobin *C* is usually identified by its behaviour on paper electrophoresis in alkaline buffer. Hæmoglobin *E* behaves so similarly in this investigation that a newly found abnormal hæmoglobin showing the properties of hæmoglobin *C* can only be identified as such after comparison with both *E* and *C*. This seemed particularly important when Dr. P. Brain discovered the hæmoglobin *C* trait in Cape coloured individuals. Hæmoglobin *C* has been found in American negroes and in the Gold Coast, but so far it has not yet been possible to demonstrate its presence in East Africa. On the other hand, hæmoglobin *E* has been found in Asiatics, particularly in Siam[2] and recently in Ceylon[3]. As the Malays have contributed considerably to the Cape coloured element, it was important to see whether the hæmoglobin *C* was in fact *C* and not *E*. By the kindness of Miss Virginia Minnich, a sample of hæmoglobin *E* trait was made available, and it was possible to ascertain that what has been described as hæmoglobin *C* in West Africa[4], and particularly the newly found hæmoglobin *C* of Dr. Brain, were in fact hæmoglobin *C*.

Endoparasitism in Trombiculid Mites

ENDOPARASITISM has hitherto been considered exceptional among the trombiculid mites and confined to the two genera *Hannemania* and *Endotrombicula*, the larvæ of which bury themselves in the skin of amphibians. Recent discoveries have, however, shown that endoparasitism is much more widespread among the Trombiculidae than has been suspected. Some of the endoparasitic forms are indeed very common but have been overlooked. Two distinct habits are recognized: burrowing in the skin, and living in the nasal cavities.

Intranasal species of trombiculids were first found by one of us while searching for pulmonary mites in rodents of Central Africa (Ruanda-Urundi and the Belgian Congo)[1]. A total of nine such species in four genera/subgenera (some of which are as yet undescribed), mostly related to *Schoutedenichia* Jadin and Verc and the Gahrliepinae[2], have since been found in the Congo More than eight other intranasal species have been found in Malaya and Borneo, mostly belonging to *Doloisia* (*sensu lato*) and to the *Euschongastia indica* group[3] A related species, *D. oculicola* (Wom , 1952) from Ceylon, is conjunctival. The intranasal species occur at all depths in the nasal cavities, and it is recommended that the entire head be split open after leaving it in the refrigerator overnight—this does not kill the mites. A most interesting finding in the Malayan rain-forest is that the spiny rat *Rattus rajah*, which is peculiar in being unusually lightly infested by external trombiculids (only three per rat), is the most heavily infested by the intranasal species (about seventy per rat). The same has been observed in the Congo for the Gambia rat, *Cricetomys dissimilis*

The second endoparasitic habitat is hypodermal or intradermal, the larvæ being either embedded in pits or even encysted and in some cases showing signs of metamorphosis *in situ*. The genus *Endotrombicula* itself appears to comprise slightly modified species of *Schongastia* which infest the skin of amphibians—this genus is now under revision. In the Congo, fifteen species in four genera (including Gahrliepines) have been found to be hypodermal in rodents, while Lieut -Colonel R. Traub (Traub, R , and Morrow, Mary L , in the press) has found a hypodermal species of *Gahrliepia* nr. *decora* Wom , 1952, in a rat in North Borneo.

These endoparasitic forms are of exceptional taxonomic importance as well as of great biological interest It is to be hoped that this communication will stimulate a wider attention to them

Polychaeta New to the British Isles

IN a recent survey of the littoral and sub-littoral Polychaeta of the Isle of Man, about seventy of the species found were new to the area and to the Irish Sea generally Among these are sixteen species which do not appear to have been recorded previously from the British Isles. The new records are

Hesionidae	*Podarke pallida* Claparède (ref 1)
Pilargiidae	*Ancistrosyllis groenlandica* McIntosh (ref 2)
Nephthydidae	*Nephthys rubella* Michaelsen (ref 1)
Eunicidae	*Staurocephalus neglectus* Fauvel (ref 1)
Paraonidae	*Paraonis gracilis* Tauber (ref 3)
	Paraonis fulgens (Levinsen) (ref 1)
	Aricidea suecica Eliason (ref 3)
	Aricidea (*Cirrophorus*) *branchiata* (Ehlers) (ref 4)
Apistobranchidae	*Apistobranchus tullbergi* (Théel) (ref 5)
Spionidae	*Scolelepis ciliata* (Keferstein) (ref 1)
Ctenodrilidae	*Zeppelinia dentata* Monticelli (ref 1)
Capitellidae	*Capitomastus minimus* Langerhans (ref 1)
Maldanidae	*Praxillura longissima* Arwidsson (ref 7)
	Nicomache trispinata Arwidsson (ref 1)
Terebellidae	*Polycirrus plumosus* (Wollebaek) (ref 6)
	Amaea trilobata Sars (ref 1)

Of these, the most interesting are *Ancistrosyllis groenlandica* and *Aricidea branchiata*. The former species was previously known only from the Davis Straits[2], the latter from South Africa[4], and in each case from a single specimen only. Neither has been recorded since the original description

A previous record of *Scolelepis ciliata* from the Isle of Man referred to specimens from a sea-water storage tank[8], while the present record is the first from a natural habitat

Of the remaining species, *Capitomastus minimus* is recorded at Naples and Madeira, and *Zeppelinia dentata* at Naples only[1] , all the rest are recorded from Scandinavia, the North Atlantic, the North Sea or the English Channel, and their occurrence in the British Isles is not surprising.

A fuller account of the survey is in preparation.

Role of Pectic Enzymes in the *Verticillium* Wilt Disease of Cotton

THE mechanism by which *Verticillium dahliae* produces symptoms of wilt disease in young cotton plants has been investigated by assaying solutions from cultures of the pathogen on liquid media for the following activities : (*a*) protopectinase, from the time taken to macerate standard slices of potato tuber tissue , (*b*) pectinesterase, from the rate of liberation of acidic groups from a solution of a high methoxyl pectin , (*c*) toxicity, from the rate of killing of parenchyma cells of potato tuber slices , (*d*) wilting, from the time taken to cause irreversible wilting of cotton shoots , (*e*) vascular browning, from the degree of discoloration of the vascular elements of cotton shoots.

Filtrates from cultures on a synthetic medium containing sucrose, potassium nitrate and mineral salts had little protopectinase activity, little or no pectinesterase activity, were relatively non-toxic to parenchyma cells and caused little vascular browning. Cotton shoots placed in these solutions wilted irreversibly in 8–10 hr Similar results were obtained after the solutions had been dialysed or autoclaved. When shoots were placed in these culture filtrates, it was observed that wilting was greatly delayed when conditions were unfavourable for transpiration. It was also noted that wilted shoots did not recover on transfer to water unless the lower part of the stems was removed In experiments in which water-uptake and water-loss from shoots placed in culture filtrates were followed gravimetrically, it was seen that while loss of water was only slightly reduced, uptake of water was greatly retarded by these filtrates

Solutions from cultures on a liquid medium containing glucose, ammonium sulphate, pectin and mineral salts had quite different properties These solutions had high protopectinase activity, and caused irreversible wilting of shoots in 8–10 hr. , these shoots also showed pronounced browning. The filtrates had little or no pectinesterase activity. On autoclaving, protopectinase activity was lost and toxicity to parenchyma cells was very much reduced, as was also the ability to cause vascular browning. The wilting activity of these solutions was, however, little affected.

It would seem, therefore, that the ability of these culture filtrates to cause wilt cannot be ascribed to enzyme activity; the development of other, equally characteristic, symptoms of disease such as vascular browning may well, however, be caused by the activity of one or more enzymes. A certain amount of evidence has been obtained which indicates that the enzymes responsible for protopectinase activity may be active in this respect.

In recent work of a similar nature with the wilt disease of tomato plants caused by *Fusarium oxysporum f. lycopersici*[1,2], pectinesterase was considered to play an important part in the development of typical disease symptoms. Since culture filtrates of *V. dahliae* had little or no pectinesterase activity, this enzyme played no part in the development of wilt symptoms in the experiments described above. It may also be noted that a highly active pectinesterase preparation from orange peel was far less effective in producing disease symptoms than were the culture filtrates.

Physiological Disease of Rice attributable to Iron Toxicity

In the course of an investigation on the influence of the intensity of reduction of a submerged soil on the growth and yield of rice, it was observed that three of the twenty-seven treatments studied exhibited symptoms strongly suggestive of a widespread disease of rice of unknown cause, described in the literature as 'mentek' in Java[1-3], 'penyakit merah' in Malaya[4], browning disease in Ceylon[5,6], and under various local names in India and Burma[2,7,8].

The symptoms were first observed about five weeks after transplanting in submerged soil, when brown spots began to appear on the older leaves. Gradually, the tips of these leaves took on a reddish-brown colour which spread towards the base, especially along the edges. As the disease progressed, these parts turned brown, dried up and curled inwards. In the early stages, the younger leaves and the unaffected parts of the older leaves were green; but with time the younger leaves also began to show the brown speckling, while the older leaves finally dried up completely giving the plant a scorched appearance. The closest examination of the lesions on the leaves failed to reveal the presence of any suspect organism. The effect on growth, flowering and final yield varied with the severity of the disease. In mild cases growth, though retarded, was not seriously affected and rapid recovery was made about the time of heading. The yield of grain was not appreciably below that of the unaffected plants. The severely affected plants were markedly stunted, tillered poorly, headed late, and produced thin, narrow panicles with a high proportion of sterile florets. Roots of the diseased plants were poorly developed, coarse in texture, and dark brown in colour, in contrast to the profuse fine-textured, reddish-brown roots of the unaffected plants.

These symptoms are somewhat akin to those of potassium deficiency, and have, in fact, been ascribed to it[1,2,8,9]. However, in view of the high initial level of exchangeable potassium in these experiments, potassium deficiency may be excluded as the direct cause of the disease. The chemical analyses of the percolates taken from the pots at intervals during the period of growth appear to provide an explanation of the disturbance. A close association was noted between the severity of the disease and the concentration of reduced products, especially ferrous iron, in the percolates. This is summarized in Table 1.

Table 1

Symptoms	Av. wt. (gm.) per pot of 6 plants			Ferrous iron (p.p.m.) in percolates on		
	Grain	Straw	Roots	17/8*	3/9	6/10
None	28.2	61.4	30.0	3.2	20.5	80.0
Mild	23.6	53.4	25.7	35.8	81.6	354
Moderate	16.6	41.0	16.3	88.3	207	435
Severe	4.9	20.8	5.7	146	275	525

* Thus, 16 days after flooding and transplanting

The symptoms were absent in the treatments in which (*a*) there was drainage, (*b*) there was a high initial concentration of nitrate, (*c*) submergence was delayed, (*d*) sodium nitrate was added to retard the reduction process.

We have no first-hand experience with the disease under field conditions, but a consideration of the following features[3] of the disease has led us to the view that the disturbance observed under greenhouse conditions and the physiological disease described in the literature probably have a common cause: (*a*) the disease affects only lowland rice; (*b*) it is associated with very poor drainage; (*c*) it appears when fields have been unduly long under water prior to planting; (*d*) draining the fields is a common remedial measure. We hesitate to make any general recommendations from this limited study, but we suggest that any remedial measures should be directed towards reducing the accumulation of ferrous iron. Among the practical ways of doing this are: delaying submergence after transplanting, providing controlled subsoil drainage, minimizing the addition of organic matter, and using sodium nitrate to retard the reduction process.

Further experiments are in progress and a detailed report will be published elsewhere.

The Gregarious Setting Reaction of Barnacles as a Measure of Systematic Affinity

PREVIOUS experiments have shown that cyprids are stimulated to settle and metamorphose by contact with the epicuticle of barnacles of their own species[1]. Other species are comparatively ineffective in promoting settlement The question remained whether other species have any stimulating effect at all and, if so, whether closely related species are more effective than barnacles of other families. To investigate this, seven parallel series of twenty-five experiments were carried out In each experiment twenty freshly collected cyprids of *Balanus balanoides* were presented with a flat stone, weighing between 5 and 15 gm and of rough granite, in a crystallizing dish holding about 250 ml of sea water. In one of the series the stones were bare In five other series two or three recently detached and active adult barnacles, belonging respectively to the five species listed in Table 1, were placed on top of each stone Some of these species differed from *B balanoides* in profile and activity, *Verruca* being flatter and *Chthamalus* less active The setting behaviour of cyprids is considerably affected by surface topography[2] and water currents (Crisp, private communication), so a seventh series of experiments was included, in which disarticulated shell plates of *B balanoides* were laid flat on the stones, there being no live adult barnacles to disturb the water

Table 1

Series No	Species on stones	Family represented	No of cyprids of *B balanoides* settled in 24 hr	Total
1	None		0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0
2	*Chthamalus stellatus*	Chthamalidae	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0
3	*Verruca stroemia*	Verrucidae	0 0 0 0 0 0 0 0 0 0 2 0 0 0 0 0 0 0 0 0 0 0 0 0 0	2
4	*Elminius modestus*	Balanidae	0 0 0 1 0 0 0 5 3 2 0 0 0 3 0 0 0 0 0 0 0 0 0 1 0	15
5	*Balanus crenatus*	,, ,,	1 0 0 0 0 0 0 0 0 1 1 0 1 1 0 1 0 0 0 0 0 1 6 0 0	13
6	*Balanus balanoides*	,, ,,	0 0 1 0 1 2 2 2 7 6 0 7 2 4 0 0 1 0 0 3 6 14 9 1 3	71
7	Shells only of *B balanoides*	,, ,,	0 0 0 2 0 0 2 3 4 0 2 1 7 3 1 4 0 0 0 1 1 1 8 0 0	40

After twenty-four hours, the numbers of cyprids which had cemented themselves to the stones were recorded (Table 1) Many settled on stones bearing adults or shell plates of their own species, and significant numbers settled on those bearing other species belonging to the same family (Balanidae). *Elminius modestus* had about as much effect in stimulating settlement as *Balanus crenatus*, a fact agreeing with the evidence from the anatomy of both adults[3] and larvæ[4] that these two genera are very closely related. The representatives of the other families of sessile barnacles (Verrucidae and Chthamalidae) had no appreciable stimulating effect, presumably because their epicuticles are too different, in chemical composition or minute sculpturing, from that of *Balanus*.

Evidently the discriminatory powers of gregarious larvæ can be used to provide evidence of the degrees of relationship between related species. It is intended to investigate the interrelationships of the British species of *Spirorbis* (Serpulidae) by this method. *Spirorbis* provides very favourable material for such experiments[5], and the genus needs systematic revision.

Independence in Publication

MR ARTHUR BRYANT once told a story which is typical, one hopes, of the sturdy independence of the British people A dock strike was on, and enormous lorries were going in and out with impressive notices "By the authority of H.M. Government", or "By permission of the T U C ". Among them was a tiny donkey cart, driven by a little old man with a bashed-in bowler on the cart was a notice "By my own bloody authority".

In the pages of *Nature*, and of other journals, are many papers whose authors find it necessary to thank the Director of This, or the Chief Scientist of That, or the Ministry of Something or Other, for permission to publish them There is nothing imaginably secret about most of these, during the past year they have dealt with such matters as boiler scale, aircraft noise, paper electrophoresis, internal stress in glass, the sexing of the confused flour beetle and the ageing of quartz crystals Senator McCarthy is unlikely any more to make trouble between Britain and the United States because of such revelations nor could a sensible director of research feel anything but amused shame that anyone should need to ask his permission to reveal them

Could not this nonsense stop ? It would still be possible, if they wished, for the chief scientists, who are really quite amiable people, to follow the example of the late Lord Knutsford of the London Hospital, at the end of a meeting over which he presided "And now I have one particularly pleasant duty to perform—to propose a unanimous vote of thanks to myself for the excellent manner in which I have conducted the business" The occasional performance of a simple rite of that kind would obviate the necessity of requiring authors to thank (for example) the Director of Pedicular Research in the Ministry of Provocation for allowing them to publish their results (say) on the mean free path of insect vectors of disease

This letter is published without the permission of the professor of physiology in this College.

Institute of Physics, Industrial Spectroscopy Group (at 47 Belgrave Square, London, S W 1), at 5 30 p m —Prof W M H Greaves, F R S "Astronomical Spectroscopy"

University of London, British Postgraduate Medical Federation (at the London School of Hygiene and Tropical Medicine, Keppel Street, London, W C 1), at 5 30 p m —Dr T S Work "Protein Biosynthesis" * (From a series of lectures on "The Scientific Basis of Medicine")

University of London (in the Electrical Engineering Theatre, University College, Gower Street, London, W C 1), at 5 30 p m —Dr A L Cullen "The Measurement of Microwave Power using Electro-Mechanical Forces" * (Further lectures on February 17, 24 and March 3)

Royal Aeronautical Society (at Saunders-Roe Club House, Cowes, Isle of Wight), at 7 p m —Prof A D Baxter "Problems and Prospects of Rocket Propulsion for Aircraft"

Friday, February 11

Royal Astronomical Society (at Burlington House, Piccadilly, London, W 1), at 4 30 p m —Annual General Meeting

University of London (at the London School of Economics and Political Science, Houghton Street, Aldwych, London, W C 2), at 5 p m —Prof A Bertrand (École Nationale d'Administration, Paris) "The Recruitment and Training of the Higher Civil Servants in the United Kingdom and in France—a Comparative Study" *

Institution of Mechanical Engineers (at 1 Birdcage Walk, Westminster, London, S W 1), at 5 30 p m —Mr L W Bryant and Mr C F Cowdrey "Effects of Velocity and Temperature of Discharge on the Shape of Smoke Plumes from a Funnel or Chimney"

North East Coast Institution of Engineers and Shipbuilders (in the Lecture Theatre of the Mining Institute Neville Hall, Newcastle-upon-Tyne), at 6 15 p m —Prof J A Pope and Dr J Fitzgeorge "Temperature Measurements on Marine Diesel Engine Pistons"

Institute of Physics, Non-Destructive Testing Group (at 47 Belgrave Square, London, S W 1), at 6 30 p m —Mr S Jefferson "Industrial Applications of Radioactive Isotopes"

British Association of Chemists, London Section (at the Wellcome Institute, 183 Euston Road, London, N W 1), at 7 p m —Mr J B Davies "Work Study as Applied to the Chemical Plant Layout"

Royal Institution (at 21 Albemarle Street, London, W 1), at 9 p m —Dr A B Pippard "Superconductivity"

Saturday, February 12

British Psychological Society, Northern Branch (at the University, Leeds), at 2 30 p m —Symposium on "Communication"

APPOINTMENTS VACANT

Applications are invited for the following appointments on or before the dates mentioned

Lecturer in Horticulture—The Clerk of the Governors, Essex Institute of Agriculture, Writtle, Chelmsford, Essex (February 12)

Senior Analytical Chemist (with a degree or equivalent qualification, and preferably with experience in water, sewage and trade waste analysis), and a Junior Analytical Chemist (with a degree or equivalent qualification), in the Laboratories of the Pollution Prevention Department, Severn River Board—The Clerk, Severn River Board, Portland House, Church Street, Great Malvern, Worcestershire (February 12)

Research Fellow (organic chemist with experience of research, preferably on natural products) in the Department of Chemistry, at the University College of the West Indies—The Secretary, Inter-University Council for Higher Education in the Colonies, 1 Gordon Square, London, W C 1 (February 15)

Chemist or Physicist, Experimental Officer grade (with at least H S C (science) or equivalent, and preferably with some knowledge of electronic equipment), at a Ministry of Supply Research Establishment, near Bridgend, Glamorgan, for experimental work on the chemical and physical properties and the measurement of performance characteristics of pyrotechnic systems—The Ministry of Labour and National Service, Technical and Scientific Register (K), 26 King Street, London, S W 1, quoting F 18/5A (February 19)

Farms Director and Lecturer (with a degree or diploma in agriculture, together with practical farm management experience) in Farm Management—The Principal, Royal Agricultural College, Cirencester (February 19)

Metallurgist (with a good honours degree in metallurgy or equivalent professional qualifications, a good knowledge of physical metallurgy and of technology of engineering and constructional materials, including light alloys and/or special steels), at the Central Research Establishment, National Coal Board, Isleworth, Middlesex, to carry out research on metallurgical problems arising in mining operations—The National Coal Board, Establishments (Personnel), Hobart House, Grosvenor Place, London, S W 1, quoting TT/918 (February 19)

Deputy Director of the Institute of Education—The Registrar The University, Leeds 2 (February 21)

Physicist or Mathematician (with a first- or second-class honours degree in physics or mathematics), at the Ministry of Supply Headquarters, London, to investigate data reduction associated with ballistic instrumentation with a view to improving methods of presentation of results and to introducing methods of analysis applicable to automatic computing machines—The Ministry of Labour and National Service, Technical and Scientific Register (K), 26 King Street, London, S W 1, quoting A 7/5A (February 24)

Engineer (with a good honours degree in mechanical engineering or equivalent professional qualifications, and preferably some experience in research) at the Central Research Establishment, National Coal Board, Isleworth, Middlesex, to carry out research on underground transport of coal—The National Coal Board, Establishments (Personnel), Hobart House, Grosvenor Place, London, S W 1, quoting TT/922 (February 26)

Lecturer or Assistant Lecturer in Sociology, and a Demonstrator in Pharmacology—The Registrar, The University, Leeds 2 (February 26)

Staff Tutor in Science (Physics) in the Department of Adult Education—The Registrar and Secretary, The University, Bristol 8 (February 26)

Lecturer in Applied Mathematics—The Registrar, King's College, Newcastle-upon-Tyne (February 28)

Lecturer in the Department of Logic and Metaphysics—The Secretary, The University, Edinburgh (February 28)

Lecturer (with an honours degree in physiology and experience in teaching experimental physiology to honours students) IN THE DEPARTMENT OF PHYSIOLOGY—The Secretary, Bedford College, Regent's Park, London, N W 1 (February 28)

Reader in Experimental Physics at Queen Mary College—The Academic Registrar, University of London, Senate House, London, W C 1 (March 3)

Chemist, Assistant Experimental Officer or Experimental Officer grade (with H N C in chemistry or equivalent qualification, and good experience of modern methods of analysis), for the mineral analysis of plants—The Secretary, East Malling Research Station, near Maidstone, Kent (March 5)

Chair of Applied Science, with special reference to engineering, tenable at the Imperial College of Science and Technology—The Academic Registrar, University of London, Senate House, London, W C 1 (March 7)

Lecturer or **Assistant Lecturer in Geography** at the University of Malaya, Singapore—The Secretary, Inter-University Council for Higher Education in the Colonies, 1 Gordon Square, London, W C 1 (March 15)

Scientific Officer (with a good honours degree in chemistry, biochemistry or botany, a sound knowledge of organic chemistry, and a keen interest in the living plant) IN THE BIOCHEMISTRY SECTION for research on the biochemistry and metabolism of the fruit tree—The Secretary, East Malling Research Station, near Maidstone, Kent (March 15)

Lecturer or **Senior Lecturer** (graduate in physics, extensive research experience of solid state physics and preferably of semiconductors) IN THE DEPARTMENT OF APPLIED PHYSICS—The Registrar, College of Technology, Manchester 1 (March 19)

Research Fellow in Electron Physics—The Registrar, The University, Edgbaston, Birmingham (March 26)

Chair of Chemical Technology—The Secretary, The University, Edinburgh (March 28)

Scientific Officer (with a good honours degree and a keen interest in field entomology, and preferably with research experience) IN THE ENTOMOLOGY SECTION for studies on Tortricids and leaf hoppers associated with tree and bush fruits—The Secretary, East Malling Research Station, near Maidstone, Kent (April 15)

I C I Research Fellows in Chemistry, Physics and allied subjects—for example, PHARMACOLOGY, ENGINEERING and METALLURGY—The Registrar, The University, Manchester 13 (April 30)

Biochemical Technician (preferably with experience of manometric techniques or in the isolation of natural products), and a **Technician in the Physical Chemistry Laboratory**, for work particularly concerned with spectroscopic techniques—The Chester Beatty Research Institute (Institute of Cancer Research, Royal Cancer Hospital), Fulham Road, London, S W 3, quoting "Biochemistry" or "Spectroscopy"

Engineers and **Physicists** (with a first- or second-class honours degree or equivalent in physics or engineering) IN THE INSTRUMENTATION SECTION, Royal Aircraft Establishment, Farnborough, Hants, for (*a*) research in techniques and instrumentation for the measurement and recording of physical quantities arising from tests in aircraft and missiles, and (*b*) research on electronic circuits and equipment for flight test, wind tunnel and allied aeronautical research purposes—The Ministry of Labour and National Service, Technical and Scientific Register (K), 26 King Street, London, S W 1, quoting A 13/5A

Experimental Officer (with H S C (science) or equivalent, and a knowledge of physical chemistry, and preferably some metallurgical experience), at the Royal Aircraft Establishment, Farnborough, Hants, for research work on metal extraction processes—The Ministry of Labour and National Service, Technical and Scientific Register (K), 26 King Street, London, S W 1, quoting F 19/5A

Headmaster (graduate in science and experience of the organization and administration of technical schools, and appropriate teaching experience) of a Technical High School at Dacca, Pakistan—The Ministry of Labour and National Service, Almack House, 26–28 King Street, London, S W 1, quoting A.12/PE 74/53

Physicist (with at least H S C (science) or equivalent, and preferably with experience in metallography or in the operation and servicing of electron microscopes) at a Ministry of Supply Research Establishment in South East London, to assist in work involving the application of microscope technique, including electron microscopy, to metallurgical and explosive properties—The Ministry of Labour and National Service, Technical and Scientific Register (K), 26 King Street, London, S W 1, quoting A 8/5A

Postgraduate Studentships in (*a*) **Applied Genetics and Plant Breeding**, and (*b*) **Plant Physiology**—The Secretary, Empire Cotton Growing Corporation, 12 Chantrey House, Eccleston Street, London, S W 1

Research Assistant (with a first-class honours degree in metallurgy, physics or chemistry) for university work on structure of alloys of high melting point—Dr W Hume-Rothery, F R S, Inorganic Chemistry Laboratory, South Parks Road, Oxford

Research Fellow (organic chemist with experience of research, preferably on natural products) IN THE DEPARTMENT OF CHEMISTRY, University College of the West Indies—The Secretary, Inter-University Council for Higher Education in the Colonies, 1 Gordon Square, London, W C 1

Science and Mathematics Master—The Headmaster, Gordonstoun School, Elgin, Morayshire

PERMUTIT

ION EXCHANGE MATERIALS

The use of Permutit Ion Exchange Materials in many roles distinct from water treatment, has resulted in the development of numerous new industrial processes giving improved results and lower running costs. Some materials now available are —

Zeo-Karb Na A sulphonated coal product containing both strong and weak acid groups

Zeo-Karb 215. A nuclear sulphonated phenol resin containing also hydroxyl groups

Zeo-Karb 225. A unifunctional cross linked sulphonated polystyrene resin in bead form of high capacity and exceptional chemical and physical stability

Zeo-Karb 226. A unifunctional cross linked methacrylic acid resin in bead form containing only carboxyl groups as the ion active groups

De-Acidite E. A high capacity anion exchange material of medium basicity

De-Acidite FF A unifunctional very highly basic anion exchange resin in bead form based on cross linked polystyrene and containing quaternary ammonium groups.

De-Acidite G A unifunctional weakly basic anion exchange resin in bead form based on cross linked polystyrene and containing diethylamino groups •

De-Acidite H. A material similar to "De-Acidite G" but containing dimethylamino groups

Bio-Deminrolit. A mixed cation and anion exchange resin for demineralisation in a single column

Decalso F. A synthetic sodium aluminium silicate suitable for the separation and concentration of vitamins and hormones

Decolorite. A resin of high porosity for removing colour from solutions

Permaplex C-10. A highly selective cation exchange resin membrane containing SO_3H groups

Permaplex A-10. A highly selective anion exchange resin membrane containing quaternary ammonium groups.

For full technical information please write to THE PERMUTIT COMPANY LIMITED Head Office and Laboratories Dept V H 92, Permutit House, Gunnersbury Avenue, London, W 4 Telephone CHIswick 6431

Permutit Ion Exchange Materials — Made in Britain by British Labour

MODERN LABORATORIES

. . . individually planned and designed for their particular purposes Over half a century of widespread experience of different types of Laboratories enables us to offer suggestions and designs based on the best of present-day developments

Our Technical Department is always available for free consultation and advice

Some Laboratories recently equipped by us:
Production . . . . J. Lyons & Co. Ltd.
Routine . . . . Express Dairy Co. Ltd.
Research, Routine, etc. . . . Glaxo Laboratories Ltd.
Chemical . . . . . . University College, London

With acknowledgments to Glaxo Laboratories Ltd.

LECTURES AND COURSES

BIRKBECK COLLEGE

(UNIVERSITY OF LONDON)

SESSION 1955-1956 BEGINS MONDAY OCTOBER 3, 1955

Part-time (Evening) Courses provided for Internal Degrees in the Faculties of Arts and Science and for the Academic Postgraduate Diploma in Psychology Facilities also provided for part-time and full-time students reading for higher degrees in arts and science Applications for admission should be made before June 1

Pamphlet and form of application may be obtained from the Registrar, Birkbeck College Malet Street, W C 1

IMPERIAL COLLEGE OF SCIENCE AND TECHNOLOGY

(TECHNICAL OPTICS SECTION)

A course of eight lectures and an accompanying practical course on Thin Film Optics, by Dr W Weinstein, will be given on Tuesdays and Thursdays at 4 30 p m, commencing Tuesday, February 22, 1955 Fee for eight lectures, 2 gns, and for practical course 4 gns

For further details apply to the Registry Imperial College Prince Consort Road S W 7

UNIVERSITY COLLEGE

LONDON

(GOWER STREET, W C 1)

Four lectures by Dr S R Elsden (University of Sheffield) entitled ' Respiratory Mechanism in Bacteria " will be given on Thursdays, February 10, 17, 24, March 3 at 4 45 p m

Admission free, without ticket

E A L GUETERBOCK
Secretary

UNIVERSITY COLLEGE

LONDON

(GOWER STREET W C 1)

Dr E E Snell (University of Texas) will give a Public Lecture entitled " The Relationship of Structure to Catalytic Activities of Vitamin B_6 " on Monday, February 14 at 4 45 p m

Admission free without ticket

E A L GUETERBOCK
Secretary

UNIVERSITY COLLEGE

LONDON

FREE PUBLIC LECTURES, SPRING TERM 1955

Friday, February 18, at 5 30 Professor F Bergel, Attempts at Chemotherapy of Malignant Diseases Monday February 28 March 7, 14 at 4 45, Dr Joseph Needham New Light on Physico-Chemical Aspects of Morphogenesis

Complete list of public lectures from Publications Officer, University College London Gower Street W C 1 (stamped envelope required)

UNIVERSITY OF LONDON

Two lectures on (i) " Psychology and International Relations " and (ii) " Uses and Limitations of the Experimental Method in Social Psychology " will be given by Professor Otto Klineberg (UNESCO) at 5 30 p m on February 14 and 15 at University of London Senate House, W C 1

Admission free without ticket

JAMES HENDERSON,
Academic Registrar

OFFICIAL APPOINTMENTS

The engagement of persons answering these advertisements must be made through a Local Office of the Ministry of Labour or a Scheduled Employment Agency if the applicant is a man aged 18 to 64 inclusive, or a woman aged 18 to 59 inclusive unless he or she, or the employment is excepted from the provisions of the Notification of Vacancies Order, 1952

UNIVERSITY OF MANCHESTER

I C I FELLOWSHIPS

Applications are invited for the above Research Fellowships, founded by Imperial Chemical Industries Ltd tenable in the University and available for research in chemistry, physics and allied subjects—e g pharmacology engineering metallurgy The value of the Fellowships will be within the range of £600 to £900 per annum according to qualifications and experience

Regulations governing the award of the Fellowships may be obtained from the Registrar the University Manchester, 13 to whom applications should be sent not later than April 30 1955

SOUTH PACIFIC COMMISSION

PLANT AND ANIMAL QUARANTINE OFFICER

Applications are invited for the post of Plant and Animal Quarantine Officer with the South Pacific Commission The successful applicant will be appointed for a period from two to three years, and will be stationed at the Commission s headquarters in Noumea New Caledonia The Plant and Animal Quarantine Officer is required to carry out investigations, etc, relating to the control of plant and animal pests, diseases, and weeds in the South Pacific including supervision of a rhinoceros beetle research programme, operation of an information centre and reporting service and improvement of control and protective measures Applicants should have a university degree with good scientific qualifications and mature experience in the field of plant or animal pests or diseases and their control and prevention including quarantine measures Fluency in English and French is very desirable Commencing salary will be determined according to qualifications and experience, but will be not less than £Stg 1 600 plus a post allowance of £Stg 540 (single) or £Stg 901 (married)

Further information obtainable from the Secretary-General, South Pacific Commission, Noumea New Caledonia, to whom applications, supported by a detailed curriculum-vitae should be sent by March 31, 1955

UNIVERSITY OF LONDON

Applications are invited for I C I Research Fellowships in Biochemistry, Chemistry, Chemotherapy, Engineering Metallurgy, Pharmacology Physics or allied subjects tenable from October 1 1955, normally for three years in the first instance Salary not less than £750 per annum, with family allowances and F S S U

Information and application forms can be obtained from the Academic Registrar University of London, Senate House, W C 1 Applications must be received not later than April 16 1955

THE FOOT-AND-MOUTH DISEASE RESEARCH INSTITUTE

Applications are invited for a post of Research Assistant (female) Duties are concerned with research on serology of viruses Qualifications should preferably include B Sc (bacteriology) The post is superannuable and salary in accordance with nationally agreed scales related to age, qualifications and experience These are Assistant Experimental Officer grade (£372 at age 21, rising by eight increments to £540) or Scientific Officer grade (£467 by ten increments to £750)

Applications stating age, qualifications, details of past and present appointments and accompanied by the names of three referees should be addressed to the undersigned immediately

N SMITH,
Secretary

Pirbright,
Surrey

NATIONAL COAL BOARD INVITE APPLICATIONS for the undermentioned superannuable appointments at London Headquarters in the Pneumoconiosis Field Research (a long-term investigation into the incidence of pneumoconiosis among mine workers) Scientific Technical Officers Grade II or III (salary scales £515 by £20 to £735 male and £420 by £16 to £596 female, or £400 by £20 to £560 male and £325 by £16 to £453 female plus London location allowance of £32 10s minimum rising to £50 maximum), according to qualifications and experience Higher national certificate or similar qualification in mathematics is required There are two posts the duties of one include the handling of experimental data and the preparation of sampling schedules and programmes for investigators in the coalfields, and knowledge of mining practices and terminology is an advantage, duties of the other post include the supervision of junior computors and generally assisting with statistical work and a good knowledge of mathematics with extensive experience of statistical computing is required (Reference No TT/911) Scientific Technical Officers Grade IV (scale £2 19s a week at age of 15 rising to £8 10s a week male, and £7 female at age 27 plus London location allowance of 12s 6d a week) Duties are to assist in statistical calculation and analysis General certificate of education in mathematics is required and experience in statistical computing is desirable (Reference No TT/912)—Write giving full particulars (in chronological order) of age education qualifications and experience (with dates) to National Coal Board Establishments (Personnel) Hobart House Grosvenor Place London S W 1, marking envelope with the relevant TT Reference No Original testimonials should not be forwarded Closing date February 12, 1955

COMMONWEALTH of AUSTRALIA

APPOINTMENT NO 360/12 OF RESEARCH OFFICER

The Commonwealth Scientific and Industrial Research Organization invites applications for appointment to a position of Research Officer to the Tracer Elements Section at the University of Melbourne, Carlton This Section collaborates with other research units of the Organization on the application of radioactive tracer techniques and, in addition, undertakes an independent programme of research in aspects of radiochemistry The appointee will be expected to become familiar with all phases of the Section s work and to develop instrumental techniques particularly for the assay of radioisotopes He will also be responsible generally for the Section's electronic equipment Qualifications University honours degree in electrical engineering or science or equivalent qualifications with specialized knowledge of electronics Salary Dependent on qualifications and experience, commencing salary will be determined within the range of Research Officer £A 1 058 to £A 1 412 per annum actual thirteen increments subject to efficiency review at £A 908 and £A 1,064 per annum nominal Salary includes a cost of living adjustment of £A 198 per annum Fare to Australia (including those of wife and family) will be paid The appointment is subject to satisfactory medical examination and the appointee may be granted superannuation privileges

Applications referring to Appointment No 360/12, and stating full name place date and year of birth, marital state nationality present employment particulars of qualifications and experience and of war service, if any, accompanied by copies of not more than four testimonials and the names and addresses of two referees should reach the undersigned not later than March 5 1955

W IVES
Chief Scientific Liaison Officer

Australian Scientific Liaison Office,
Africa House,
Kingsway London, W C 2

NOTTINGHAM AND DISTRICT TECHNICAL COLLEGE

Principal H Baker Ph D, A M I C E, A M I Mech E

Applications are invited for the post of Lecturer in Geology in the Department of Mining Applicants should have a degree or other recognized qualification in geology, together with some practical experience A knowledge of mining geology or special experience in the geology of coal will be an advantage Salary £965 by £25 to £1,065 per annum

Further particulars and form of application may be obtained from the Registrar, Nottingham and District Technical College, Shakespeare Street Nottingham, to whom completed forms should be returned not later than February 15 1955

F STEPHENSON,
Clerk to the Joint Education Committee

McMASTER UNIVERSITY

DEPARTMENT OF PHYSICS

GRADUATE ASSISTANTSHIPS

Applications are invited for part-time teaching and research assistantships in the Department of Physics McMaster University from persons qualified to register in courses leading to the M Sc and Ph D degrees Assistantships normally carry a yearly stipend of $1 450 to $1 850 Assistants are required to devote 10 to 12 hours per week to duties during the academic session (October to April inclusive) and are able to devote full-time to their research during the summer Research is in progress in the following fields Theory of Molecular Spectra F R Britton Atomic Mass Determinations H E Duckworth Cosmic Rays, F Gulbis Beta and Gamma Spectroscopy M W Johns, Microwave Diffraction A B McLay Solid State, H E Petch Theoretical Nuclear Physics M A Preston, Fission Yields and Isotopic Abundances H G Thode

Interested persons should write to Dr H E Duckworth Department of Physics, Hamilton College, McMaster University, Hamilton Ontario Canada

---

UNIVERSITY OF LEEDS

Laboratory Technician in Agricultural Bacteriology required preferably with experience in bacteriology, botany or chemistry also passes in science subjects in leaving certificate examination Salary according to experience on the scale 120s to 174s a week

Apply by letter within ten days of the appearance of this advertisement giving particulars of qualifications and experience also the names of two referees to Professor T L Bywater, Department of Agriculture, The University, Leeds, 2

WOLVERHAMPTON AND
TAFFORDSHIRE TECHNICAL COLLEGE

ipal C L Old, B Sc (Eng), M Sc (Tech)

plications invited for Senior Laboratory tant, Chemistry Section of Department of ied Science Applicants should be not less 25 years of age, have completed or be pt from national service, have had good inial or other laboratory experience, be able ndertake supervision of juniors, maintain atory equipment and control stores Superable post Medical examination Salary and tions Grade IV miscellaneous scales £440 20 per annum

ply by letter to Principal, Wolverhampton Staffordshire Technical College, Wulfruna t, Wolverhampton, giving age, education, fications and experience and two persons to reference may be made

G W R LINES,
Clerk to the Joint Education Committee

NETHERNE HOSPITAL
COULSDON, SURREY

boratory Technician, male or female, required nodern well equipped laboratory Must hold ciateship of the Institute of Medical Labora- Technology or an equivalent qualification ley Council salary scale and conditions of ser- Single accommodation available if required plications, giving full particulars of age, ex- nce and qualifications, together with the s and addresses of two referees, should be arded to the Physician Superintendent as soon ossible

---

COMMONWEALTH AGRICULTURAL BUREAUX
COMMONWEALTH INSTITUTE OF ENTOMOLOGY

plications are invited for an appointment as ologist, whose principal duty will be the mination of phytophagous and predatory of economic importance, but who would enjoy excellent opportunities for general matic work in the Acarina Candidates are it who show evidence of special interest or vement in this field The successful candiwould work in the British Museum (Natural ry) London The salary will be in a scale rises from £530 by annual increments to 0 per annum, with efficiency bars at £855 and 0 There is also a pay supplement that from £25 at £530 to £35 at £900 to £1,500 starting salary will be determined by age, fications and experience Superannuation be provided for under the F S S U

e closing date for applications is April 30 and full details of the appointment and ods of application can be obtained from the tor, Commonwealth Institute of Entomology, ueen's Gate, London, S W 7

UNITED BIRMINGHAM HOSPITALS
IINGHAM AND MIDLAND HOSPITAL WOMEN, SHOWELL GREEN LANE, SPARKHILL, BIRMINGHAM, 11

plications are invited for the post of Tech- i to the Biological Section of the Depart- of Clinical Endocrinology Duties will le routine biological assays and assistance biological research Salary and conditions rvice will be in accordance with Whitley

plications, stating age, qualifications and ex- nce, accompanied by two recent testimonials, d be submitted to the House Governor

---

CTURERS REQUIRED FOR B B C EN- cing Training Department, Evesham which ly equipped with sound and television broad- g apparatus Applicants should possess de- or higher national certificate in electrical en- ring or physics and be capable of training varying from operator to graduate Know- of r f fundamentals and transmission pulse ique, optics, audio frequency engineering or itics an advantage Salary according to fications and experience —Requests for appli- n forms to Engineering Establishment Officer, lcasting House, London, W 1, quoting ref 2N

SEARCH ASSISTANT (B Sc WITH gy or Physiology) required to train in histo- ical and physiological research methods in Neuropsych'atric Research Centre, Cardiff y £450 to £530 conforming to national health e regulations —Applications should be sent ice to the Secretary, Whitchurch and Ely itals Management Committee, Cardiff

---

AUSTRALIAN NATIONAL UNIVERSITY
RESEARCH SCHOOL OF PHYSICAL SCIENCES

M L Oliphant, F R S , Director

The Australian National University invites applications from qualified persons for the following positions on the research staff Each position carries superannuation on the F S S U pattern and a grant for family fares Each permanent position carries a further grant for removal expenses on taking up appointment The University assists new members of staff who are married to obtain houses , rooms are available for unmarried members in University House Annual increments where ranges are provided will be £A 50 Professor of Theoretical Physics Who will be head of the Department of Theoretical Physics, and whose advice will be sought in appointments to the positions named below Salary £A 3 000 per annum Reader in Theoretical Physics Salary within the range £A 2,100 to £A 2,400 per annum Senior Fellow Salary range to be determined within limits £A 1,900 to £A 2,350 per annum Fellow Salary range to be determined within limits £A 1,350 to £A 1 950 per annum Senior Research Fellows Commencing salary within range £A 1,650 to £A 2 100 , tenure three years, with possibility of renewal for further two years Research Fellows Commencing salary within range £A 1,100 to £A 1 650 tenure three years, with possibility of renewal for further two years Study leave entitlement in the case of Professors is one year in four on full pay, with a grant of up to £A 1,000 towards the cost of such leave , Readers one year in six and £A 800 , Senior Fellows one year in six and £A 700 , Fellows one year in seven and £A 500

Full particulars should be obtained from the Secretary Association of Universities of the British Commonwealth, 5 Gordon Square London, W C 1 The closing date for the receipt of applications, in Australia and London, is June 30, 1955

FLINTSHIRE EDUCATION COMMITTEE
FLINTSHIRE TECHNICAL COLLEGE
MATHEMATICS AND PHYSICS SECTION
GRADE B ASSISTANT IN PHYSICS

Applications are invited for the above position The assistant lecturer will be required to advise the Lecturer responsible for the section on matters pertaining to the teaching of physics and will be required to teach physics up to the standard of the university general degree Applicants should have good academic qualifications and appropriate teaching and other experience The salary will be in accordance with the Burnham scale

Forms of application which must be returned as soon as possible, may be obtained from the Director of Education, County Education Offices Mold, on receipt of a stamped addressed envelope Canvassing, either directly or indirectly will disqualify

---

WEIZMANN INSTITUTE OF SCIENCE
REHOVOTH, ISRAEL
CHAIM WEIZMANN MEMORIAL FELLOWSHIPS 1955-56
ESTABLISHED BY YAD CHAIM WEIZMANN

Applications are invited for the above, tenable for the academic year 1955-56, at the Weizmann Institute of Science The work of the Weizmann Institute is mainly devoted to fundamental research in the exact sciences Scientists who have done meritorious post-doctoral research are eligible The stipend consists of $3,000, plus up to $2,000 for fare, depending on distance from Israel Elections will be held in April

Further particulars may be obtained from the Academic Secretary Applications will be accepted up to March 10, 1955

THE IMPERIAL COLLEGE OF SCIENCE and technology invites applications for the following awards to undertake research on the growth of ice crystals A senior award of about £600 per annum, tenable in the Department of Meteorology for not more than three years, is offered to candidates with at least two years' research experience in experimental physics A junior award of about £350 per annum tenable in the Department of Chemical Engineering to graduates with high honours degree will be made for one year in the first instance but renewable for further one or two years Successful applicants will be expected to commence their duties as soon as possible—in any case not later than September 1, 1955 —Applications giving the names of two referees, should reach the Registrar not later than March 1, 1955

UNIVERSITY OF DURHAM
KING'S COLLEGE, NEWCASTLE UPON TYNE
DEPARTMENT OF MATHEMATICS

The Council of King's College invite applications for a Temporary Lectureship in Applied Mathematics The appointment will be for the academic year 1955-56 only and the salary will be determined at a suitable point within the range £650 to £1,350, in accordance with the qualifications and experience of the successful candidate Family allowance and F S S U

Further particulars may be obtained from the undersigned, to whom applications (three copies) together with the names of three referees, should be addressed so as to reach him not later than February 28, 1955

G R HANSON,
Registrar of King's College

UNIVERSITY OF DURHAM
KING'S COLLEGE, NEWCASTLE UPON TYNE
DEPARTMENT OF MATHEMATICS

The Council of King's College invite applications for a Lectureship in Applied Mathematics The commencing salary will be determined at a suitable point on the scale £650 by £50 to £1,350, in accordance with the qualifications and experience of the successful candidate Family allowance and F S S U

Further particulars may be obtained from the undersigned, to whom applications (twelve copies) together with the names of three referees, should be addressed so as to reach him not later than February 28, 1955

G R HANSON,
Registrar of King's College

UNIVERSITY OF LEEDS
DEPARTMENT OF ANAESTHETICS

Applications are invited from candidates trained in physiology and/or biochemistry for appointment as full-time Research Assistant in the Department of Anaesthetics at a salary of £400 a year The appointment is suitable for a science graduate intending to work for a higher degree and will be for one year in the first instance, subject to renewal Laboratory facilities will be provided

Applications (three copies), stating date of birth qualifications and experience, together with the names of two referees should reach the Registrar The University, Leeds, 2 (from whom further particulars may be obtained), not later than March 1, 1955

ROYAL TECHNICAL COLLEGE
SALFORD

Principal P F R Venables, B Sc , Ph D , F R I C

The Governors invite applications for the post of Head of the Chemistry and Applied Chemistry Department, duties to commence as soon as possible The post is recognized as a Grade V Department under the 1954 Burnham Committee Report on Scale of Salaries for Teachers in Establishments for Further Education, the salary being £1,515 by annual increments of £25 to £1,665 Candidates should preferably have teaching, industrial and/or research experience, and be capable of directing the growing amount of postgraduate courses and research in the Department

Forms of application and further particulars may be obtained from the Principal, Royal Technical College, Salford, 5, to whom applications should be returned as soon as possible

R RIBBLESDALE THORNTON
Clerk to the Governors

UNIVERSITY OF LIVERPOOL

Applications are invited for the following posts in the Department of Physics (i) Lecturer (Grade II), for which candidates should have had experience in either experimental or theoretical nuclear physics , (ii) Assistant Lecturer or Lecturer in the Subdepartment of Acoustics , at initial salaries according to age, qualifications and experience within the ranges current at the time of appointment for Lecturers and Assistant Lecturers Both appointments will commence on October 1, 1955

Applications, stating age, academic qualifications and experience, together with the names of three referees, should be received not later than April 14 1955, by the undersigned, from whom further details may be obtained

STANLEY DUMBELL,
Registrar

THE SOCIETY OF CHEMICAL INDUSTRY has a vacancy for an Editorial Assistant with a knowledge of chemistry The appointment is intended to be permanent and progressive and the salary will be related to experience —Applications to the General Secretary, 56 Victoria Street London, S W 1

NORTH OF SCOTLAND COLLEGE OF AGRICULTURE

ASSISTANT LECTURER IN AGRICULTURAL ENGINEERING

Applicants for this post should possess a degree in Engineering and/or in Agriculture with practical experience in Farm Implements and Machinery Salary scale according to age and qualifications on scales ranging from £419 2s to £936 14s per annum Superannuation scheme Applicants will be required to serve a probationary period of two years

Application forms and further particulars obtainable from the Secretary of the College, 41½ Union Street, Aberdeen, with whom applications should be lodged not later than February 16 1955

BOLTON AND DISTRICT HOSPITAL MANAGEMENT COMMITTEE

THE BOLTON ROYAL INFIRMARY
DEPARTMENT OF PATHOLOGY

Applications are invited for the appointment of Biochemist Candidates should hold an appropriate science degree or the A R I C The person appointed will work under the direction of the Principal Biochemist Whitley Council salary scale and conditions of service

Applications, stating age, qualifications, particulars of experience, etc, and the names of two referees, should be sent to the Group Secretary, The Royal Infirmary, Bolton, as soon as possible

LONDON, THE UNIVERSITY

GOLDSMITHS' COLLEGE

Required, Biology Laboratory Technician (man or woman) for work in laboratories covering B Sc (General) degree and Teacher Training Courses Previous experience and Intermediate City and Guilds examination an advantage though not essential Salary at current L C C rates

Apply, stating age, qualifications and experience to the Warden, Goldsmiths' College, New Cross, London, S E 14

UNIVERSITY OF LONDON

Applications are invited for Turner and Newall Research Fellowships in Engineering, Inorganic Chemistry, Physics or an allied subject, tenable from October 1, 1955, normally for three years in the first instance Salary not less than £750 per annum, with family allowances and F S S U

Information and application forms can be obtained from the Academic Registrar, University of London, Senate House, W C 1 Applications must be received not later than April 16, 1955

CHEMICAL ENGINEER REQUIRED BY the National Research Development Corporation to join a team engaged in research connected with the design and development of multimembrane electrodialysis cells and to supervise the construction of semi-technical scale demonstration plant Applicants should be between 24 and 30 years of age and should hold a degree in chemical engineering or physical chemistry with at least two years' postgraduate experience The appointment is tenable at the Low Temperature Research Station, Cambridge, and is for two years in the first instance Initial salary £700 to £900, according to experience The conditions are similar to those attaching to Research Fellowships—Application, giving full details of qualifications, should be made to the Superintendent, Low Temperature Research Station, Downing Street, Cambridge

---

RESEARCH ASSISTANT (MAN) WANTED as soon as possible for university work on structure of alloys of high melting point The position offers good opportunities for learning high temperature methods The work is arranged so that the man appointed qualifies as an advanced student for the Oxford D Phil degree Requirements First-class honours degree in metallurgy physics or chemistry Salary according to qualifications Applications from overseas cannot be considered, and men with second-class honours should not apply unless they have research experience—Applications to Dr W Hume-Rothery, O B E, F R S, Inorganic Chemistry Laboratory, South Parks Road Oxford

---

APPLICATIONS ARE INVITED FROM women holding degree in biology for appointment of Haematological Technician Previous experience in haematology not necessary In first instance appointment will be made in grade of Technician (£450 to £515 per annum) Promotion to the grade of Senior Technician (£540 to £625 per annum) will be made if satisfactory after probationary period of one year Salary and conditions according to Whitley Council—Apply Dr Mills, Royal Berkshire Hospital, Reading

UNIVERSITY OF MALAYA

SINGAPORE

Applications are invited from candidates holding degree in Pharmacy or Fellowship of Pharmaceutical Society for (1) Lectureship or (2) Assistant Lectureship in Pharmaceutics Salary scales (1) £1,148 by £49 to £1,442/£1,540 by £56 to £1,820 per annum (2) £1,001 by £49 to £1,099 per annum, according to qualifications and experience Allowances, expatriation in range £280 to £308 per annum, cost of living in range £210 to £560 per annum All paid in Malayan currency Free passages for appointee, wife and children under 12 years Part-furnished quarters at reasonable rent Provident fund scheme

Applications (six copies), naming three referees and detailing qualifications and experience, to be received by April 15, by Secretary, Inter-University Council for Higher Education in the Colonies, 1 Gordon Square, London, W C 1, from whom further particulars may be obtained

INSTITUTE OF DERMATOLOGY

BRITISH POSTGRADUATE MEDICAL FEDERATION
UNIVERSITY OF LONDON

Applications are invited for the appointment of Biochemist, preferably with hospital experience, who will be required to take charge of a new Subdepartment (at the In-patient Department of St John's Hospital for Diseases of the Skin at Homerton) under the general control of the Director of Pathology Grading and salary according to age, experience and qualifications Candidates must have aptitude and inclination for research having a bearing on Dermatology

Immediate application should be made to the Secretary, Institute of Dermatology, St John's Hospital for Diseases of the Skin, Lisle Street, Leicester Square W C 2, from whom further particulars concerning the appointment can be obtained

KING'S COLLEGE HOSPITAL

DENMARK HILL, S E 5

Applications are invited for the post of Biochemist in the Chemical Pathology Laboratory, which becomes vacant on March 14 The conditions of service are as laid down by the Professional and Technical Council of the Whitley Councils An honours degree in chemistry or an equivalent qualification will be considered an advantage

Applications, in writing, stating age, education and experience, together with the names and addresses of two referees to Professor Gray, Department of Chemical Pathology by February 15, 1955

NOTTINGHAM AND DISTRICT TECHNICAL COLLEGE

Principal H Baker Ph D, A M I C E, A M I Mech E

Applications are invited for the post of Lecturer in Textile Chemistry and Dyeing Applicants should possess a degree or other high qualifications in pure or applied chemistry Experience in the Dyeing or Printing of Textiles will be an advantage, as will also be the ability to initiate and direct research Salary, £965 by £25 to £1,065 per annum

Further particulars and form of application may be obtained from the Registrar, Nottingham and District Technical College, Shakespeare Street, Nottingham, to whom completed forms should be returned not later than February 15 1955

F STEPHENSON,
Clerk to the Joint Education Committee

UNIVERSITY OF ABERDEEN

Senior Technician required for Clinical Chemistry Department, Foresterhill Wage on scale £460 by £20 to £560 placing according to qualifications and experience

Applications in writing to the Secretary, Marischal College

ENGINEER WITH CONSIDERABLE mathematical ability required at Ministry of Supply Experimental Establishment, Christchurch, Hants, for design and testing of mechanical and structural components including strain gauging Should possess first- or second-class honours degree in engineering and be proficient in strength of materials and theory of structures Corporate Membership of Institution of Civil Engineers desirable Salary within Scientific Officer range £467 10s to £845 Women somewhat less F S S U benefits may be available—Application forms from Ministry of Labour and National Service, Technical and Scientific Register (K), 26 King Street London S W 1 Quoting E/30/5/A

READER AND SENIOR LECTURERS OR Lecturers in Physics—The Dean, College of Arts and Science, Baghdad, Iraq

NATIONAL RESEARCH COUN CANADA

Applications are invited for the post of Physiologist in the Division of Applied Bio Ottawa Duties Fundamental research on lems of photosynthesis and related metabc translocation, tissue culture or cell physiolog be carried on independently and in collabor with others Candidates must have at least years' experience beyond the doctorate lev plant physiology, plant biochemistry or cyt (other than cytogenetics) Initial salary wi in the range of $5,750 to $7,000 per annum pending on qualifications and experience, salary increases within this range for satisfa service Superannuation benefits, sick leave annual leave with pay apply, group hospital medical plans are available Duties to comm as soon as possible Applicants should Canadian or British subjects

Apply to the Director, Division of Ap Biology, National Research Council, Ott Ontario, Canada, giving full name, date of marital status, dependants, particulars of e tion, experience and interests, references to p cations, or, preferably, reprints and the n and addresses of three referees having int knowledge of their work

NORTHERN IRELAND HOSPIT AUTHORITY

APPOINTMENT OF NON-MEDICAL BIOCHEMIST

The Authority invite applications for the of Biochemist (non-medical) with duties at Central Laboratory, 51 Lisburn Road, Be The appointment will be in the grade of Scie Officer (Senior Grade) at a salary at the ra £835 by £40 (5) by £25 (1) by £20 (1) to a mum of £1,080 per annum Candidates sh possess an honours science degree of a unive of England, Wales, Scotland or Ireland, or suitable higher degree

Application forms and further particulars be obtained from the Secretary, Northern Ire Hospitals Authority, 44-46 Queen Street, Bel to whom completed applications should be to arrive not later than March 15, 1955

ROTHAMSTED EXPERIMENT STATION

HARPENDEN, HERTS

Chemists required in the Biochemistry De ment, to help in research on the formatio heterocyclic compounds in plants The app ment will be in the grade of Scientific O (£467 to £845) Starting pay according to qualifications experience and period of Nat Service The rates for women are some lower F S S U

Apply in writing to the Secretary, giving particulars and the names and addresses of referees

BRISTOL EDUCATION COMMITTEE

COLLEGE OF TECHNOLOGY

Principal G H Moore, M Sc F P S, F R

Applications invited for post of Head of De ment of Pharmacy as from September 1, Applicants should be graduates in pharmacy hold the Pharmaceutical Chemists' Dipl Salary Grade III Burnham Technical R (£1 215 by £25 to £1,365)

Further particulars and application forn be returned by March 5) from Registrar, C of Technology, Unity Street, Bristol, 1

Chief Education Offic

SCOTTISH MARINE BIOLOGIC ASSOCIATION

SECRETARY AND DIRECTOR

The Council of the Association invite ap tions for appointment to the combined offi Secretary of the Association and Director o Marine Station, Millport, as from April 1,

Particulars may be obtained from, The tary, Marine Station, Millport Isle of Cum Scotland

---

NATIONAL INSTITUTE FOR RESEA in Dairying requires Personal Assistant (fe to Head of Physiology Department Good tarial qualifications essential Degree in logical science or some biological exper would be an advantage, as would some k ledge of foreign languages Commencing according to age in scale £382½ (age 2 £482½ (age 26 or over on entry) to £540 (mum), with superannuation—Applications, names of two referees, to reach Secretary o Institute, Shinfield, Reading, within one Quote reference 55/3

MEDWAY AND GRAVESEND HOSPITAL MANAGEMENT COMMITTEE

RADIOTHERAPY CENTRE
WILLIAM'S HOSPITAL, ROCHESTER, KENT

HOSPITAL PHYSICIST

plications are invited from experienced Hos- Physicists for the post of Physicist, Senior e, to the above new Radiotherapy Centre y grade £835 to £1 080 per annum

ply, stating age, qualifications and experi- with two names for reference, to the Group tary, 20 Star Hill, Rochester, as soon as ble

---

UNIVERSITY OF TORONTO

PARTMENT OF CHEMICAL ENGINEER- ING AND APPLIED CHEMISTRY
CHEMICAL ENGINEER—PHYSICAL CHEMIST

ere is an opening on the professorial staff a chemical engineer well grounded and in- ted in physical chemistry, or a physical ist who has an engineering background arch interests or experience in the field of leum are highly desirable

dress inquiries to R R McLaughlin

CHNICIAN REQUIRED FOR TEACH- aboratory Sound knowledge of routine bio- ical technique essential and preference given older of intermediate I M L T certificate or alent Salary on scale £315 to £450 per m Post permanent and pensionable —Apply g particulars of experience to Administrative er, Department of Biochemistry, South Parks l, Oxford

---

UNG LADY GRADUATE (B A OR B SC) red for post of Cytologist in Tissue Culture ratory Knowledge of tissue culture tech- not essential, training provided Appoint- offers security, with opportunity of a good r Income according to individual initiative position is pensionable —Write giving details ge and education to the Director, Canine arch Station, Kennett, Newmarket, Suffolk

---

BORATORY TECHNICIAN, FULLY ed in physiological techniques, required e in accordance with university scale —Appli- n, in writing with the names of two referees, Administrative Officer, Sir William Dunn ol of Pathology, University of Oxford

---

CHNICIAN REQUIRED, EXPERIENCED iochemistry or chemical pathology —Apply iting to the Dean, St Thomas's Hospital cal School, London, S E 1

PPOINTMENTS VACANT

SECRETARY-LIBRARIAN

ung lady, competent shorthand-typist, red as Secretary to Research Depart- engaged in nutrition research, and also e responsible for the departmental library knowledge of science is essential and some y experience would be an advantage Five- week, starting salary £400 to £500 per m, according to experience

ply in writing, giving age and full details of ous experience, to Research Department, l Limited 148 Old Street E C 1

INFORMATION OFFICER

Applications are invited for the post of formation Officer with an Engineering ompany The responsibilities of the In- rmation Officer will include the organiza- on and operation of a Technical Library, stracting and compilation of biblio- aphies for senior technical staff engaged development and design work

Applicants should hold a science degree d preferably have had previous experience similar work Knowledge of languages advantage

Applications, giving full details of qualifi- tions, experience, age and salary required Box 642, T G Scott and Son, Ltd , 143- 7 Regent Street, London, W 1

TENT AGENTS IN LONDON REQUIRE tant with knowledge of chemistry (preferred) physics or of engineering Previous experi- in patent work would be useful but not tial The profession offers good prospects — y with particulars and salary required to 640 T G Scott and Son, Ltd , 143-147 nt Street, London, W 1

DISTILLERS COMPANY LIMITED

Applications are invited for the following appointments in the Industrial Group of the Company

SENIOR CHEMIST/CHEMICAL ENGINEER to supervise the operation of the Pilot Plant Division of the Research Department of British Industrial Solvents at Hull The Division includes chemists, chemical engineers, several teams of pilot plant operators, draughtsmen and a small workshop Age up to 37/38 years A degree in Chemistry or Chemical Engineering is essential, together with a number of years' experience of pilot plant work

ASSISTANT WORKS CHEMIST to undertake control work in the Company's Industrial Alcohol Distillery at Hull Age up to 26 years A degree in Chemistry or equivalent qualification is required, but similar work experience is not essential

ANALYST aged 30-40 years for analytical work in connection with the manufacture of whisky, its by-products and malt extract Duties will include the supervisior and training of young chemists in this field A degree in Chemistry or equivalent qualification is necessary and appropriate experience in general analytical and bio-assay work is desirable The post is tenable near Stirling in Scotland

Salaries for the above posts would depend on qualifications and experience Apply Staff Manager, The Distillers Co Ltd , 21 St James's Square, London, S W 1 Ref DCL/G2

A PHYSICIST WITH INDUSTRIAL EXPERIENCE of Instrument development is required to join a small team engaged in the design and manufacture of special-purpose apparatus The work is concerned with a wide variety of physical principles and manufacturing techniques A man possessing a general science degree, preferably including chemistry and with practical experience of mechanical and electrical engineering would be suitable The appointment is at the Applicational Research Centre of a Major Oil Company located near Chester Starting salary according to age, qualifications and experience Attractive pension benefits —Write, giving full details experience, qualifications, age, marital status, to Box ZT 705 Deacon's Advertising, 36 Leadenhall Street, London, E C 3

CHIEF CHEMIST REQUIRED BY FIRM specializing in the rare metals to supervise both routine and research laboratories Ph D or equivalent degree with some industrial experience Commencing salary £1,500 per annum Contributory pension scheme —Box 636, T G Scott and Son, Ltd , 143-147 Regent Street, London W 1

BRITISH NYLON SPINNERS, LIMITED The Company's expanding activities will give rise to further appointments, during the next few months, covering a wide field of scientific endeavour Graduate Scientists and Textile Technologists, whether available now or later, are invited to register their interest at this stage, and where necessary exploratory interviews will be arranged involving no obligation The openings will cover a range of work including pure research, applied research plant experimentation and the development of new manufacturing techniques up to full scale operation For men with suitable ability and inclinations there will be opportunities for specializing in the new advanced forms of technology arising with the advent of synthetic fibres and their textile applications Several of the appointments will be at a senior level and the Company will welcome tentative inquiries from chemists, physicists and textile graduates —These will be treated in strict confidence and should be addressed to the Personnel Manager, British Nylon Spinners Limited, Pontypool Mon

---

CHEMIST/PHYSICIST REQUIRED FOR RESEARCH Laboratory to work on interface phenomena in all its aspects We have a wide field of interests including surface area of small particles and fibres, electro kinetic effects, stability of emulsions etc The post is progressive and salary will be commensurate with ability —Full details to Chief Chemist, T B Ford, Ltd , P O Box 1, Snakeley Paper Mill, Loudwater, High Wycombe, Bucks

---

RESEARCH FELLOWSHIP

The Uganda Development Corporation, Limited, invite applications for a Research Fellowship, tenable for three years at the Building Research Station, Watford The successful candidate will be required to undertake fundamental research into problems of cement manufacture involving unusual raw materials, the methods employed being those of high temperature chemical and mineralogical investigation Applicants should be not more than 30 years of age, and should have an honours degree and have specialized in chemistry, physics or mineralogy Some research experience preferred Starting salary £700 to £900, according to experience and qualifications

Applications should be made in writing to J L Leyden, Esq , C B E , London Director, 27 Regent Street, S W 1, from whom further details can be obtained

---

RESEARCH LABORATORIES OF A MAJOR oil company have a vacancy for a first-class electronics engineer The position, which is a new one, involves the establishment of maintenance procedures for modern analytical instruments and the design and application of control instruments for pilot plant, test engines and analytical work Applications for this position are invited from first- or upper second-class honours graduates in physics, chemical or electrical engineering who have had a minimum of five years' experience in the application of electronics to industrial and/or laboratory instrumentation The salary offered will to some extent be dependent on the qualifications of the successful candidate, but it will be at a level commensurate with the responsibilities of the job The position is permanent and pensionable —Write in first instance to Box 643, T G Scott and Son, Ltd , 143-147 Regent Street, London, W 1, giving brief details of education and experience

---

THE ENGLISH ELECTRIC COMPANY INvites applications for the post of Technical Librarian at the Guided Weapons Division, Luton Applicants should hold recognized librarianship qualifications, have some scientific or technological background and have had responsible experience in a technical library Educational qualifications in physics or engineering approximating to a degree standard would be an advantage The salary will be in accordance with qualifications and experience —Applications to Dept C P S , 336-7 Strand, W C 2, quoting Ref 1378

DENIS FERRANTI METERS LIMITED, Bangor, North Wales Attractive vacancies occur in company situated in North Wales coastal town for engineers and physicists to work on interesting development projects Experience on optical devices, electro-magnetic equipment or electronic instrumentation, and degree or higher national certificate desirable A vacancy also exists for an industrial statistician to plan experiments and interpret data obtained in research work Assistance may be given in obtaining accommodation Good prospects in rapidly expanding organization —Applications, in confidence, to Chief Engineer

---

GRADUATE CHEMIST, METALLURGIST or Chemical Engineer required, to deal with problems relating to the installation of electroplating plant and process control Applicants must have completed military service and be willing to travel —Apply Electro-Chemical Engineering Co , Ltd , 161 Queens Road Weybridge Surrey

---

PROGRESSIVE SOUTH AFRICA PHARMAceutical Company requires senior pharmacologist with bacteriological experience —Inquiries and applications to Saphar Laboratories, P O Box 256, Johannesburg Selected applicants will be interviewed in London

---

FISONS PEST CONTROL, LIMITED, CAMbridge, has vacancies in Chemical Division for Chemists to originate and develop new manufacturing processes for organic chemicals Initial salary range £550 to £800 per annum, according to age, qualifications and experience Permanent, progressive positions Good canteen facilities Lodging accommodation available —Write (quoting No 1004), stating age, fullest particulars and salary required, to Personnel Manager, Fisons Pest Control, Ltd , Bourn, Cambridge

---

CHEMISTS AND PHYSICISTS REQUIRED for the preparation and evaluation of luminescent materials for use in a new project Men of graduate standing with relevant experience are needed Salary in accordance with qualifications Location near Northampton —Box 641, T G Scott and Son Ltd 143-147 Regent Street, London, W 1

ENGINEERS and PHYSICISTS

are required by BRITISH TELECOMMUNICATIONS RESEARCH LTD for work on long term research and development projects in the following fields —

(a) Wide-band line communication systems
(b), Wide-band microwave radio systems, including aerials and propagation
(c) Point-to-point television transmission systems
(d) Measuring and testing equipment for the above
(e) Magnetic materials and semiconductors

Attractive posts are offered to qualified engineers with experience in any of the above fields, and further vacancies exist for junior engineers and technical assistants.

The Company operates a superannuation scheme, and offers attractive working conditions with generous holiday and leave arrangements, and good social and recreational facilities.

All applications will be dealt with in confidence and should be addressed to the Director of Research, British Telecommunications Research Ltd , Taplow Court, Taplow, Bucks

MULLARD RESEARCH LABORATORIES

invite applications from Scientists to wor in its Vacuum Physics Laboratory Th posts provide opportunities for physicists physical chemists to carry out original r search in the field of surface effects in hig vacuum

Some of the vacancies are for seni scientists with previous research experien in mass spectrometry, gas-solid sorptic problems, or in some allied field

The work offers considerable individu responsibility and opportunity for origin research, and whenever possible, publication is encouraged

Salaries according to age, experience an qualifications Excellent conditions of employment, including contributory pensio scheme Apply, quoting reference V P I (R), to Mr G A Taylor, Personnel Manager, Mullard Research Laboratories, Cros Oak Lane, Salfords, near Redhill, Surrey

MULLARD RESEARCH LABORATORIES

invite applications for two types of permanent positions in its Vacuum Physics Laboratory In both cases, the work involves research and development in the realm of semi-conductors, solid state physics and photo devices

(a) SENIOR PHYSICISTS to act as Group Leaders with several years of academic or industrial research experience, preferably, but not necessarily, in the above fields

(b) PHYSICISTS with honours degrees, to work in research and development teams—with or without previous experience

In both cases the positions offered are progressive and pensionable, and carry attractive salaries Candidates, free of national service obligations, should apply, quoting reference V P L (J),

to Mr G A Taylor,
Personnel Manager,
Mullard Research Laboratories,
Cross Oak Lane,
Salfords, near Redhill, Surrey

A VACANCY FOR A YOUNG MALE science graduate exists in the laboratories of the Research Association of British Rubber Manufacturers Candidates should possess a pass degree in the physical sciences The person appointed is required to assist in technological investigations in the laboratories and must be prepared to spend time away from the laboratories carrying out investigations in rubber factories The appointment will be initially on the Technical Officer Scale (£475 by £25 to £675), with expectation of promotion to Senior Technical Officer (£600 by £30 to £870) Candidates already having industrial or other experience will be considered appropriately The post would be eminently suitable for someone wishing to familiarize himself with industry and gain experience before taking an executive industrial position —Applications, giving full particulars of age, qualifications and experience, to be sent to the Secretary, RABRM, Shawbury, Shrewsbury, Shropshire

CHIEF CHEMIST WM MOORHOUSE & Sons Ltd Sunglow Model Factory Leeds require Chief Chemist experienced in Preserves or Food Industry, able to take full analytical and quality control Main specialities Jams, marmalades, lemon curd Christmas puddings mincemeat, bottled and canned fruits, jellies This is a senior appointment and carries non-contributory pension —Apply giving full details present appointment past record, salary required etc , to Managing Director All applications treated in strictest confidence

PHARMACEUTICAL RESEARCH CHEMIST A well qualified chemist or pharmacist, experienced in research methods, is required by London firm of manufacturing chemists to carry out interesting research relating to the development of pharmaceutical products Postgraduate research experience would be considered an advantage This is a responsible post, carrying a good salary and there is a pension scheme —Applications will be treated in strictest confidence and should give full details of age, qualifications and experience Please address to Box 637, T G Scott and Son, Ltd , 143-147 Regent Street, London, W 1

QUALIFIED ELECTRICAL ENGINEER OR Physicist required for work on the design and utilization of rubber cables for a wide variety of applications, mainly for power distribution in coal mines, aircraft, ships, etc The position offers good opportunities for further advancement —Apply Box 632, T G Scott and Son, Ltd , 143-147 Regent Street, London, W 1

GRADUATES WITH HONOURS DEgree are required by the BTH Co , Rugby, for research into the physics of light emission from electric discharges and from incandescent surfaces The work will involve radiation measurement and the experimental development of new light sources —Applicants should write to the Director of Research, British Thomson-Houston Co , Ltd , Rugby, giving their age, qualifications and college, quoting reference RH

APLIN AND BARRETT, LTD , REQUIRE A Bacteriologist for their Research Laboratories at Yeovil Applicants should hold a degree in bacteriology and chemistry, and some research experience would be an additional qualification The person appointed would be required to undertake fundamental research in addition to work of a more applied nature Salary according to age, qualifications and experience —Applications should be addressed to The Director of Research, Aplin and Barrett, Ltd , Newton Road, Yeovil, Somerset

APPLICATIONS ARE INVITED FOR SCIENtific Officers for the British Steel Castings Research Association, Broomgrove Lodge, Sheffield, 10 Posts vacant for candidates with either metallurgical or engineering bias to their training Acquaintance with foundry practice a recommendation This Association is building a new experimental station Prospects good for future progress Salary according to qualifications and experience Usual professional qualifications expected

MONKHOUSE AND GLASSCOCK, LTD , Snowsfields, London, S E 1, manufacturers of "Monk and Glass" food products, have a vacancy for a chemist, preferably not more than 30 years of age A good degree and experience with foodstuffs are required The successful candidate will be in immediate charge of control and development work under the Chief Chemist The initial salary will depend on qualifications and experience There is a staff pension scheme —Applications, giving full details of career, etc should be addressed to the Chief Chemist

ANALYTICAL CHEMIST REQUIRED firm of manufacturing chemists for the contr quality of pharmaceutical products and their materials and for the development of analy processes for the standardization of new prod Well equipped laboratory in N W Lon Commencing salary £750 to £800 Contribu pension scheme —Please address applicat which should state age, qualifications, experi etc to Box 633 T G Scott and Son, Ltd , 147 Regent Street London, W 1

DEVELOPMENT ENGINEERS MARCO Wireless Telegraph Co Ltd , Chelmsford, the following appointments to the perma technical staff of the Company These are paid responsible positions suitable for applic possessing design and development experienc the following fields

Ref 2120 AIRCRAFT AERIALS Expe mental design and development of H and V H F Aerials Systems Applica should have had some experience in t field and preferably be familiar with sm scale model techniques

Ref 2130 RADIO LINKS Appointme are in connection with the development U H F and S H F Wideband Multichan systems Especially suitable for applica with a knowledge of travelling wave tub and centimetric techniques

Ref 2140 MARINE COMMUNICATIO AND RADAR Appointments availa in connection with the development marine transmitters, receivers, navigatio aids and associated equipment

Ref 2220 T V EQUIPMENT Vacanc exist in connection with the development cameras, studio equipment, transmitters a associated apparatus

Ref 2240 V H F MOBILE EQUIPMEN Appointments available in connection w the design of mobile transmitters, receiv and associated power supplies

All appointments are in connection with th pansion of activities in the Company and excellent career prospects for applicants wh able to make an immediate contribution to work of the Groups Please write giving details of qualifications and experience quoting ref SA 55A and appropriate refe number, to Dept C P S 336/7 Strand, W

PHYSICAL CHEMIST (OR PHYSIC with knowledge of analytical methods) to charge of Works Control Laboratory in Hert shire, graduate preferred Initial salary app mately £1 000 per annum (according to qual tions for post) Excellent prospects Pension profits participation schemes —Write full d age qualifications experience to date, to P C Box No 8282, c/o Charles Barker and Ltd , 31 Budge Row London, E C 4

TECHNICAL DEVELOPMENT

Opportunities exist for graduates to enter n expanding and interesting field of work

Appointments are to be made in both enior and intermediate capacity on the staff f a Development Group engaged on proects entailing a special knowledge of and iterest in thermodynamics and physical iemistry

Applications are invited from

1 Graduates with a good science degree and at least four years' research or development experience and being within the age group 27-35 Commencing salary from £1,000 per annum, according to experience and ability

2 Graduates with a good science degree and within the age group 21-26 Previous experience is not essential and graduates due to complete their National Service within the next twelve months are also invited to apply Commencing salary from £650 per annum

Applications should be addressed to Box 9, T G Scott and Son Ltd, 143-147 egent Street, London, W 1, and give llest possible information of qualifications d experience

SIERY AND ALLIED TRADES RESEARCH ASSOCIATION

plications are invited for the post of Librar- Applicants should possess a good scientific technical training and should for preference a science degree A knowledge of library nization and abstracting will be an advantage ications will be considered from either men omen The initial salary in accordance with fications will be not less than £500 per n

rther details and forms of application can be ned from the Secretary, Thorneywood House rst Avenue Sherwood Rise Nottingham pleted forms should be returned not later February 28, 1955

ITISH CELLOPHANE, LTD BRIDG-, Somerset, invites applications for the folg posts Research Chemist Male graduate, 20 to 40 The post is concerned with the ion of compounds for milling and calanderf polymers for plastic films Please quote No R37 N Research Physicist Male ate, age 20 to 40 The duties involved will poratory experimental work on the properties ises of packaging films Please quote Ref R38 N There is a contributory pension scheme—Five-day week—Applications l be addressed to the Personnel Officer, statialifications experience and salary required, uoting appropriate reference number

---

ADING OIL COMPANY HAVE cy for Chemist in their Head Office Applishould be in possession of degree or equi-, and if possible wide experience in the eum industry Work to cover lubricants, ts, bitumens, fuels, etc Age 30 to 35 Salary according to age and qualifications plicants should apply giving full particulars alifications and experience, quoting H 3115, x 7267 c/o 191 Gresham House E C 2

NAGERIAL POSITION OFFERED IN . to Chemical Engineer with several years' rial experience in natural products extrac- Must be able to develop and maintain services and control labour Salary accord- qualifications and experience, home leave, n and bonus schemes—Applications in confidence to Box JA/148, c/o 95 Bishops-E C 2

ASSHOUSE CROPS RESEARCH INSTI- quire a Soil Microbiologist Good honours essential Appointment is Senior Scien-Officer or Scientific Officer grade, according e, qualifications and experience Salary (men) Senior Scientific Officer, £970 to , Scientific Officer, £467 to £845 Women's somewhat lower Superannuation under U—Applications with names of two s, should be sent to the Secretary, Glass-Crops Research Institute, Worthing Road, gton Littlehampton

---

OY CHEMIST, GRADUATE OR H N C, d for analysis of electroplating and allied ns—Apply, Electro-Chemical Engineering td, 161 Queens Road, Weybridge, Surrey

---

DISTILLERS COMPANY LIMITED

The Research and Development Department of the Company have a vacancy for a Mathematician aged 22-26 years for work on a variety of problems concerned largely with instrumentation and physical methods for the study of high polymers Honours degree in mathematics essential, together with some general knowledge of physics, including electronics Salary would depend on qualifications and experience—Apply Staff Manager, The Distillers Co Ltd, 21 St James's Square, London, S W 1 Ref Res 155

MATHEMATICIANS ARE OFFERED good prospects in the Aircraft Industry

SHORT BROTHERS AND HARLAND LIMITED, have vacancies for honours graduates in mathematics in the Analytical Section of the Research Group for initial project and analytical work related to guided weapon and navigation projects, gyroscopic systems, analogue computors, servos and aircraft control development

Experience in industry, the Technical Branches of the Service or in the Scientific Civil Service is essential Adequate experience would serve to make a pass degree acceptable

Assistance with housing and with removal expenses

The amenities normal in large and progressive companies are available

Applications giving relevant details to

Staff Appointment Officer, P O Box No 241, Belfast, quoting reference S A 28

PHYSICIST/ENGINEER OR ENGINEER/Physicist aged between 30 and 40 required to act as Assistant to the Head of the Research Department of a light engineering company with its headquarters in South London Ample modern technical resources are available and the company spends large sums on research and development work Applicants should possess a good degree, a sound engineering background and experience both of controlling a scientific staff and of winning their confidence Starting salary will not be less than £1,200 per annum and a contributory pension scheme is operated—Applications, which will be treated in strict confidence, should contain details of age, experience, qualifications and present salary, and be addressed to Box 808, c/o J G King and Son 150 Fleet Street, London, E C 4

FOOD CHEMIST REQUIRED TO HEAD the analytical laboratory of a London factory manufacturing biscuits, wafers and chocolate A really practical man is sought, keen to see his work intimately linked to production Applicants should have experience in cereal chemistry or chocolate manufacture in addition to a sound knowledge of food analysis Commencing salary is £1,000 per annum and the prospects are excellent Contributory pension scheme, five-day week—Reply with full details of academic and industrial background, to Box N 821, c/o 191 Gresham House E C 2

STATISTICIAN REQUIRED FOR OPERAtional Research into production control problems of a large steelworks in the Sheffield area The work involves variance analysis, etc, of machine behaviour, set in the study of stochastic processes of flow A knowledge of queue theory is desired and the ability to handle time series including auto-correlation The applicant should be interested in the Monte Carlo treatment of synthetic data and in such economic developments as game theory, activity analysis, and linear programming He/she will probably hold or be about to gain a degree in mathematical statistics, and should apply in fullest detail (referring to breadth of interests and stating salary expected) to the Production Control Officer, Box 629, T G Scott and Son Ltd, 143-147 Regent Street, London, W 1

AN ORGANIC CHEMIST IS REQUIRED BY British Schering Manufacturing Laboratories Ltd, Hazel Grove, Cheshire, to take charge of a small Development Laboratory The position would suit a university graduate with two or three years industrial experience A salary of not less than £700 per annum will be paid, according to qualifications and experience

---

GRADUATE CHEMIST

required for work on Power Cables Experience in the field of Plastics would be a distinct advantage Salary fully commensurate with qualifications and experience Applications, giving full particulars of qualifications and experience to Employment Manager, Messrs Johnson and Phillips Limited, Victoria Works, Charlton, S E 7

UNICAM INSTRUMENTS, LTD

Applications are invited from electronic engineers for positions in the development and inspection departments of Unicam Instruments of Cambridge This company is engaged in the manufacture of important instruments, combining original optical and electronic design, which are much in demand for academic and industrial research and process control the world over Good salaries according to qualifications will be paid—Applicants should send full details of age, education and experience to the Personnel Manager Unicam Instruments Ltd, Arbury Works Cambridge

---

THE INDIAN TEA ASSOCIATION REquire two Agricultural Advisory Officers for their Experimental Station in Assam and subsequent location in the tea districts Candidates for appointment must have good degrees in agriculture or good honours degrees in pure science (Undergraduates in their final academic year may apply, any appointment made being in this case, conditional on success in the final examinations) Preference will be given to candidates who can provide evidence of suitable postgraduate training or experience in agriculture but candidates without such experience will be considered if other qualifications are of the appropriate character and standard The successful applicant may be required at the option of the Association, either first to undertake one year's postgraduate training in the United Kingdom at the expense of the Association, or to proceed to India immediately on appointment An officer proceeding to India immediately on appointment may be required, at the option of the Association, to undertake one year's postgraduate training in the United Kingdom at the expense of the Association either during or at the end of the first agreement, which will be for three years The salary scale on appointment will be Rs 900 (£67 10s) per month, rising by annual increments to Rs 2,300 (£172 10s) per month after 21 years' service In addition, servants, car, entertainment and cost of living allowances amounting to Rs 600 (£45) per month for single men and Rs 850 (£63 15s) per month married men are given, with free partially furnished bungalow accommodation There is a provident fund and pension scheme Leave of seven months after the first three years' service and of four months every two years thereafter is granted on full pay and allowances (excluding car and entertainment allowances) and with passages to the U K—Applications, giving full details of academic career and three testimonials, should be sent to the Secretary, Indian Tea Association (London), 39, Lombard Street, London, E C 3, not later than February 28, 1955

JOSEPH LUCAS, LIMITED, HAVE AN INteresting vacancy in their research and development laboratories which would be suitable for a young graduate with honours degree in mathematics or physics The work is largely of a fundamental nature and is concerned with acoustics and mechanical vibrations Previous industrial experience is not necessary—Please reply giving qualifications, age, and any other relevant details, to Personnel Manager, Joseph Lucas (Electrical), Ltd, Great King Street, Birmingham, quoting reference PM/D/59

AFRICAN EXPLOSIVES AND CHEMICAL Industries Limited, South Africa, has a limited number of vacancies in its Research Department near Johannesburg for Physical Chemists who have recently graduated with at least honours degree Remuneration will depend upon qualifications—Inquiries should be addressed to Mr R A Webb, African Explosives and Chemical Industries Limited, Imperial Chemical House, Millbank, London S W 1

QUALIFIED CHEMIST REQUIRED AGED 23 to 30 for engineering works in North-West London Interesting post for man with experimental outlook Superannuation B Sc or similar degree necessary—Reply with full details of age, experience, and salary required to Box 635, T G Scott and Son, Ltd, 143-147 Regent Street, London, W 1

Advertisers please note You must add "Apply Employment Exchange" unless the employment advertised or the workers required are excepted under the Notification of Vacancies Order

MONSANTO CHEMICALS LIMITED REquire a Technician for electronic instrument development at the Nickell Laboratories, Ruabon Applications are invited from physicists, physical chemists or electrical engineers with experience in this field The work will be concerned with the development of new control and measuring devices for both research and production departments —Full details of age, education, training and experience should be sent to the Chief Personnel Officer, Monsanto Chemicals Limited, 8 Waterloo Place, London, S W 1

E M I ENGINEERING DEVELOPment Ltd, have a vacancy for an Assistant Librarian required in Technical Library at Hayes Not under 22 Educated up to Inter B Sc standard in physics and chemistry, and preferably having previous library experience, including cataloguing and indexing —Applicants should send full details to the Personnel Dept (ED/191), E M I Eng Dev Ltd, Hayes, Middlesex

RESEARCH CHEMIST, MALE, REQUIRED for physicochemical problems associated with fruit juices Candidates should be recent graduates or hold qualifications of a professional body and have had practical experience Must be prepared to live in small country town in Gloucestershire —Apply Personnel Manager, Box 631, T G Scott and Son, Ltd, 143-147 Regent Street, London, W 1

YOUNG GRADUATE IN CHEMISTRY with physical or engineering bias required for research and development of new ceramic materials and technical control of production This is a new and interesting field offering good prospects Commencing salary in the order of £500 to £600 per annum, or more according to merit —Apply in writing to Neosid Ltd, Stonehills House, Welwyn Garden City, Herts

FOR SALE AND WANTED

CORNEAL AND CONTACT LENSES EASY payments arranged if desired —For details and free booklet write David Blackstone, Ltd, Dept 235, Triumph House, 189 Regent Street, London, W 1 Tel Regent 3516-7 Consulting Rooms in Leeds, York, Leicester, Middlesbrough Newcastle etc

FOR SALE CAMBRIDGE BENCH *p*H Potentiometer complete with accumulators and electrodes for *p*H 0-14 —Box 638, T G Scott and Son, Ltd, 143-147 Regent Street, London W 1

GRANTS & SCHOLARSHIPS

BEIT MEMORIAL FELLOWSHIPS FOR MEDICAL RESEARCH

Notice is hereby given that an election of Junior Fellows to begin work on October 1 next will take place in May, 1955 Junior Fellowships have successive annual values of £800, £850 and £900, for three years As a rule, superannuation benefits are provided, to which the successful candidates will be required to contribute 5 per cent of the annual stipend and to which the Trust will make a contribution of 10 per cent Candidates must have taken a degree in a faculty of a university approved by the Trustees in Her Majesty's dominions, Protectorates and Mandated Territories, India, Pakistan and the Republic of Ireland, or a medical diploma registrable in the United Kingdom Elections to Junior Fellowships are rarely made above the age of 35 years Applications from candidates must be received not later than April 1 Candidates must submit evidence that they can be given accommodation in the departments where they propose to work, which must be either in Great Britain or Ireland

Forms of application and all information may be obtained by letter only, addressed to the Secretary Beit Memorial Fellowships for Medical Research, The Lister Institute, Chelsea Bridge Road, London, S W 1 For overseas candidates forms of application may be obtained from the Secretary, South African Medical Council, P O Box 205, Pretoria, South Africa, the Director, Commonwealth Office of Education, Box 3879, Sydney, Australia, the Department of Health, Wellington, New Zealand, and the Canadian Medical Association, 184 College Street, Toronto, Canada

SALTERS' INSTITUTE OF INDUSTRIAL CHEMISTRY

SCHOLARSHIPS

Applications are invited for Salters' Scholarships, value £350 to £500 per annum (plus university fees), according to circumstances, for a graduate resident in the United Kingdom with an honours degree in chemistry, biochemistry, physics or engineering, for the purpose of receiving either full-time instruction in the principles of chemical engineering or further experience by research in chemistry or chemical engineering in order to be better qualified to enter chemical industry The Scholarships will be tenable for one year

Applications should be received by the Clerk of the Salters' Company, 36 Portland Place London, W 1, by March 31, 1955 Applications may also be made at any time during the year, but any such late applications will only receive consideration if there are vacancies Applications may be made before graduation Forms of application may be had on request

THE Newton

LONG WORKING DISTANCE ATTACHMENT

provides a working distance of 12 8 mm between object glass and specimen when fitted to a standard microscope in conjunction with a conventional 4 or 8 mm objective

A further important feature is that the use of this attachment eliminates image reversal and thus further facilitates examination and manipulation of specimens.

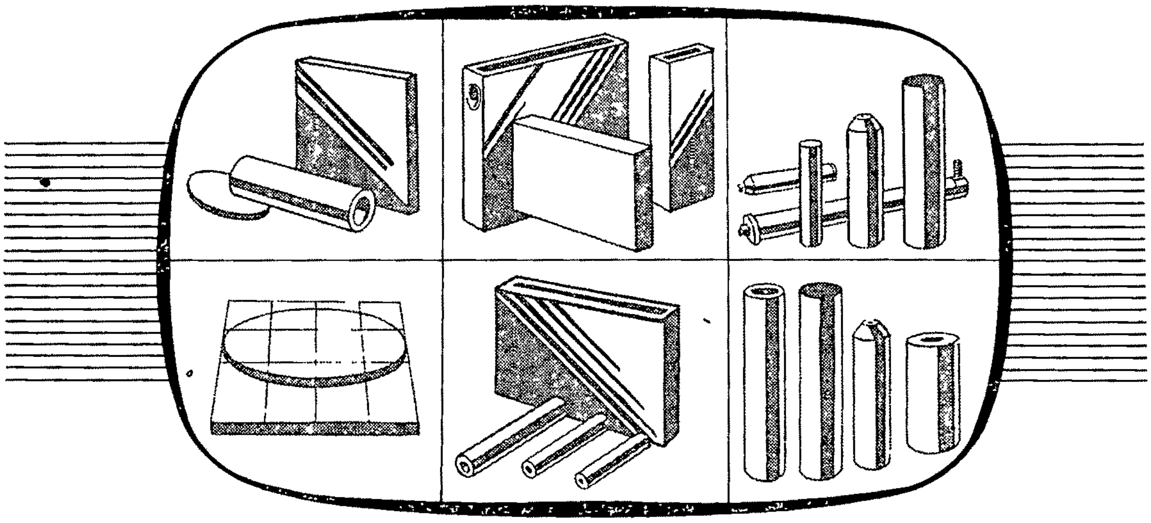
"Leaders in a Specialised Field"



The unique position occupied by Aerox Limited in the world of industrial ceramics is due to specialisation This company was founded essentially to manufacture and develop certain types of ceramic material to meet the needs of a growing complexity of industrial requirements

Although classed generically as "Porsilex", "Celloton", or "CorAlith" Porous Ceramic Media, many grades of material of different types and characteristics exist to meet the vast range of uses in air, gas and liquid filtration, diffusion, aeration and electrolytic separation encountered in modern plant, CorAlith being specially developed for maximum resistance to thermal shock

Complete Aerox Filter equipment is also available for air, gas and liquids up to pressures of 5,000 p s i

* In addition, Aerox Limited are sole world selling agents for Petrox Chemical Stoneware

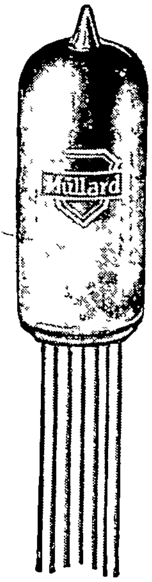
High Performance VOLTAGE STABILISERS and REFERENCE TUBES

Close tolerance burning voltages
Wide range of operating temperature
Good stability over life
Freedom from output voltage "jumps"
Long operating life

NOW ALSO AVAILABLE IN SPECIAL QUALITY RANGE



The high performance of Mullard stabilisers has been improved even further by the introduction of *Special Quality* types, which will operate satisfactorily under rigorous conditions of shock and vibration. These special versions of normal production types combine extra-rugged construction with what has proved to be an inherently reliable principle of design, and they will be available in addition to the normal range.

Samples selected from every production batch of *Special Quality* tubes are tested against Services' specifications to withstand impacts of 500g and vibration of 6g at 175 c/s.

All three of the *Special Quality* tubes can be supplied with either pin or flying lead bases. Your enquiries for further details of these and other stabilisers in the Mullard range are welcomed at the address below.

Special Quality Type No		Electrical Equivalent		Burning Voltage (V)	Current Range (mA)	Maximum Ignition Voltage (V)

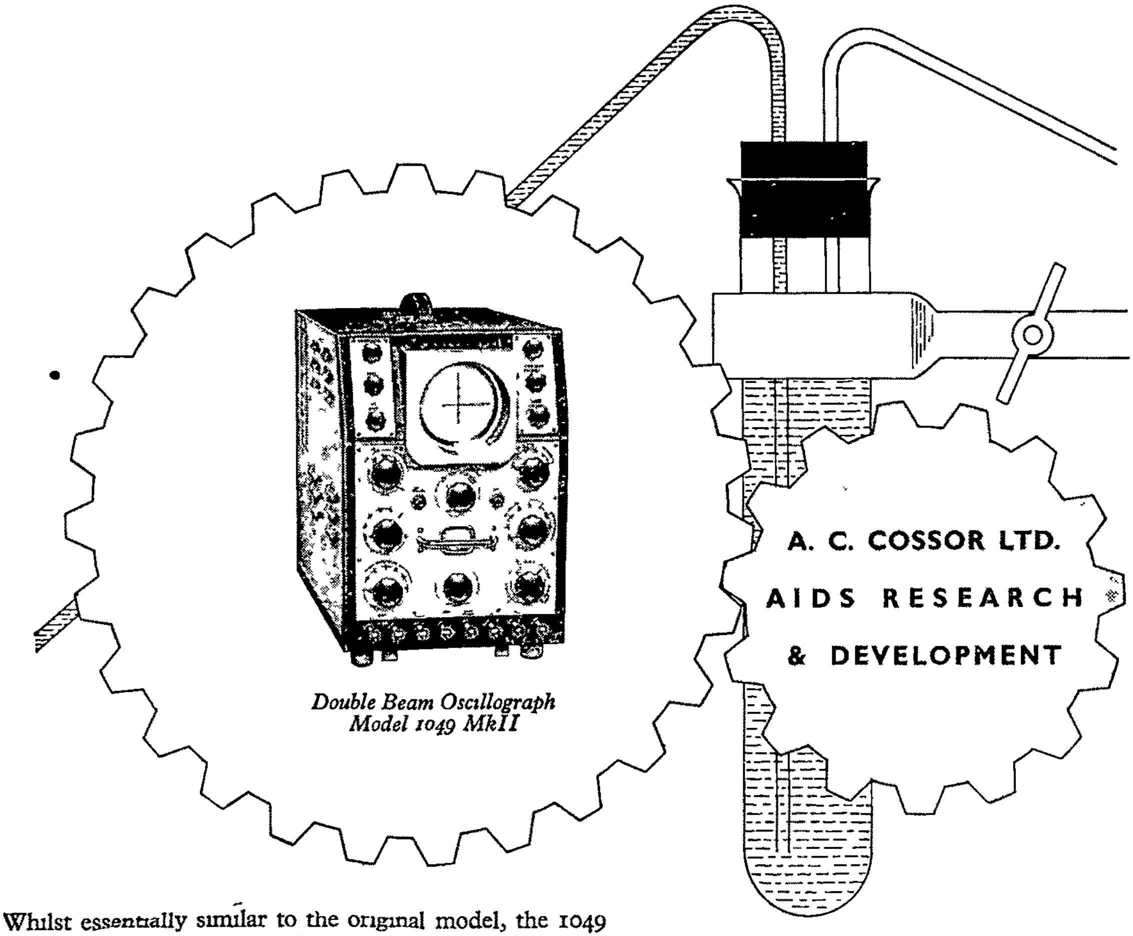
MVT 170



Double Beam Oscillograph
Model 1049 MkII

Whilst essentially similar to the original model, the 1049 Mk. II provides added reliability against high voltage breakdown by the use of a sealed, oil-filled E.H.T. power transformer. The instrument meets the requirements of Industry and the Research fields of Physics and Medicine by providing an oscillograph for the display and measurement of phenomena of zero or very low frequency and those where amplifier bandwidths of up to 100 Kc/s are required. The oscillograph incorporates the Cossor 4″ flat-screen Double Beam tube (type 89) operating at 2 Kv but provision is made for operation at 4 Kv when maximum spot brightness is required. The amplifier circuits are direct-coupled throughout and provide independent amplifying channels for the Y1 and Y2 Beams with a gain of 900 and 25 respectively from zero frequency to 100 Kc/s. Input signal voltages and frequency may be measured on either channel using the calibrated dials and special anti-parallax graticule. The direct-coupled Time Base is arranged to provide a repetitive or triggered scan with a time range of 1.5 seconds to 150 micro-seconds and can be synchronized from a pulse derived either from the internal wor circuits or from an external source. A continuously variable control adjusts the amplitud of the sync. or trigger signal and selects th polarity of the pulse from which synchronizatio is desired. "Z" modulation system is incorporated for time-marking purposes. Stabilization against mains variations up to 10% i provided for amplifiers and cathode ray tub supplies. Long period stability is reached withi 5-10 minutes of switching on. A pre-amplifie (Model 1434) and photographic recording equip ment is available for this oscillograph.

The Technical Advisory Staff of the Cossor Instrument Division is always at your service.

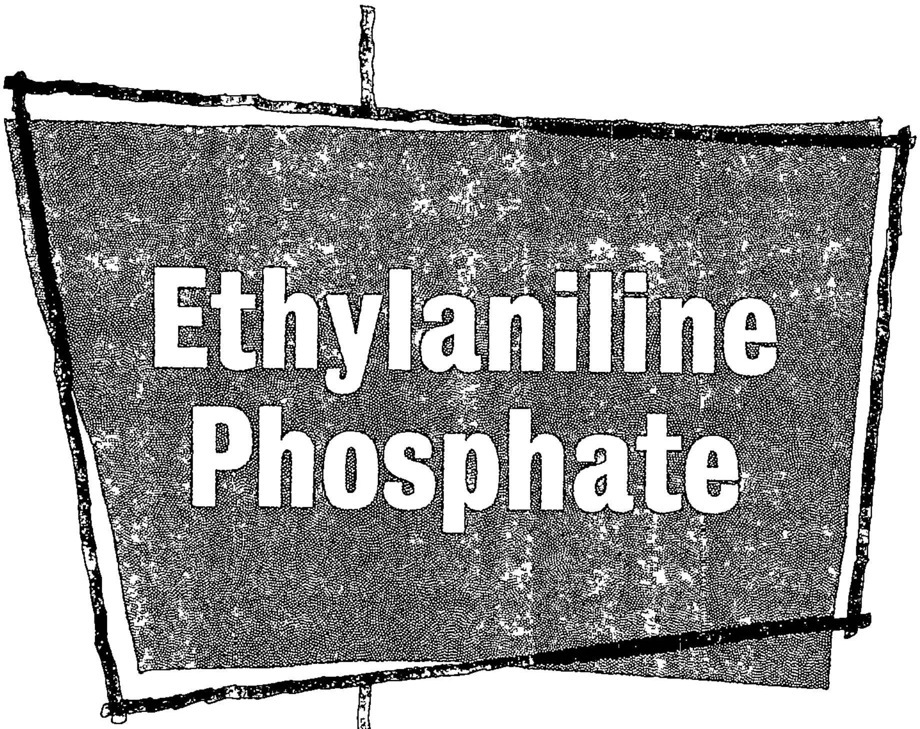
C16



Ethylaniline Phosphate is one of a series of organic phosphates now being produced by Albright & Wilson Ltd. It is a white crystalline substance soluble in alcohol and having a composition corresponding to the formula $2(C_6H_5.\ N(C_2H_5)_2)\ 3H_3PO_4$.

It is used to prevent shellac varnish and French polish stored in tinned iron containers from attacking the iron and giving rise to a darkening of the varnish or polish. The addition of 0·5% by weight of ethylaniline phosphate forms a protective phosphate coating on the metal surface and prevents any reaction between the container and contents

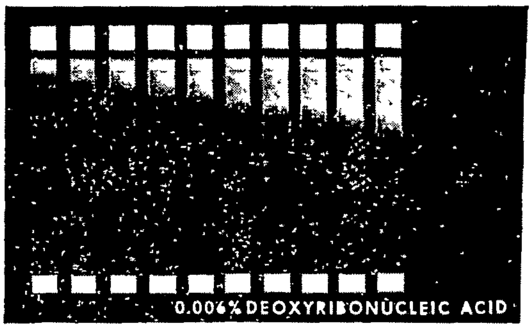
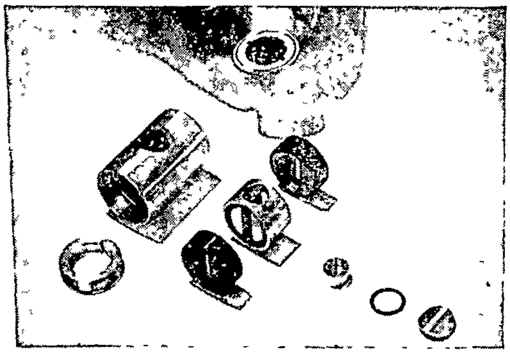
RAYLEIGH INTERFERENCE FRINGES provide high-sensitivity measurement of solute concentration at any level in analytical cell Used for determining molecular weights—both high and low—by the equilibrium method, as well as for measuring sedimentation velocity by the centrifugal transport of material past a given level in the cell

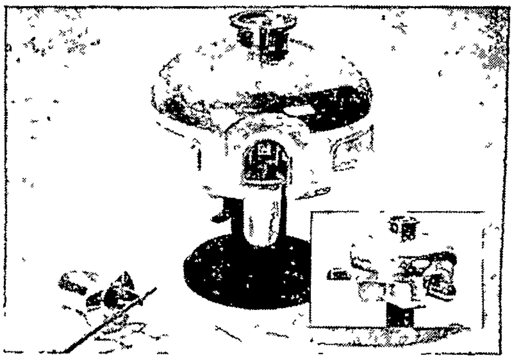


ULTRAVIOLET ABSORPTION method gives very high sensitivity with respect to concentration rather than concentration gradient, as in schlieren techniques Newly-designed optical system is particularly valuable for such materials as nucleoproteins and other ultraviolet-absorbing substances exhibiting diffuse or inhomogeneous boundaries

HOW new developments have increased the versatility of Analytical Ultracentrifugation



SYNTHETIC-BOUNDARY cell permits establishment of an immediately-measurable boundary by a layering technique This extends sedimentation-rate measurements from the previous practical lower molecular-weight limit of 10,000, downward to 500



40,000 rpm SWINGING BUCKET rotors make preparative operations most closely comparable with analytical, give most accurate estimation of sedimentation by sampling Boundaries sediment normally and undergo minimum reorientation Quartz inserts permit spectrography

Since 1947, when it was introduced, the Spinco Model E Analytical Ultracentrifuge has been constantly broadened in utility by new developments in equipment and technique.

Besides the specific items illustrated above, provisions have been made for (1) simultaneous analysis of two materials in the same rotor, (2) temperature measurement and continuous, automatic control of operating rotors to better than 0 1 degree C from zero to 100 degrees C, and many other specialized functions

Each of these developments has been engineered to permit its application to any Spinco Model E in existence Your inquiry is invited for further information on these or other developments which may provide solutions to your problems in physical research

Purer than the driven snow!

Ask T. B. Ford for the answer to any filtration problem, and a perfectly pure and lucid filtrate is yours. Ford's are experts in filtration. They make filtration media for every type of filter—and the standard of efficiency is unsurpassed.

From Ford's, you can obtain filtration media so efficient that they can be used to remove contaminating bacteria and moulds, thus sterilizing the liquids passed through them. This thorough filtration is achieved by the careful, precise admixture of asbestos fibres and cellulose, providing a mat that retains a high degree of porosity and permits a high rate of flow. Ford's Sterimats and Claraid not only filter but adsorb any micro-organisms that would spoil an otherwise stable, immaculate, crystal-clear filtrate.

Twenty years of continuous laboratory research and experiment have made T. B. Ford Ltd. *the* authority on every aspect of filtration media. And they make the best in the world.

This laboratory service is filtration NEWS!

Ford's provide a laboratory service, staffed by a team of experts, which is available to all manufacturers, free of charge. Some manufacturers, with their own fully-equipped laboratories, simply want Ford's to check and confirm their own research findings. Others call upon Ford's to solve some particular problem in their filtration process, whether directly concerned with the media itself or not. Whatever the problem, Ford's will gladly undertake the necessary laboratory research. Write to T. B. Ford Ltd., Laboratory Service, 101 High Holborn, London, W.C.1

CO-OPERATION AND DEVELOPMENT IN SOUTH-EAST ASIA

IN the debate on December 3 in the House of Commons dealing with Colonial development and related matters, there were some interesting references to the progress of the Colombo Plan for the economic advancement of South-East Asian countries The information given on that occasion is amplified by the report for 1953–54 by the Council for Technical Co-operation in South and South-East Asia* and by the third annual report of the Consultative Committee on Economic Development in South and South-East Asia, which has since been published† The former shows clearly how technical co-operation has widened its scope Not only are all countries of the area participants in the scheme and, except Thailand, the Philippines and Laos, full members of the Council, but also technical co-operation has become more closely related to capital aid and to actual needs and priorities established by the Asian countries in their national development plans There is now a tendency towards operations involving all three forms of technical co-operation—experts, trainees and equipment—along with capital aid, and disconnected operations are replaced by co-ordinated and continuous operations with one project serving as a link in the chain of planned development.

With these two trends has been an approach to a better balance between the training of the countries' nationals at home and abroad The flow of trainees abroad has not diminished, but it is now apt to be concentrated on higher training Mutual technical co-operation among the countries of the area has also developed, and the report cites examples of the exchange of experts and the offer of training facilities in institutes or on development projects to countries about to embark on similar projects The expansion of technical assistance has also made more urgent the need for co-operation among the numerous agencies working in this field

Up to June 30, 1954, about £2 million had been expended under the Scheme against appropriations of £8 million, and a further £2 million was committed This compares with more than £1,000 million already spent on economic development programmes, but the report points out that it is not easy to assess the impact of technical assistance Such co-operation is usually applied at strategic points of the economy, and often the expert is a catalyst of the whole economy Nevertheless, there seems to be little doubt as to the real contribution which most of the individual technical aid projects have made to the national economic development plans, though the report fully recognizes that there is always room for improvement.

Among the current difficulties on which some stress is laid are the determination of priorities and the timing of projects. There are also difficulties in the selection of trainees and of equipment, and in finding the right expert for the job Posts of professors at universities and technical institutes are hard to fill, for example, and it is difficult to recruit some types of engineers and technicians There is an increasing demand for experts to undertake executive responsibilities as well as offer technical advice. It is suggested that more use could be made of firms of consultants, and that better use could be made of the equipment provided if it could be associated with the work of experts in the field, or of trained men returning from studies abroad

These difficulties are fully appreciated in the report on the Colombo Plan as a whole which the Consultative Committee has issued since its meeting at Ottawa in October, at which Thailand, Japan and the Philippines were admitted as full members of the Plan. The chapter of that report which deals with technical assistance does not indeed go into such detail, but it sets its progress against the broad background of the other technical co-operation schemes operating in the area, under which nearly 5,000 places in all have been provided for technical training and some 2,500 experts and technicians have been sent to put their skill at the service of the countries concerned Even so, the progress of the Technical Assistance Programme, which manifestly is increasingly appreciated by the Asian members, stands out, with the increase of 27 per cent in total development expenditures throughout the area—a figure expected to increase by 31 per cent in the current year—as perhaps the two most satisfactory features of the report

The full impact of the development programme, like that of the Technical Assistance Programme, will not be felt for some time, in view of the long-term character of many of the projects Indeed, the value of the technical assistance programme cannot be measured adequately either in monetary or statistical terms, but it has clearly played a vital part in the economic progress recorded in this report, and the Technical Co-operation Bureau which has been established at Colombo during the past year, in accordance with a recommendation at the New Delhi meeting in October 1953, to establish direct channels of correspondence with information units of member countries, to collate and distribute information and to constitute a central pool of information in the Colombo Plan, should undoubtedly facilitate that process Meanwhile, without under-rating the magnitude of what still remains to be done, it can be said that the decision to embark on far-reaching and comprehensive programmes of economic development was both courageous and right

Co-operation between the member countries is now taken for granted, and while the financial problems of the Colombo Plan countries, relative to the needs of development, are most serious and the gap between estimated costs of development programmes and foreseeable available financial resources is widening rather than narrowing, the growing extent to which resources have been mobilized for development outside conventional financial mechanisms is encouraging. The Asian countries are aware that the main burden must be borne on their own resources, though external aid can smooth and accelerate progress towards a higher standard of living. They are aware, too, of the difficulties that attend planning within a framework of democracy, and for some of them the problems of development are rendered infinitely more complex by political and economic instability and the scarcity of trained administrators and technicians.

---

* The Colombo Plan, Technical Co-operation Scheme Colombo. July 1954 (London H M S O, 1954) 1s net

† The Colombo Plan Ottawa, October 1954 Cmd 9336 (London H M S O, 1954) 4s net

Despite these problems, the future of the Plan appears promising now that its members are conscious of a great and growing partnership, animated by a common purpose and increasing awareness of each other's problems and aspirations. That future is all the more promising in view of the prospects of American economic aid to this area. The Colombo Plan has, it should be recognized, gone some way to create the conditions in which such additional money can be effectively used. The primary need for technical aid is being met, and some steps have been taken to hammer out a well-balanced and intelligently applied economic programme which can counteract inflation. Evidence of maturity is growing; but this is a slow process and care will be required if the new American proposals are not to tempt the backward countries to take on huge programmes of development with their own overtaxed—and often corrupt and inefficient—administrations.

Perhaps even more important, no new offer or programme should promise conditions which will disturb the understanding and partnership which have already been established under the Colombo Plan. Neither ideology nor propaganda has anything to contribute towards the solution of the acute problems of economic development in South and South-East Asia, and either could easily hinder progress. That needs to be remembered as much by the critics of the British Government's proposals for Colonial development and welfare as by the Administration in Washington, where the future size and scope of American economic and technical aid to Asia is at present being debated.

Last November, Mr. Harold Stassen, director of the Foreign Operations Administration, suggested that, while Western Europe is no longer in need of American economic aid, the time is ripe for a massive effort to aid the economic development of the free nations of Asia. He had already denied that his Government, which attended the Ottawa meeting as a full member for the first time, would use the Colombo Plan as its main instrument for channelling economic aid into Asia. The Technical Aid (Point Four) Scheme, bilateral military and defence support agreements and the World Bank will continue to be the main agencies for American aid; and, while this new American initiative should be welcomed by all the Colombo Plan countries, much more thought is required as to the way in which the American contribution can best be given. If, for example, the financial contribution is on the scale that materia needs alone would require, the balance and th unique relationships of the Colombo Plan could easil be upset and distrust and resistance aroused b vested interests.

While any such generous gesture from the Unite States deserves to be warmly welcomed, and althoug the financial needs of the under-developed countrie are still great and scarcely diminished as yet by th Colombo Plan and other agencies, much joint stud is yet required before the manner in which America resources can best be made available can be determined. It is in this context that Britain's plans fo Colonial welfare and development need to be considered. Her contribution to the Colombo Plan an to the Technical Assistance Programme of th United Nations is not one of which she needs to b ashamed, and it is only a small part of the contributio made from her limited resources to world welfar. Apart altogether, however, from such questions a the tempo of development, the order of prioritie and the magnitude of the resources we can afford t allocate for overseas development, Britain has bot a great responsibility and a unique opportunity fo leadership in evolving the appropriate forms o co-operation and the safeguards against any attempt to use such schemes for ideological purposes. If tha opportunity is to be used, however, and tha responsibility faithfully discharged, Colonial welfar and development cannot continue to be made th plaything of party politics. Both major politica parties must bring to the task the magnanimity, th vision and the statesmanship without which n financial generosity is likely to achieve its purpos of securing a fuller economic development of th under-developed countries and a clearer understanding and closer co-operation between them an the Western world.

PHYSIOLOGY AND ANIMAL PRODUCTION

Progress in the Physiology of Farm Animals

Edited by Dr. John Hammond. Volume 1. Pp vii+392. (London: Butterworths Scientific Publications, 1954.) 45s. net.

IN recent years the lack of either an adequate textbook or a comprehensive reference book recordin the marked advances in the scientific study of anima production has been seriously felt by all whos interests lie in this field. On one hand, as Dr. John Hammond rightly points out in his preface t this volume, "present day medical and veterinar textbooks cover too narrow a field"; on the other scientific contributions range widely and tend eac to be highly specialized; they are reported in suc a multiplicity of publications that even researc workers find increasing difficulty in familiarizin themselves with progress in their own sector an much more in the field as a whole. But, quite apar from the needs of advanced students, researc workers and teachers, there has developed a marke awareness on the parts of farmers and stockme engaged in animal husbandry that successful practic must depend upon a sound foundation of applied physiological knowledge

No one person can be said to have changed the attitude of the practitioner to his work and problems more than Dr Hammond, whose own research and influence have contributed so greatly to the development of scientific animal production. It is therefore of considerable interest to notice his appreciation of the general needs, as marked by the topics into which he has segregated the general scope of recent scientific advances, and by the collaborators he has chosen to review them in the series of volumes of which this is the first to appear under his editorship

Clearly, progress in physiological studies has not been made on an even front, so that some variation in content, authority and scientific and practical significance of the different sections is only to be expected, particularly when the contributors have, wisely, been allowed a good deal of freedom of approach to their own particular interests Even so, it must be pointed out at once that this volume suffers from inconsistent proof-reading and inadequacies of expression as between various sections, together with some overlapping of matter, these minor blemishes can easily be overcome in future editions and in the further volumes of the series

Two main segments of the general field are covered here nutrition and metabolism, and environment Many considerations must obviously affect the sequence of contributions in such a compilation, but the present reviewer's preference would have been to give the latter some priority of appearance, not because of the nature of the contributions or their significance, but simply because the complex of ecological factors affecting animal production is that which the animal husbandman, and the scientist, are least able to control, yet largely decides the broad patterns of production as found in practice

In reviewing ruminant nutrition, K. L. Blaxter properly orients the discussion by starting with aspects of rumen development with age, and then proceeding to a useful, critical and thoroughly up-to-date treatment of the parts played by the rumen flora in carbohydrate and protein metabolism Following this, R Braude presents an equally thoroughly documented and comprehensive review on the nutritional requirements of the pig, which may well rank as one of the outstanding contributions to the literature of farm animal physiology for many years to come, in any event, it is valuable at the present time, and has an additional merit for advanced students in frankly indicating the gaps and weaknesses of current information in relation to practical conditions of pig management

In marked contrast to these, W Bolton has relied very largely on already available reviews of the field of poultry nutrition, and has sought, instead of bringing their matter up to date, to make a formal treatment of his topic possibly more appropriate to a text-book concerned particularly with biochemical aspects. Only eleven authors are directly quoted What, however, is taken to be the main conception of the whole volume is regained in D. P. Cuthbertson's section, which provides a most useful statement of the trace element situation in its broadest relations with animal production, particular care has been taken in the discussion of those complex cases where deficiency or excess of more than one element is involved.

About half the present volume is devoted to environmental considerations, to which N. C Wright's comprehensive examination of work on the ecology of domesticated animals forms a most appropriate introduction Breadth and precision of treatment are here most successfully attuned to yield another notable contribution to the literature, enhanced by the author's clarity of expression and the fact that this section is conspicuously free from proof errors Its value is such that it prompts a criticism—that from the wealth of his familiarity with this field the author might well have thrown out ideas regarding the techniques of study and on other ecological factors that await analysis.

J D. Findlay and W. K Beakley, active participators in research on the environmental physiology of farm animals, give a critical review of experimental work, in which they do not hesitate to suggest its practical implications or to point out the needs for further investigations, as, for example, on the neuro-endocrine systems. Their main concern is with the thermal environment and heat regulation in mammals, but J. C D Hutchinson in his review of heat regulation in birds has found it necessary to refer to man and to repeat some of their material in attempting to give a reasonable orientation to his, especially since he enlarges his task to include discussion of the role of birds in food production, particularly in the now under-developed agricultural regions.

The final section is contributed by N T M. Yeates, who has brought together old and new information on the influence of daylight changes on reproductive and other physiological processes, almost at times with special pleading to establish its fundamental significance in practical animal production

Dr. Hammond earns not only the congratulations but also the grateful thanks of all those whose needs he has so well sounded, for placing in their hands what must be regarded as an indispensable reference for this and a considerable future time.

J. E. Nichols

QUANTITATIVE GENETICS OF POPULATIONS

Symposium on Genetics of Population Structure held at Istituto di Genetica, Universitá di Pavia, Italy, August 20–23, 1953

Edited by Adriano A Buzzati-Traverso (Union Internationale des Sciences Biologiques Série B—No 15) Pp 141. (Naples Secrétariat général de l'U I S B, 1954. Distributed by Libreria Internazionale Garzanti, Palazzo Universitario, Pavia, Italy) 2 30 dollars

The twenty participants to this symposium included all the foremost authorities on the subject, with the exception of Sewall Wright The aim was to ensure an exchange of views on those aspects of quantitative inheritance which are most relevant to the genetics of populations For this reason there were few papers, most of the time was available for discussions Unfortunately, these have not been published Besides six papers, the Proceedings of the Symposium contain short comments by Dobzhansky, Lerner and Epling, the conclusions by Buzzati-Traverso and the scholarly but delightful address of thanks by Haldane These glimpses are certainly enough to whet the appetite of the reader and to make him the more regretful that the discussions have not been published in full

As to the six papers, Clayton, Morris and Robertson gave a summary of a long-term programme, still in progress, of selection for high and low numbers of abdominal bristles in *Drosophila* (It is a mystery why these authors, and most other geneticists, persist in calling the bristles 'chetae', instead of 'setae') One of the interesting results after five generations of selection is the great variation between replicates of the same selection experiment, as if initial sampling accidents were quite important.

A paper by Falconer dealt with the asymmetrical response in mice to selection for high and low weight and high and low milk yield In both experiments there was a more rapid response downwards than upwards The author suggests that this asymmetrical response would be expected in cases in which either or both "unequal initial gene frequencies" and "directional dominance" occur These two terms are defined precisely

Scossiroli reported on the results of selection for bristle number in *Drosophila* populations after heavy X-ray irradiations The starting populations used had been selected already for twenty-seven generations prior to irradiation, and further selection was no longer capable of producing further inheritable change After X-irradiation there occurred a new spectacular response to selection in the 'high' direction but not in the 'low' one It seems to the reviewer that the main interest of this work lies precisely in this difference It could be that X-ray-induced inheritable variation is mainly in the direction opposite to that for which natural selection had to work harder—a point well worth investigating at the threshold of the atomic age The canalization of developmental systems may be such that any one of them is more liable to upset one way than the other The genes picked up by natural selection in the past history of the species would buffer asymmetrically either there would be more acting against the direction of more likely disruption, or they would be more effective Destructive mutations are therefore more likely to act one way Artificial selection after irradiation will be more effective than before irradiation one way, but less effective the opposite way Contrary to the first impression which might be gathered, this experiment suggests that irradiation is likely to increase the rate of change, but only in the direction opposite to that of natural selection

Wallace reported on 'coadaptation' of the various linear arrangements of the third chromosome in wild populations of *Drosophila pseudoobscura* This paper contains such a wealth of valuable information that it is not possible to summarize it here It certainly convinced the reviewer that there is a tendency for pairs of chromosome sequences within one population to be reciprocally adapted in the sense of conferring increased fitness to the structural heterozygotes

A paper by Clausen considered the dynamic balance between variations or fluctuations in the environment and potential or expressed variation in populations One by Harland Lewis reported on chromosomal variation in the *Clarkia* genus He concluded in favour of causal relations between additional chromosomes and colonization of new habitats.

The summing up by Buzzati-Traverso, and the comments by Dobzhansky and Lerner, clearly showed how far the classic theoretical framework of population genetics has led, and how necessary it is that the change in outlook already in progress should go on and be put to test This change in outlook is essentially a shift of emphasis from the single gene to the integrated systems of chromosomes, the genotypes of the individuals and the whole gene pool of populations For this change in outlook the theoretical tools—statistical, ecological and developmental—are still lagging behind G PONTECORVO

BIOCHEMISTRY AND REPRODUCTION

The Biochemistry of Semen

By Dr T Mann. (Methuen's Monographs on Biochemical Subjects) Pp. xiv + 240 + 7 plates (London Methuen and Co., Ltd , New York John Wiley and Sons, Inc , 1954) 16*s* net

THE increasing use of artificial insemination in animal husbandry, and even to some degree in human medicine, is based to a considerable extent on knowledge of the metabolism of spermatozoa, their nutritional requirements and the physical conditions necessary to secure prolonged life outside the organism This body of knowledge has hitherto been widely scattered in publications, many of which are not readily accessible It is therefore with great satisfaction that one welcomes a monograph on this rapidly expanding subject, written by a man of science who, together with a number of co-workers, has made outstanding contributions to our knowledge of the composition and metabolism of semen Dr T Mann's book is the first comprehensive exposition of the biochemical facts and problems relating to reproduction in mammals as well as lower forms (including even an occasional paragraph about plants)

The biochemistry of semen may appear at first glance to be a very special field without much interest outside the rather narrow group of specialists actually engaged in research on seminal biochemistry , but in fact this book should appeal to a much wider public, including not only veterinary officers interested in artificial insemination and clinicians studying problems of human fertility, but also the general biochemist who through reading it will realize that the biochemical mechanisms operating in the elaboration of the numerous components of seminal fluid present many absorbing problems The general biochemist may also find that spermatozoa offer many advantages as a material for the study of intermediary metabolism in the intact cell, because they are easily obtained uncontaminated by other cell types, and their physiological activity manifests itself through easily observable movement

The difficulties which are inevitable when an attempt is made to review so heterogeneous a field have been solved in a very satisfactory way The introductory chapter gives a kind of cross-section of the book, surveying in a clear and sufficient manner the anatomy of spermatozoa and of the accessory sex glands, and gives a description in chemical and physiological terms of the various secretions contributing to the seminal fluid In the following two chapters is found a thorough and critical discussion of such topics as the physical and chemical criteria used for assessing the quality of semen, the freezing of sperm, spermicidal agents and the use of various diluents for spermatozoa

The second half of the book is devoted to a more detailed treatment of the impressive array of specific substances found in spermatozoa and seminal plasma Among these substances may be mentioned fructose, which in most species so far studied constitutes the main nutrient for the sperm cells, inositol and citrate, found in large amounts in some animals, ergothioneine, various choline compounds and a number of enzymes. This scholarly discussion of many fundamental biological problems should prove of considerable interest also to biochemists and physiologists working in other fields.

The historical background for the development of seminal biochemistry is by no means neglected; some readers may even hold that too much space is devoted to historical matters. In my opinion, however, this historical note is important in a book which will undoubtedly become the standard text in the field, and certainly contributes greatly to make pleasant reading. The illustrations are on the whole very well chosen, but a number of structural formulæ of simple substances (one of which contains two misprints) might well be omitted. The list of about one thousand references, though not complete, will be found very useful, and so will the subject index. Author, editors and publishers are to be congratulated upon the production of this excellent monograph.

F. Lundquist

AN ANTHOLOGY OF ANTHROPOLOGY

Primitive Heritage

An Anthropological Anthology. Edited, with an Introduction, by Margaret Mead and Nicolas Calas. Pp xxx+592. (London: Victor Gollancz, Ltd., 1954.) 21*s*. net.

In a brief introduction to this book, Margaret Mead refers to the change in the type of anthropological literature which has developed in the past half-century. The armchair school of collectors of tales and legends was succeeded by the comparative school, which has become more and more dependent for its material on first-hand accounts of the life of individual tribes. In the text itself there is an essay by Ruth Benedict, published in 1932, in which the same attitude is taken. The reader who picks up this book for the first time might therefore expect a marked bias towards writings emanating from the psychological or psychoanalytical school of anthropologists. Any such fears may be discounted. The collaboration between the anthropologist and Nicolas Calas, the distinguished art critic, has produced an extraordinarily interesting anthology which will serve its purpose—to leave the reader often unsatisfied and in the mood to ask for more.

The fairness of the selection can readily be seen by a glance at the contents. The work contains one hundred and eleven extracts, and of these only about seventy date from the present century. The beginnings of the anecdotal school are represented by Herodotus, Tacitus and Strabo. The various parts of the work deal with such fundamental happenings or activities as childbirth, puberty, marriage, war, sport, death and immortality. Even those who have read much of the material in its original form will find renewed pleasure in reading straight through the book, as the reviewer has done. The extracts are very well chosen. There are some surprising omissions; but the compilers would no doubt justify them. Frazer and Westermarck find no place in the book, and it may be suggested that Tylor has just succeeded in gaining a place. Malinowski is well represented, as also are Sapir, Fortune and Ratcliffe-Brown. Hermann Melville gets in twice. The modern reporter of an international football match might read with profit Catlin's description of the ball game among the Choktaw, written more than a century ago. From the literary aspect one of the finest extracts in the book is written not by a professional writer or by an anthropologist, but by an artist—Maya Deren's passage from "Divine Horsemen".

In addition to its extensive use as a bedside-book—which is quite probable—this anthology may well be recommended to the student of anthropology as a rapid introduction to the great literature of the subject. In its next edition the compilers should certainly provide it with an index.

MICROWAVE SPECTROSCOPY

Microwave Spectroscopy

By Prof. Walter Gordy, Prof. William V. Smith and Prof. Ralph F. Trambarulo. (Structure of Matter Series.) Pp. xii+446. (New York: John Wiley and Sons, Inc.; London: Chapman and Hall, Ltd., 1953.) 64*s*. net.

Microwave spectroscopy is a comparatively new branch of physics which has arisen out of the development of radar techniques during the Second World War. Already, however, significant contributions have been made to the fields of molecular and solid-state physics. This book, by Profs. W. Gordy, W. V. Smith and R. F. Trambarulo, attempts to survey and to summarize the information which has so recently been accumulated. Thus, it cannot be regarded as a text-book, although many research students will find it a useful and concise introduction to the techniques and results of this branch of spectroscopy. The major part of the book is devoted to topics concerned with the spectroscopy of gases; and although this is perhaps not unexpected in view of the contributions to this field from Prof. Gordy, nevertheless it does present rather a biased account when, of the three hundred and fifty pages available, only fifty are allocated to the discussion of the microwave investigations of the solid state.

After an introductory chapter on the techniques and design of microwave spectroscopes, there are three chapters summarizing the measurements on gases, one chapter on the microwave spectra of solids and liquids, and four later chapters devoted to nuclear properties, more detailed discussions of molecular structure and possible applications of the microwave experiments in other fields. The book is well written, admirably presented, and there seem to be very few printing errors. There are a large number of helpful diagrams and a valuable collection of references. The appendix contains an impressive amount of data in tabular form.

The book will undoubtedly appeal to the research worker wishing to refer to an up-to-date review of a rapidly expanding branch of physics. A book of this nature, however, suffers from a serious liability, since, in order to maintain its appeal, new editions must be available as the subject advances. In Britain the published price is 64*s*., and this is scarcely a price which can commend the book to scientific workers anticipating a later edition; many students may decide that the expense of the present edition makes ownership of the book a considerable luxury.

COAL AND SMOKELESS FUELS*

By SIR CHARLES ELLIS, F R S.

THE term 'solid smokeless fuel', as applied to domestic consumption in Britain, embraces the requirements of four classes of appliance (*a*) boilers and closed stoves, (*b*) openable stoves, (*c*) modern gas-ignition open fires, and (*d*) ordinary open fires

For boilers and closed stoves, anthracite and hard coke from coke ovens are excellent fuels, and 'Phurnacite', a manufactured fuel, is prepared specifically for this use All these fuels can also be used on openable stoves if these are carefully regulated A more reactive coke, such as gas coke, however, is really more suitable, and this type of fuel can also be used in modern open fires with their deep beds. These fires are, of course, even better served by the highly reactive specially carbonized fuels, such as 'Coalite' or 'Rexco', which can indeed be burnt quite satisfactorily on the ordinary open fire

Any new type of smokeless fuel can conveniently be described in terms of this classification by stating for which appliances it is eminently or reasonably suitable

It will be obvious that boilers and openable stoves are already fairly well catered for, and it is the provision of smokeless fuel for the open fire that presents the really difficult problem, for two reasons first, there are a great number of ordinary open fires, and secondly, any smokeless fuel that is to replace coal must be as reactive, that is, as free-burning, as coal

Coke, either hard coke or gas coke, will play an important part in any programme for the provision of smokeless fuel Unfortunately, only some of the coals found in Britain are coking coals, for example, it is impossible to make lump fuel directly in this way from powdered dry steam coal First of all it has to be mixed with pitch, and the resultant sticky mass pressed into the form of briquettes These briquettes have little strength, and would be very smoky if they were burnt because of the pitch they contain To give them the requisite strength, and also to get rid of the pitch, they are carbonized in a heated oven These are the essentials of the 'Phurnacite' process for making use of this finely divided coal

It must be emphasized that among the manufactured smokeless fuels already on the market, 'Coalite', gas coke, and oven coke are all made from carbonization coals, that is, coals which when heated to drive off the volatile matter become plastic and form a coherent coke If, then, the supply of smokeless fuels for the domestic market is to be increased, the question immediately arises whether this should be by processing more and more carbonization coals From the purely technical point of view, such a policy could be implemented straight away by putting up more plants along existing lines, but the vital factor in determining the National Coal Board's research policy has been an appreciation of the long-term supply position of carbonization coals

In the year 1952 the total production of coals of the types customarily regarded as suitable for carbonization was 97 million tons, while the actual consumption of coal by the coke and gas industries was 53 million tons At first sight, therefore, it would appear that there would be no difficulty at all in meeting the demands of these industries for coal In fact, however, the comparison ignores at least two important considerations First of all, a large tonnage of coking and gas coal (36 million tons in 1952) was too high in ash content or in sulphur content to meet the rather exacting specifications of the carbonizing industries From the balance of coal that is suitable in quality must now be subtracted the large coal, the total production of which is barely sufficient to satisfy demand (chiefly from the railways and the domestic coal market) The result of all this is that, far from there being a surplus of carbonization coal of these types, there is actually a deficit, which amounted in 1952 to 8 million tons This deficit is made good by the distribution to the gas industry of coal that in former days would have been regarded as too low in rank to be suitable for gas manufacture because the make of good coke was unsatisfactory. The tonnage of lower-rank coal taken by the gas industry has been increasing steadily for many years

Difficult as the position now is, it will not become any easier, because, speaking generally, British output in future will contain more of the lower-rank coals, which are easier to get than many of the higher-rank carbonization coals The coal requirements of the carbonizing industries are, on the other hand, expanding every year, both in terms of actual tonnage and in proportion to the total consumption of coal This is shown quite simply by the comparative figures for 1939 and 1952 in the former year the tonnage of coal supplied to the coke and gas industries was slightly more than 39 million tons, or 21 4 per cent of the total home consumption, whereas in 1952 it had risen to 53 million tons, or 26 per cent of the total

The realities of the situation make it imperative that any extension in the production of smokeless fuels should not make the supply position more difficult by utilizing high-rank carbonizing coals, new developments should depend on the comparatively low-rank general purpose coals

This was the situation that led the National Coal Board to decide that it must have some process by which it could manufacture smokeless domestic fuels from coals which would always be in ample supply, any new process must, moreover, use as its starting material fines or powdered coal, and not large coal or sized coal for which, generally speaking, demand is already in excess of supply

The two things to be done are, first, to agglomerate small or powdered coal into sizes and shapes chosen to suit their subsequent use, and secondly, to make this agglomeration smokeless

One further point must be made in order to explain the attitude of the National Coal Board to the problem The Board intends to develop a range of smokeless fuels that will be specialized to their individual purposes and will be premium fuels Though the urgency of the situation is clear, it would be wrong to be led into panic measures to deal with it To supply the necessary quantity of smokeless

---

* Substance of a Friday Evening Discourse at the Royal Institution on December 10

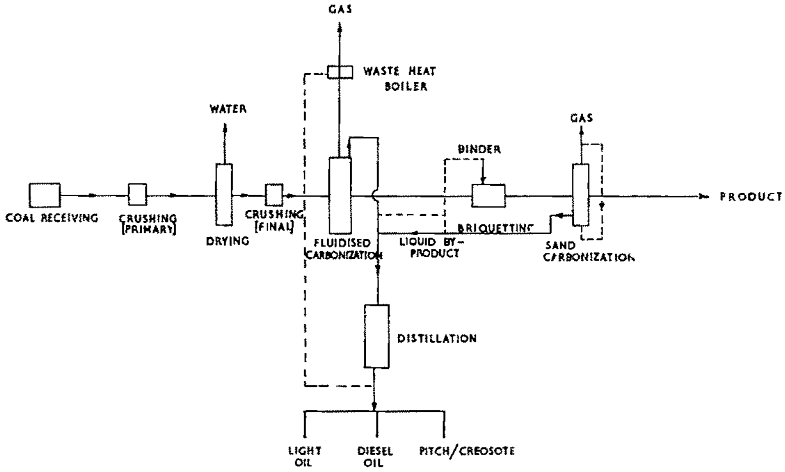

Fig 1 General flow diagram of combined process of fluidized devolatilization, briquetting and carbonization

fuel in one way or another may possibly involve the country in spending more than £200 million in building plants that may have a life of forty years To spend all this money on plant to produce smokeless fuel that is perhaps just good enough, but which no one really likes, would be ruinous The aim must be to build for the future and to develop new processes that will represent a real technological advance, based on the acquisition of new knowledge

The Board's Research Establishment at Stoke Orchard has for the past two years been focusing all its efforts on this problem, and from the beginning one thing was clear if the fuel was to be smokeless, it meant that a large amount of volatile matter had to be extracted, but the economic success of the operation would depend very largely on the extraction of that volatile matter in a useful and saleable form A series of operations on the coal, in contrast to the simple single process of the coke oven, was also envisaged, but if this were to be economically feasible, it would be essential to use the efficient methods of modern chemical engineering For these reasons, almost from the beginning it was decided to treat the coal in a fluidized state

The fluidizing process is now well known and is common practice in many industries If air or some other gas is driven upwards through a column of fine granular material such as sand or coal-dust, it is possible so to adjust the flow that the individual particles are practically airborne, and the mass as a whole has the mobility normally associated with a fluid The material has an average density corresponding to the degree of aeration, and objects will float or sink in it just as if it were a true fluid. If either hot inert gas or superheated steam is used as the fluidizing medium, then not only can the coal be moved from vessel to vessel like a fluid, but also it can be heated at the same time

Probably the most important advantage of this new approach is that it provides a better way of extracting volatile matter. The hot stream of fluidized gas acting on each of the separate small particles extracts the volatile constituents much more quickly, and as a result they are not broken down to anything like the same extent as in high-temperature carbonization in a coke oven, or indeed in some of the conventional low-temperature methods

The fine char that has been devolatilized in this fluidized process is a difficult material to compact and briquette, and a number of ways of doing this are under investigation The most promising involves the use of a binder, and since this binder, like the

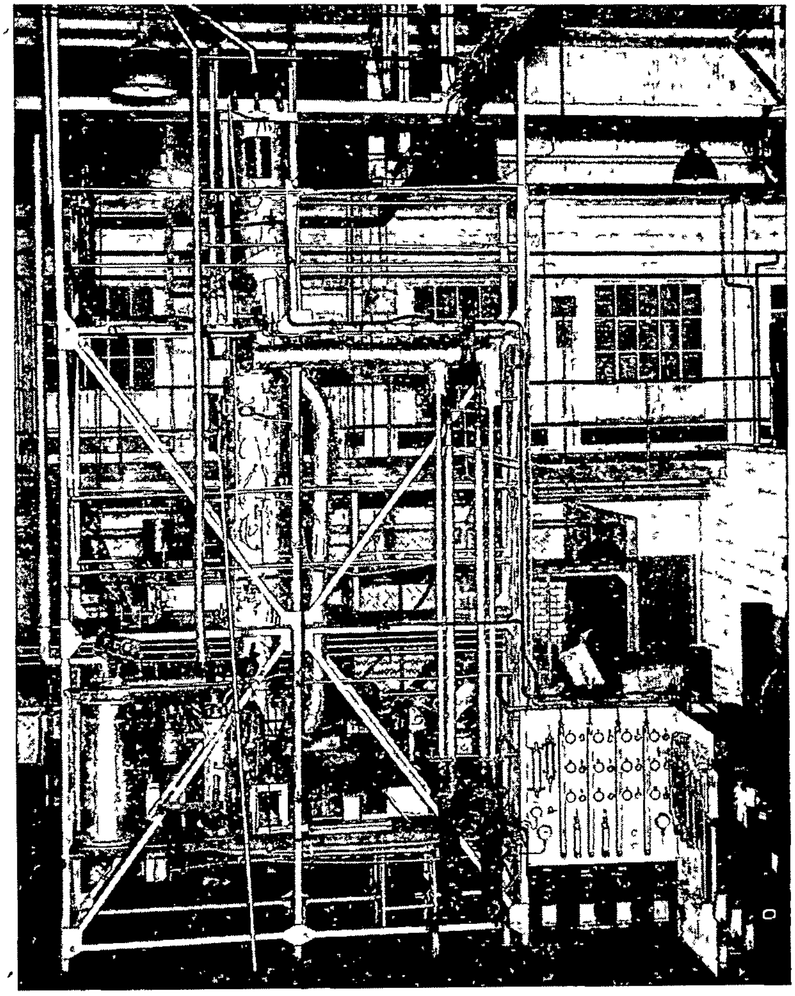

Fig 2. Experimental plant for combined devolatilization, briquetting and carbonization at Stoke Orchard

pitch used in the manufacture of 'Phurnacite', is smoke-producing, a second carbonization is necessary. Such multiplication of stages could not, of course, be contemplated using batch-wise operation with equipment composed of a large number of individual units, as in a coke-oven or 'Phurnacite' plant. This has been avoided in the first heating stage by using the fluidized method; but obviously another method has to be sought for treating the briquettes.

This major difficulty has been overcome by using a method of hot-sand carbonization. In this method the briquettes move through a single large vertical vessel much like a continuous vertical gas retort; but the essential new feature is that they are heated up to carbonizing point by a stream of red-hot sand that flows continuously around and past them.

The advantages of this new method of carbonization are great. First of all, it gives much more rapid carbonization, and therefore lower capital costs per ton carbonized per year. Secondly, it is a continuous process and gets away from the bogey of batch operation.

Fig. 1 shows the general flow diagram of the combined process of fluidized devolatilization, briquetting and final carbonization.

Finely divided coal goes into the large carbonizing vessel, from which come off the gas and liquid products. While still hot, the char is airborne into the briquetting stage, where it is mixed with pitch tar derived mainly from the second carbonization, but with some make-up from the first carbonization. The briquetting is carried out at a high temperature, and with the least possible loss of heat the briquettes go into the sand carbonizer.

Although it is impossible at this stage to give precise figures for the yields of the various products from the combined process, it seems likely that for every 1,000 tons of coal going in there would be produced about 660 tons of a clean uniform briquette with about 15 per cent of volatile matter. This fuel would be smokeless but would light with paper, and would give a bright, cheerful fire.

In addition to this solid fuel, there would probably be about 1,000 gallons of light oil, 4,000 gallons of diesel oil, and 15,000 gallons of pitch/creosote boiler fuel. The gas would practically all be used in supplying heat for the process; it is also an attractive feature that the plant would produce its own binder. It may be said, therefore, that the coal is carefully taken apart and reconstituted into two forms, uniform briquettes of controlled volatile matter and a liquid fuel.

There is still, of course, a long way to go before the process is in commercial operation. Its feasibility has, however, been established in experimental plant on a 50 lb./hr. scale, and good progress is already being made on the next stage, which is forty times larger—that is, one ton an hour. After that, the process will have to be carried to the pilot development stage of, say, 20–40 tons an hour through-put. Fig. 2 shows the 50 lb./hr. plant at Stoke Orchard.

In parallel with the development of the combined process just described, some further work at Stoke Orchard has been concerned with the ever-recurring difficulty that, in order to make smokeless lump fuel from the small coal of the really abundant reserves, it is necessary to go to all the trouble of putting in something sticky to hold the coal together, and then carbonize this to form a firm cement. The pitch that is frequently used is not only expensive, but also half its value is lost when it is carbonized.

Quite recently at the Board's Research Establishment at Stoke Orchard there has been discovered a simple method by which hard briquettes can be made from these high-volatile coals without using any binder at all. The briquettes made by this method can be carbonized, either in an ordinary oven or by the new process of sand carbonization, to give a final product of great strength.

This discovery has great potentialities and may revolutionize thinking on the whole subject of supplies to consumers, for if by a simple method it is possible to re-form coal from fine dust without having to fall back on the rather clumsy expedient of adding pitch, a considerable step has been made towards meeting the shortage of lump coal. The Board can face with equanimity a greater and greater production of fine coal, and can turn this into sized coal of whatever size the market demands.

The fact that this method provides a very simple way of making a strong coke of any reasonable size from a non-coking coal may be of great help in the future in removing anxiety concerning the reserves of the precious carbonizing coals.

In conclusion, it must be emphasized that all these developments are still only in the research stage. Difficulties and disappointments will be met, and the pattern of demand may have changed somewhat in a few years time; but even if the exact application of this new discovery cannot be foreseen, it seems certain that it constitutes a significant advance.

POWDER METALLURGY

POWDER metallurgy is an ancient art but a comparatively new science in spite of the fact that, for fifty years or more, metals of high melting point, such as tungsten, have been manufactured in massive form by the sintering of the metal powder. The development some thirty years ago of sintered metal carbides, initially for machine tools, opened up a field which rapidly assumed considerable importance in the engineering industries, and which has steadily expanded both in scope and in the nature of the sintered material. It was not until the Second World War, however, that powder metallurgy began to assume increasing importance for the manufacture of general engineering components and of alloys to precise composition and property specifications. In 1949 a symposium held in London directed attention to the ever-broadening scope of the industry and of the trends in its development.

The considerable progress which has been made, both in the science and practice of powder metallurgy, during the intervening years was clearly demonstrated at the second British Symposium held in London during December 1 and 2, under the auspices of the Iron and Steel Institute, in association with the Institute of Metals. A significant expansion in the manufacture of metal powders and in the diversity of components produced from them has been coupled with developments in manufacturing equipment and techniques, while both pure and applied research work has led to a better understanding of the basic principles on which the industry is founded.

A total of fifty papers was presented at the symposium, of which approximately 25 per cent were submitted from overseas. They were discussed in four half-day sessions under the following headings:

Group I Manufacture, Properties and Testing of Powders; Group II Principles and Control of Compacting and Sintering; Group III Manufacture and Properties of Structural Engineering Components; Group IV Powder Metallurgy of High-Melting-Point Materials.

The considerable interest in powder metallurgy was reflected in the attendance at the meeting, which attracted more than five hundred delegates, of whom approximately ninety came from overseas.

Manufacture, Properties and Testing of Powders

Developments during recent years in the manufacture of metal powders have been aimed primarily at reducing the cost, while improving the control and quality of the product. A significant trend is towards methods in which the powder is the direct end-product of the process of extraction of a metal from its ore, rather than in the disintegration and comminution of metal in bulk. The gaseous reduction of metal oxides, the reduction of iron oxide by an iron powder of high carbon content, electrolytic processes and the reduction of metal salts in solution by hydrogen at elevated temperatures and pressures are processes of increasing importance in this connexion. The manufacture of powders of ferrous and non-ferrous alloys by atomization is one of the most important developments in powder manufacture during recent years, particularly in view of its scope and comparative low cost.

The hydrogen reduction process has, for many years, been used in the manufacture of iron and iron alloy powders for magnetic purposes, particularly in the telecommunications industry. The control of the physical properties of the alloy powders so produced leads to a wide range of applications.

The physical properties of a metal powder, including the shape, density, surface condition and size distribution of the powder particles, have received special study in recent years, and considerable advances have been made in methods of examining these properties. The behaviour of brittle, tough and ductile metals on mechanical grinding leads to the interesting conclusion that, with soft metals, an equilibrium particle-size is reached irrespective of the initial particle-size used. While the control of quality of metal powders has undoubtedly improved as a result of investigations such as the above, there is still considerable scope for further study and for improvement, particularly when it is realized that surface films and absorbed gases can in themselves significantly affect the compacting and sintering properties of a metal powder.

Tantalum lamp filaments were made from the sintered metal at the beginning of the present century; recently this metal, together with zirconium and titanium, has assumed growing industrial importance. While arc-melting techniques are being developed for the latter two metals, tantalum, on the other hand, is likely to remain a product of powder metallurgy. Its extraction as a powder on a commercial scale, involving sodium or calcium reduction processes, is an interesting example of the scope of modern chemical engineering. Where titanium or zirconium is required in powder form, the metal sponge is embrittled with pure hydrogen and then ground. The absorbed hydrogen may be removed by sintering the compacted powder *in vacuo*.

Principles and Control of Compacting and Sintering

Excepting when liquid phases are present during sintering, sintered materials are porous. In certain cases, porosity may be deliberately encouraged, as in the manufacture of permeable bodies for filters, cooling units, porous bearings, etc.; for general engineering components, where the best mechanical properties are required, porosity is undesirable. One technique which has been developed to reduce this effect is to 'infiltrate' a permeable sintered metal skeleton with a molten metal of lower melting point.

Research work in the powder metallurgy field in recent years has paid particular attention to porosity in sintered components, either with the view of developing a theory of sintering, to control permeability where such a property is required, to note the effect of porosity on mechanical properties, or to study the process of infiltration. The mechanism of infiltration is similar to that of sintering in the presence of a liquid phase, where the primary property determining the processes involved is that of the free energy of the interface between the solid and liquid phases. The transference of the solid phase by a solution in the liquid phase determines the final structural condition obtained, which, in turn, will have a bearing on the mechanical properties of the component.

While the effects of re-crystallization and grain-growth on the progress of solid-phase sintering are clearly established, the mechanism of closure of isolated pores is still a matter of conjecture. Studies, however, of sintering in the presence of an active atmosphere, such as a halogen, which results in improved mechanical strength and ductility in sintered metals and a rounding off of pores, open up a new field of considerable scope. The use of a flux, either solid, liquid or gaseous, in order to ensure that true interparticle bonding is achieved during sintering is likely to enhance considerably the importance of powder metallurgy in the manufacture of general engineering components.

Studies of the nature in which uniform and non-uniform powder particles pack together are providing basic information on the properties of permeable sintered bodies. Perhaps, however, the most intriguing development work on the compacting of metal powders is that of the production of sheet or strip direct by the rolling of powder. Considerable success has already been achieved on an experimental scale with this technique, in which the compacted powder strip is eventually sintered to a density very close to that theoretically possible. This process, particularly if it can be coupled with sources of cheap metal powders, holds out considerable promise for the production of metal strip at very low cost.

The influence of the physical properties of metal powders on the mechanical properties of sintered compacts produced from them is not yet completely understood, although much information is being accumulated on this particular aspect. The difficulty, of course, is that there are so many properties of a metal powder particle which may have a bearing on the properties of the ultimate sintered component. Over and above this, the sintering atmosphere itself can play a most important part, and the choice of sintering conditions—either a controlled atmosphere or a vacuum—can, when everything else is under control, markedly influence the physical and mechanical properties of a sintered compact.

Manufacture and Properties of Structural Engineering Components

Various methods are employed in the manufacture of sintered metals for general engineering applications in order to reduce the porosity of sintered metal parts In general, sintered components show satisfactory mechanical strength but low ductility In recent years many investigations have been made of the effect of re-pressing and re-sintering on the strength and ductility of a wide variety of sintered metals and alloys Re-pressing and re-sintering increase the strength and ductility of sintered components, and it is reasonable to assume that this is achieved by improvement of the intergranular bond-strength by the breakdown of films, either solid or gaseous, which inhibit true bonding Re-treatments of this kind, however, are expensive and, undoubtedly, the use of a gaseous flux to ensure true bonding and hence satisfactory mechanical properties after one sintering operation only will figure prominently in future research work Investigations of this kind, undoubtedly, will also be related to improvements in the intergranular bond-strength in permeable bodies for turbine components, in which permeability plus high strength is required for parts which are maintained at a safe working temperature by means of a cooling medium such as air. The use of pre-alloyed stainless steel alloy powders for permeable components such as filters is now well established, but, up until now, such components have not met the strength requirements necessary for turbine components which are stressed in service

Permeable bodies have been used for some considerable time as oil-impregnated bearings, recent developments include the 'oilless' bearing materials, which consist of a porous metallic matrix impregnated with 'Fluon' The 'Fluon' is introduced into the porous skeleton either by hot pressing or via aqueous suspension, from which it is then sintered into the pores of the matrix Bearing materials of this kind run dry in corrosive conditions and permit the use of high surface speed when a liquid coolant is present at the bearing surface

Copper–lead bearings have been produced for many years by casting the alloy on to a steel backing This process is difficult to control, and the quality of the bearing material leaves much to be desired It is now possible to produce bearings of this type by a process in which the copper–lead is sintered on to a copper-plated steel strip, which can then be rolled to dimensional requirements and given a final sintering treatment High-quality bearings are produced in this way, and a study of the manufacturing process has contributed much useful information on the mechanism of sintering in the presence of a liquid phase

An important development in the powder metallurgy of light metals has been that of sintered aluminium containing a high but controlled percentage of aluminium oxide (about 13 per cent) The presence of the oxide results in creep and fatigue properties, at temperatures up to 400° C, superior to those of the best precipitation-hardened aluminium alloys Furthermore, the room temperature properties of the material remain unaffected after prolonged treatment at temperatures as high as 550° C Recent investigations have been concerned with the application of this principle to alloys of aluminium, and they show considerable promise Similar principles are being applied to the production of material of high-tensile strength from magnesium powder There is undoubted scope in the powder metallurgy of light metals, including perhaps titanium, for techniques similar to that developed for sintered aluminium

Powder metallurgy is now being used for the manufacture of alloys to precise composition limits in order to ensure close control over a particular property which may be sensitive to slight changes in the basic composition and to the presence of trace impurities In the electrical industry, certain alloys for sealing to glass are being made by powder metallurgy methods and the sintered alloy fabricated into strip or wire according to requirements Magnetic alloys of high permeability and low loss, based on nickel, are also being made by sintering followed by processing into strip. There is undoubted scope, particularly in the electrical industry, for alloys made in this way to precise composition limits

Powder Metallurgy of High-Melting-Point Materials

With the development of the gas turbine and the demand by the engineer for materials to withstand ever higher temperatures and stresses, it is of particular interest to note that one of the earliest groups of sintered products, namely, sintered carbides, is figuring very prominently in development work in this field Interest in this connexion centres mainly around titanium carbide for a number of reasons, including the fact that it is of relatively low density and has an encouraging strength at temperatures up to 1,000° C However, the resistance to oxidation of this material bonded with cobalt does not meet requirements, although the addition of other carbides, such as chromium, niobium, vanadium and tantalum, improve both the creep strength and the resistance to oxidation The high-temperature properties of these materials are determined largely by the properties of the matrix or bonding material, although it is considered that the primary carbide phase does influence the strength of the matrix. In this connexion, investigations into alternative bonding materials, such as heat-resisting alloys, indicate that creep strengths superior to those of the alloys themselves can be obtained However, the low impregnated strength and cold ductility, plus the difficulty of fabrication, are at present severe limitations on the accepted use of these materials for gas turbine components

In recent years considerable interest has been shown in alternative intermetallic compounds having high temperature stability, including silicides and borides of the transition metals Considerable investigations have been made in recent years on mixed metal–silicide systems Many of these compounds show exceptional resistance to oxidation at temperatures of 1,500° C or more, and recent studies have shown that this is due to formation of a protective oxide layer rich in silica Much further development work, however, will be required before compounds such as silicides are accepted for engineering applications, primarily because of their extreme brittleness and the ease with which they react with metals considered for bonding them

The possibility of manufacturing certain of the existing high-temperature alloys by powder metallurgy methods have been investigated These materials in the right condition normally depend upon complex carbides for the development of satisfactory high-temperature creep-fatigue resistance The introduction of carbides in the necessary concentration in the equivalent sintered alloy presents difficulties, due to reaction between the carbon and the oxide present in the metal powders used The possible solution here may be the use of alternative precipitates to carbides for the development of satisfactory high-temperature strength.

Metal – ceramic mixtures are a comparatively new field for research and development of materials for high-temperature service Metal-bonded alumina compounds figure quite prominently in the investigations which have so far been carried out Satisfactory bonding between the metal and ceramic is essential for strength at high temperatures, and basic studies of the wetting of ceramics with metals form an important part of research work in this field As in the case of titanium carbides, the work has shown that a thin layer of bond metal has much greater strength than that of the bond metal in massive form, and this is attributed to the inability of the thin layer of metal to deform plastically Increasing information is becoming available on the high-temperature properties of ceramics bonded with metals The optimum composition would appear to be in the neighbourhood of about 50 per cent by weight of the metal The interesting point of view has been expressed that for optimum properties and, in particular, good resistance to thermal shock, the metal network and the ceramic network should both be continuous I JENKINS

EDUCATION AND TRAINING OF RADIO ENGINEERS

THE present demand of industry and the Services for more radio engineers has emphasized the continuing difficulties of education and training in this field Following a series of reports made by the British Institution of Radio Engineers on this subject a recent meeting of the Institution in London was devoted to examining some of the present problems

Opening the discussion, Prof E E Zepler (professor of electronics in the University of Southampton) stated that there is now scarcely an industry which does not, in one way or another, use either electrical communications or what is now called industrial electronics The British Institution of Radio Engineers has recently decided to extend the syllabus of its graduateship examination by including industrial electronics as a specialized subject as from 1956

The universities have not, so far, final degree courses in radio engineering Many universities provide specialized papers in communications and radio physics, but all too few universities have, in fact, a chair of radio or electronic engineering In consequence, education and training in the universities are not a main contribution towards the solution of our man-power shortage and, in the main, recruitment in the industry comes through the technical college

Prof Zepler feels that universities which, for various reasons, will not cater for a degree in electronics might be prepared to provide a fourth-year course, devoted wholly to electronics, for those who have taken a degree in physics or in electrical engineering

Prof Zepler invited discussion on the question of whether industry co-operates sufficiently with the universities and technical colleges in providing sandwich schemes and part-time release.

He said that the experience of some of the examining bodies, including the British Institution of Radio Engineers and the City and Guilds of London Institute, was that examination results show that students are, in the main, inadequately prepared for these examinations, but suggested that the results are not wholly the fault of the technical colleges, it might well be that basic training at the grammar schools and secondary modern schools is not adequate

Prof E Williams (professor of electrical engineering in University College, Cardiff) said that he has no doubt that, at one stage of the country's educational development, classics provided the quickest and most readily available training in straight thinking But nowadays we must surely quarrel with the principle that "it doesn't matter what you teach so long as it trains a man to think" The practice of radio and electronic engineering now rests on so extensive a basis of specialized physical principle and of particularized application of mathematics that its study is as much a contribution to true education as is the study of any pure science The desirable limits of specialization are imposed, not by educational considerations, but by vocational requirements A very broad study of physical principle is undoubtedly needed, but Prof Williams holds that, in the limited time available, it is both unpractical and unnecessary to prescribe a similarly broad study of related technologies Professional institutions have not the same function as universities, and it is reasonable to expect greater specialization in courses leading to the examinations of the former. Prof Williams thinks that the development of education and training in radio and electronic engineering will be seriously retarded unless the policy of regarding 'electrical engineering' as a convenient indivisible unit of subject-matter is abandoned.

Mr Hugh Warren (principal of the South East London Technical College) represented the Association of Principals of Technical Institutes at the discussion He feels that the term 'radio' should not be restricted to the connotation with which it might have started many years ago Instrumentation, control, radio-frequency heating, radar and an ever-widening field of applications now have to be added to the fields of valve manufacture, telecommunications and recording and amplifying equipment

Mr Warren said that perhaps half the 250 or so technical colleges in Britain have seriously concerned themselves with the training of radio engineers Just as there is no British standard radio engineer, so there is no attempt to prescribe a single course There are many courses and they reflect the complexity and variety of this rapidly expanding industry They prepare for a wide variety of qualifications—degrees, diplomas, the National and Higher National Certificates, a number of different City and Guilds Certificates, and the examinations of the professional institutions. These fairly well-defined levels of qualifications blend into each other. Mr. Warren defied anyone to delimit the exact boundaries of a professional engineer He paid a tribute to the real co-operation both of organized industry and of individuals in industry, in the matter of courses and equipment After comparing British and French systems of apprentice-training, Mr Warren asked for guidance on the question of whether a new certificate in radio is needed. In mechanical engineering there is a certificate for those who are not going to be designers, but are going to be very good technicians, if not technologists. There is nothing quite comparable in radio. Mr. Warren wondered whether the technical college should, as in France, undertake more of the practical side of apprentice-training—or whether industry is content to undertake this. He concluded with a plea that education should find room for social thinking and an awareness of the economic and philosophical problems of our age.

Mr. R. E. Burnett (manager of the Education and Technical Personnel Department of Marconi's Wireless Telegraph Co.), expressing personal views, maintained that the radio industry is playing a full part in co-operation with the universities and technical colleges in stimulating recruitment and in planning the future training and education of radio engineers.

Agreeing that there is still a tremendous shortage of professional engineers in this field, Mr. Burnett stated that the larger companies are spending more and more money in developing their own training schemes, including the provision of the equivalent of college facilities. The smaller, but progressive, firms are in many cases making a proportional contribution to the problem of providing adequate training by co-operating with local technical colleges and in some cases making arrangements with the larger companies who are able to provide their own schemes. He advocated that there might be an extension of this principle in view of the increasing number of organizations which are not at present in a position to set up their own individual training schemes.

Agreeing with Mr. Warren that the question of selection is important, Mr. Burnett feels that too little is done to help the student who fails to reach professional status or even Higher National Certificate level. He advocated that courses and examinations should be so organized as to enable the candidate who cannot reach the higher level to be accommodated in the technician or craft level. Similarly, not enough is done to encourage the successful craft apprentice to go forward to secure professional status.

Some graduates hold the view that, having completed their university training, it is not necessary to follow on with a form of training or apprenticeship course. Most of the larger companies, however, have found that it is to the ultimate advantage of the graduate to undertake further training in the shape of an apprenticeship course, if only to have a first-hand understanding of the working of the various departments which go to make up a large organization. The graduate who leaves the university and is straightway employed on a special task tends to become insular in his outlook and not to use fully his academic training.

In general, the output of the universities is so comparatively small that industry is compelled to look to the technical colleges and the other examining institutions for recruitment to its professional ranks. In return, industry must be conscious of the need for arranging sandwich and similar courses (at present in very small numbers) in order to provide adequate training facilities for able young men who, for one reason or another, cannot undertake a full-time university course.

Other speakers in the discussion dealt with the shortage of teachers. Too many technical colleges are dependent on the services of the part-time lecturer who, by reason of his main job in industry, is unable to give adequate time and thought to teaching.

Mr. E. M. Wareham (chief engineer of Sanders Electronics, Ltd.) feels that there is a serious gap between the standard of training of a university graduate in electrical engineering or physics, and the standard required in the design and development laboratories. The average student has to have at least two years training and general experience before being entrusted with responsible electronic work in the design and development field.

Mr. C. W. Robson (head of the Electrical Engineering Department of the South East London Technical College) feels that very few firms are prepared to enter into an apprenticeship scheme which will give the technical colleges the maximum opportunity of playing their part in the thorough training of the younger man.

The technical colleges are, in the main, dependent on recruitment at the age of sixteen or seventeen years, when the work of the technical college has to be integrated with the activity of the employing firm. In the Ordinary National Certificate, Mr. Robson feels that there should be greater specialization in radio and electronics.

Other speakers expressed the view that industry, and particularly the radio industry, does not do sufficient to publicize in the schools the opportunities available in industry. The first contribution made by the radio industry in this connexion is the excellent booklet distributed by the Ministry of Labour on radio and electronics as a career.

It was suggested that a difficulty in persuading youth to go in for a radio engineering career is the fact that, in the first two or three years of technical college training, students are confined to training in electrical engineering. Mr. W. Dunn expressed the belief that, if the radio apprentice could, in his first three-year technical college course, secure acknowledgment and reward in the shape of an Ordinary National Certificate in Radio Engineering, his interest would be much better maintained than under the present arrangement of expecting him to take an ordinary National Certificate in electrical engineering before starting any serious study of radio and electronics.

E. WILLIAMS

OBITUARIES

Sir Shanti Bhatnagar, O.B.E., F.R.S.

ON New Year's Day, India lost a great public servant, Sir Shanti Swarup Bhatnagar, a man of exceptional ability and immense energy. As director of the Council of Scientific and Industrial Research, secretary of the Ministry of Scientific Research, and chairman of the University Grants Committee, he was the Prime Minister's right-hand man in implementing the policy to put science in the forefront of India's plan for the future. When inaugurating the forty-second session of the Indian Science Congress at Baroda on January 4, Mr. Nehru paid him tribute: "I have co-operated for the last six or seven years or more with Dr. Bhatnagar who, I think, has done—I say this with all respect due to others—more than anyone else for scientific development in India".

Twelve new national institutes and laboratories have been built, equipped and established in various centres in India* during the past six years, and most of them are now in full operation. Anyone who has seen these institutes cannot but be astounded by the energy and drive of the man who in so short a time created them Bhatnagar could well be called a master builder, for there is a unity of conception, and every detail, even the fountains in the gardens, had some special object emanating from his ideas In the words of Dr. H. J Bhabha, "in the short space of a few years Bhatnagar built the laboratories which are indispensable to any nation which aspires to leadership in the modern world, and he has provided the means whereby young Indian scientists of to-day and to-morrow can make their contribution to the betterment of India and its people" These laboratories will be an enduring monument to the imagination, enthusiasm and patriotism of Bhatnagar, who spared himself not at all He travelled far and wide to seek the latest designs, the most suitable equipment, the recent techniques which would help to promote the efficiency of his laboratories. He was undeterred, he went ahead and got things done—he did not permit finance to baulk his objectives and yet they were achieved at remarkably reasonable cost owing to his exceptional foresight and ingenuity.

Although this chain of laboratories is Bhatnagar's great achievement, it absorbed only part of his energies as secretary of the Ministry of Scientific Research and as director of the Council of Scientific and Industrial Research with its numerous committees and activities He was the mainspring of it all, and he had his finger on every detail of the Council's work. He possessed a clear, concise and well-docketed mind He was the first to arrive at the secretariat and his light was the last to go out, driving his assistants hard, he drove himself harder He had a kind heart and a keen sense of humour, and they appreciated the joy and privilege to work for him.

As chairman of the University Grants Committee, he had undertaken a further great and important ask Sir A L. Mudaliar, vice-chancellor of the University of Madras, stated that "Bhatnagar had just got into full stride as Chairman and it was a reat misfortune that at this stage the Commission should be deprived of his forceful personality, and his wisdom and guidance".

Alas, the strain of all this work for India and for science was too great, and in his sixtieth year his eart suddenly failed.

Bhatnagar was born in a small township near Delhi in 1895—the Prime Minister was present at his birthday celebrations held at the National hysical Laboratory (Delhi) last February—and the evotion accorded to him and the respect for his achievements must have pleased him. His father as a teacher at Bhera in the Punjab, but he died hen Bhatnagar was only eight months old. He often spoke of his mother and the great influence she had on him during his early days at school, when with considerable struggle but great innate ability he managed to acquire the knowledge for entry to the Forman Christian College, Lahore. There he came under the influence of able professors, and took his M Sc. in chemistry in 1918 in the University of the Punjab. In 1919 he came to England and obtained admission to University College, London, where he worked under Prof. F G Donnan, for whom he had great esteem and affection. In 1920 he obtained a grant-in-aid from the Department of Scientific and Industrial Research and continued working on the stability and inversion of oil–water emulsions, and secured the D Sc, University of London, in 1921 After that he spent some months in Europe, at the Sorbonne and at the Kaiser Wilhelm Institute (Berlin), and was then appointed professor of chemistry in the Benares Hindu University, where he remained until 1924, having started a centre of physical chemical research In October 1924 he became professor of chemistry and director of the University Chemical Laboratories, University of the Punjab, Lahore, which post he held for sixteen years. This was his most active and fruitful period of research, during which he published many papers on physical chemical subjects—colloids, surface chemistry, photochemistry, and particularly magneto-chemistry He published, with K. N. Mathur, "Principles and Applications of Magneto-Chemistry", and devised with him an interference balance for magnetic measurements His research in magneto-chemistry gained him election to the fellowship of the Royal Society of London in 1943.

Bhatnagar was, from all accounts, a very inspiring teacher, it was as a teacher that he himself was most happy. He took great trouble about his pupils, and many were the unbeknown acts of kindness and generosity Not only was he a teacher of chemistry with a power of original work, but also he was widely read, and a gifted writer His Urdu poetry, which was cast in a light vein, was much appreciated. His interests were wide, he was gay in conversation, lively in debate, and a wonderful friend He had an unprejudiced outlook, having travelled widely and having many friends in many countries Albeit, he was a great patriot and ambitious for India's sake

In 1940, Lord Linlithgow (then Viceroy of India) was looking for a man to help to establish a government organization on the lines of the Department of Scientific and Industrial Research in Great Britain. He wisely chose Bhatnagar. Thereafter Bhatnagar became more closely linked with the Government machine at Delhi. It would have been difficult anywhere to find a man of more varied accomplishments, with such energy and drive. He had already had close connexions with industry. During his time at Lahore, he had devised processes relating to the purification of kerosene oil which proved helpful to Messrs Steel Bros It was characteristic of Bhatnagar to turn over emoluments received to public benefit, and he arranged with the company to found the Steel Bros. Research Scheme, which could be employed for research scholarships in the Punjab University Chemical Laboratories Such schemes were extended when further ideas led to support for research from other oil industries.

It was in connexion with his activities while still at Lahore that he was made O B E in 1936. He was knighted for his services on behalf of the Government in 1941

During the Second World War and in connexion with the work of the Council of Scientific and Industrial Research, Bhatnagar's ideas fertilized many activities—for example, the production of anti-gas cloth and varnishes, foams, vegetable oil blends as substitutes for lubricating oils, glass substitutes, synthetic resins and plastics from waste products He was the owner of a number of patents relating to textiles, wood products, mineral waxes, etc He was in touch with all the chief industrialists in India and had connexions with many leading technologists in other countries, furthermore, he was skilled in negotiation, so that, with his experience in university life and his many personal scientific friends, he became invaluable as the centre of the growing scientific organization within the Government of India When national independence came, the schemes on which his heart was now set quickly took shape Some of them, indeed, had already been decided (for example, the building of a National Physical Laboratory)

---

* National Physical Laboratory of India (Delhi), Central Road search Institute (Delhi), Central Building Research Institute oorkee), National Chemical Laboratory of India (Poona), Central od Technological Research Institute (Mysore), Central Electro-emical Research Institute (Karaikudi), Central Leather Research titute (Madras), Central Glass and Ceramic Research Institute lcutta), National Metallurgical Laboratory of India (Jamshedpur), ntral Fuel Research Institute (Dhanbad), Central Drug Research titute (Lucknow), Central Salt Research Institute (Bhavnagar)

Bhatnagar took a leading part in starting a number of projects, such as the formation of Indian Rare Earths, Ltd., for the processing of monazite sands and the search for atomic minerals. A number of metallurgical and chemical processes were developed or changed to suit Indian conditions and India's needs, for example, the enrichment of manganese ores proved a valuable enterprise.

His administrative successes were frequent, it may be mentioned that he was successful in gaining exemption from tax for expenditure on research, and from customs duties on scientific instruments essential for research He was active in promoting the regional technological institutions, the Standards Institution and the National Research Foundation, and was a very useful member of the Council of the Indian Institute of Science, Bangalore. He instituted a documentation centre which was accommodated in the National Physical Laboratory building

Bhatnagar took a lead in all that was going on in science in India Before the War he had been sectional president (chemistry) of the Indian Science Congress (1928 and 1938). He was general president in 1944–45. He was president of the National Institute of Science of India (1947 and 1948), and as president in his address at the thirty-sixth session of the Indian Science Congress, he appealed to the young scientists of India for zeal in the cause of science and its application and zest for research

He attended many conferences in foreign lands, as representative of India He was a delegate to the Empire Universities Congress at Edinburgh (1931) and at Cambridge (1936), to the British Association and the Michael Faraday centenary celebrations (1931), and at the Liverpool meeting so far back as 1923. He was a member of the Indian Scientific Mission for the Government in 1945 and leader of the official delegation at the Empire Scientific Conference in 1946, and a member of the Indian Atomic Energy Commission which visited Great Britain in 1948. He attended the United Nations Scientific Conference on Utilization and Conservation of Natural Resources in New York, 1948 He made many tours to Europe and America in connexion with his work, and these included recently visits to the U S S R. and to South America

Bhatnagar was an honorary D Sc, Oxford (1946), and had received the honorary doctorate of Delhi, Allahabad and Patna, and was honorary professor of chemistry of the Universities of Delhi, Benares and the Punjab He was a Fellow of the Syndicate and member of Council of Benares University He was a Fellow of University College, London. He was a Fellow of the Institute of Physics and of the Royal Institute of Chemistry (London), and was made an honorary member of the Society of Chemical Industry (London) in 1943 and honorary vice-president (1945–48) He was a past-president of the Indian Chemica Society and recipient of the Reddy Prize in Chemistry 1947

The joy of Bhatnagar's full, eager life was marred by the loss of his wife, Srimati Iajwanti, in 1945. He had two sons and two daughters A son and daughter-in-law lived with him, and his home-life was still a happy one. He had a little farm outside Delhi in which he took great pleasure But one could not imagine his tireless soul resting at ease in this world while there was work to be done Providence ordained that he should suddenly be taken away so that others, by the very shock of his loss, may be fired with his zeal. He has provided the means fo scientists in India in many branches of science to d great work ALFRED C. EGERTON

Dr. G F. C Searle, F.R S.

A MEMORIAL service for the late Dr G F. C Searle, a former Fellow of Peterhouse, Cambridge who died on December 16, was held in the College Chapel on January 21, at which colleagues, forme pupils and friends gathered as a tribute to the passing of a notable personality.

Searle was the son of the late Rev. W G Searle and was born in the vicarage at Oakington, Cambridgeshire, on December 3, 1864 His ninetieth birthday was celebrated by a tea-party at the Cavendish Laboratory on December 3 last, when a large and distinguished company heard him give an account o his boyhood and youth, and of his introduction t physics when taken by his father to see the newly erected Cavendish Laboratory and shown over the building by James Clerk Maxwell, then recently appointed the first Cavendish professor of experimental physics.

Searle won a foundation scholarship at Peterhouse and, entering the University, read for the Mathematical Tripos, which he took in 1887, being classed as a Wrangler In the following year he studied physics for Part II of the Natural Sciences Tripos He began research work in 1888 in collaboration with Prof J J Thomson on a determination of the rati of the electromagnetic unit of electricity to the electrostatic unit, a research which was published i the *Philosophical Transactions of the Royal Society* This was followed by many independent publications mostly dealing with magnetic measurements o electromagnetic theory, but occasionally with properties of matter or heat. These researches gained fo him the fellowship of the Royal Society in 1905 an the award of the Sc D degree by the University o Cambridge in 1912

Searle was appointed to a University demonstratorship in 1890 and to a University lectureship in 1900 He retired from both posts in 1935. A the outbreak of the Second World War, however, h returned to work again and only gave up finally, an with reluctance, at the age of eighty-three, havin then worked under three Cavendish professors S J J Thomson has placed it on record in his book "Recollections and Reflections", that "Searle ha done more for the teaching of practical physics a Cambridge than anyone else". He taught a larg class in practical physics at the Cavendish Laborator —that for students working for Part I of the Natura Sciences Tripos—and for more than forty yea nearly every Cambridge man taking physics was a some time his pupil. On the occasion of his ninetiet birthday party, Searle claimed with pride to have taught more Fellows of the Royal Society than any other teacher, and also that both the father and the mother of the present Cavendish professor had been his pupils

As a University lecturer Searle gave regular courses of lectures for Part II of the Tripos in classical electricity and magnetism and in heat He also, for a time, gave lectures on mathematics for students of physics. But it was his work as a demonstrator which gave him his pre-eminence He showed great skill in devising laboratory experiments suitable for instructing students, and in designing the necessary apparatus It is these skills which have carried his name and his teaching methods into the physics departments of almost every university and technical college in the world, and into the science laboratories of most progressive schools His experiments were never commonplace, their originality and elegance made a special appeal to students, so that they became keen to try them With each experiment he supplied a manuscript, written in his own hand, giving an account of the underlying theory, followed by a very full and clear description of the way the experiment should be made Some of these manuscripts have been published by the Cambridge University Press in a series of volumes Displayed on the notice-board of his laboratory was a list of instructions and exhortations to students beginning work in practical physics To many, the last paragraph of these was the most interesting. It dealt with the relations between students and their hard-worked demonstrators, exhorting students not to become annoyed if they did not get all the attention to which they felt entitled, but to be patient and remember that "demonstrators are only human and need your sympathy and your prayers at least as much as other men"

Dr. Searle married, in 1904, the widow of Mr. Thomas Parsons, of Wimbledon, and would speak most feelingly of the great help and constant encouragement he had received from her throughout their happy married life. He was above all a staunch Christian He was active as a lay reader of the Church of England and keen and enthusiastic about any duties he undertook. As a teacher his manner was perhaps rather brusque and a little forbidding to students meeting him for the first time, but his obvious earnestness and lively interest in them and their work soon overcame this, and he was held in respect and admiration by a large circle of students and friends FRANK HORTON

NEWS and VIEWS

Rothamsted Experimental Station: Dr R. K. Schofield

THE appointment of Dr R K Schofield to be head of the Chemistry Department of Rothamsted Experimental Station, in succession to the late Dr E. M Crowther, is a tribute to his versatility He went to Oundle School and won an entrance scholarship to Trinity College, Cambridge, in science and mathematics He took physics, chemistry and botany in Part I of the Natural Sciences Tripos, and his progress was marked by the winning of a senior scholarship and a first class in Part II (Physics) His special interest in the borderland between physics and chemistry led him to do his Ph D research on the physical chemistry of surfaces under Sir Eric Rideal For two years he was lecturer in physics at Durham and then joined the Physics Department at Rothamsted, of which he became the head in 1947 in succession to Sir Bernard Keen He is a recognized authority in the moisture relationships and colloidal aspects of soil, and in recent years has been particularly active in applying and extending the concept of the diffuse electric double layer He has been chairman of the Colour Group of the Physical Society and was visiting professor of soil physics at Cornell University during the winter of 1951–52.

Dr H L Penman

DR SCHOFIELD is succeeded as head of the Physics Department at Rothamsted by Dr H. L Penman, who graduated in the Newcastle Division of the University of Durham in 1930 with a first in physics After research in acoustics with Dr E. G Richardson, he joined the Photochemistry Section of the British Cotton Industry Research Association in Didsbury, leaving in 1937 to go to Rothamsted. Until 1941 he worked on diffusion of gases and vapours in soil, soil temperature, and on drainage and evaporation During 1941–44 Dr. Penman was in the acoustics section of the Mine Design Department, Admiralty, at Portsmouth In 1944 he returned to Rothamsted to resume his evaporation studies, and since then has been able to show that the use of water by vegetation is a physical process the rate of which is dictated by weather, and is calculable from weather data. The general utility of this work in irrigation control and in hydrology led to an invitation from the Waite Agricultural Research Institute, Adelaide, to spend six months in Australia (1951–52), where, supported by a Nuffield Fellowship, Dr Penman was able to study the water conservation and irrigation problems of south-east Australia. Dr Penman has been honorary secretary of the London Branch of the Institute of Physics, has served on the board of the Institute, and at present is an honorary secretary of the Royal Meteorological Society and a vice-president of the Association Internationale d'Hydrologie Scientifique.

Zoology at Fordham University: Prof A A. Wolsky

PROF. A. A WOLSKY, former professor of zoology in the University of Budapest and director of the Hungarian Biological Research Institute at Tihany, has been appointed professor of experimental embryology in Fordham University, New York. Following his formal education in Budapest, Dr. Wolsky did postgraduate work abroad under fellowships from the Hungarian Government, the Rockefeller Foundation and the Swedish Institute of Cultural Exchange This included studies in London in 1931, Cambridge in 1934, and at the Wenner Gren Institute, Stockholm, in 1935. In 1947 the Hungarian Government permitted him to return to Stockholm for a year At the end of that period he refused to return to Hungary He joined Unesco as principal scientific officer for South-East Asia, stationed at Djakarta Indonesia He has held that position for six years Dr Wolsky is the author of

"Genetics and the Origin of the Species" and "Biological Lexicon" His published papers deal largely with problems of experimental embryology and embryological genetics

The Canadian Defence Research Board

MR. E LL. DAVIES, vice-chairman of the Canadian Defence Research Board, has resigned and has been succeeded by Mr. A. H. Zimmerman, a prominent Canadian engineer. Dr G. S. Field, formerly scientific adviser to the Chief of the Naval Staff, has been appointed chief scientist Dr. N. W Morton, chief of the Division involving operational and medical research, human resources and environmental protection, and Dr. John W Abrams, superintendent of the Board's Operational Research Group, have been appointed scientific advisers to the Chief of the General Staff and the Chief of the Air Staff, respectively. Dr. F. H. Sanders is to become scientific adviser to the Chief of the Naval Staff. Mr G. M. Carrie, whose Division is concerned with special weapons and northern activities, and Dr J. J. Green, chief of the Division which directs activities in the fields of armaments and aeronautics, will combine with their present duties the task of increasing and reorganizing the headquarters' scientific staff. Dr William Petrie has been appointed acting superintendent of the Operational Research Group

Shipbuilding Research in Britain

A MEETING of the Parliamentary and Scientific Committee on December 7 was addressed by Mr Charles Connell, chairman of the British Shipbuilding Research Association, and by Dr. S. Livingston Smith, the director of research, on recent developments in research and technology in the British shipbuilding industry. Mr Connell, who limited himself chiefly to questions of policy, pointed out that British shipbuilding has a long history of technical progress and cannot be accused of backwardness in applying scientific ideas It should be remembered, moreover, that a ship and its machinery represent a capital investment of the order of £1 million with a working life of more than twenty years Mr. Connell, however, is concerned about the question of publication of research results, and urged that results likely to benefit industry should only be communicated to British industry in the first instance. In shipbuilding research, the policy is to send all research results first to member firms in confidence, and later the commercial advantage of each report is assessed on its merits before a decision about publication is taken. Mr Connell also pleaded for further financial support from the Government for the Research Association, in view of foreign competition

Dr. Livingston Smith, in his paper, gave some details of the work of the Association, much of which is undertaken extra-murally and on board ship The Association has shown that reductions of up to five per cent in frictional resistance of a ship's hull can be obtained by a better finish on the painted surface, and tests at Glengarnock on full-scale components of ships' structures have led to improvements in construction and large savings of steel A comprehensive series of tests of propulsion and resistance carried out in ship-model testing tanks on a range of models of ocean-going merchant ship forms have yielded data of great value to designers, and investigations on noise have led to the adoption of less expensive methods than that of acoustic lining in the engine room and elsewhere. Investigations into the causes of crankcase explosions and their prevention promise to reduce considerably this hazard.

Nuffield Foundation : Ten Years Grants

THE Nuffield Foundation has now published the second part of its review of its first ten years (pp. 319 The Foundation, London, 1954), which was promised when the review of the main policies pursued and the kinds of work supported was issued in 1953 (see *Nature*, 171, 851, 1953) In doing so, however, that admirable first part has been incorporated in the appropriate sections of this report, so that this new volume gives a more detailed record of the grants themselves and the progress made, to which are appended complete lists of Nuffield Foundation Fellows, Scholars, Bursars, etc, appointed during the first ten years and published research attributed, in whole or in part, to the Foundation's grants and awards, in this way it provides a clear guide to the policies pursued and the principles determining grants. The first part is thus entirely superseded by the second save only where it may be a convenience to have the general account run consecutively and unbroken by detail. Be that as it may, this report on grants made during the ten years April 1943–March 1953 will stand on its own as an authoritative and well-arranged reference work on the Foundation's activities during that decade There is an adequate index. This admirably written account of the way in which the private and independent institution can still function in the Welfare State provides a most impressive vindication of the principle of voluntary action.

Fellowships, Scholarships and Bursaries

THE Nuffield Foundation is offering a number of scholarships and bursaries for postgraduate training in biology and sociology. Those in biology are intended for graduates in physics, chemistry, mathematics or engineering, those in sociology for graduates in the natural sciences and the humanities Applicants should be 22–35 years of age and normally resident in the United Kingdom. The scholarship is valued at £500–600 a year (plus fees), with certain allowances for married holders, a bursary is valued at £350 a year (plus fees), also with certain allowances. Applications for the biological awards must be made by April 1; those for the sociological by May 1 The Foundation is also offering fellowships and scholarships in dentistry in order to enable holders with dental qualifications to receive such additional training in pure and applied science as is desirable to fit them for an academic career in dentistry or to assist university graduates in medicine or science in receiving training which will qualify them to undertake teaching and fundamental research in dental health and disease. A fellowship is valued at £500–800, with travelling expenses, a scholarship covers tuition fees and a subsistence allowance of up to £200 a year. Applications for fellowships must be made by March 1, those for scholarships by June 30. Further information can be obtained from the Director, Nuffield Foundation, Nuffield Lodge, Regent's Park, London, N.W 1.

Statistical Methods in Industry

THE International Statistical Institute has just begun publication of the *International Journal of Abstracts on Statistical Methods in Industry* (annual subscription 2 50 dollars (18*s* or 9 50 guilders), from the Institute, at 2 Oostduinlaan, The Hague, Netherlands), and three issues have now appeared. This bibliographical work is to appear three times a year and each issue will contain about a hundred abstracts of papers on the application of statistical methods in industry and technology published in all parts of the world. It is the intention of the editors to prepare the abstracts in such a manner that the reader will be able to judge whether or not the original article would be of interest to him. 'Industry' will be interpreted broadly to include transport, mining, generation of electric power and management problems in agriculture (but not agronomy). Theoretical papers that have direct industrial and engineering applications will be included. The abstracts will be in English or in French, and printed on one side only of thin cardboard, so that they can be cut out and filed as 3 in. × 5 in. cards. Industrial statisticians who are willing to co-operate in the preparation of abstracts are invited to communicate with the appropriate regional editor; for the United Kingdom, he is Dr. E. H. Lloyd, Department of Mathematics, Imperial College of Science and Technology, London, S.W.7.

Decay of Wood in Boats

BULLETIN No. 21 of Forest Products Research, Department of Scientific and Industrial Research (London: H.M. Stationery Office, 1954), deals with "Prevention of Decay of Wood in Boats". In the days when all ships and boats were built of wood, the problem was a serious one because the nature of the decay was not understood and so no prevention or cure could be applied. In the eighteenth and nineteenth centuries naval authorities were seriously alarmed at the rapidity with which timbers in wooden battleships deteriorated and many remedies were tried without success. During and since the Second World War the problem has again become prominent owing to the increasing number of less-durable timbers in use. This bulletin is the result of a discussion between naval architects, representatives of boat-building firms and officers of the Forest Products Research Laboratory. As would be expected, the decay is found to be most serious in vessels which are laid up for parts of the year or are held in reserve. The bulletin describes with diagrams the fungi responsible for this decay and the conditions under which they develop. The decay is frequently alluded to by the term 'dry rot', which is caused by the fungus *Merulius lacrymans*. The name should be avoided, as this fungus is seldom found on a boat. The commonest wood-destroying fungi known to occur in boats are *Coniophora cerebella* (the cellar fungus) and species of the genus *Poria*. Methods for eradicating decay and preventing its development in new craft by the use of naturally durable timbers and modern wood preservatives are outlined.

Oil Palm Research

WITH the appearance of the second number of the *Journal of the West African Institute for Oil Palm Research* (September 1954), this new publication may be said to have got fairly into its stride. It promises to be of great value to all who are concerned with this important tropical crop. It combines in a useful way up-to-date investigations both of an applied and of a more fundamental character, while the critical reviews of other publications relating to oil palm matters seem likely to confer on the journal a centralizing and integrating function. The present number includes articles on the improvement of natural palm groves—an important domestic consideration in Nigeria, where most of the palm oil comes from this source—and the effect of cultural treatments on losses in the nursery. A sound foundation for future work on the diseases of the oil palm is provided by a preliminary account, with descriptions, illustrations and diagnostic key, of all the diseases thus far encountered in Nigerian territory. As the oil palm is often grown on somewhat, or even highly, impoverished soils, deficiency diseases assume a considerable magnitude from the point of view of both production and research. One of these diseases, described as orange frond, has now been shown to be due to magnesium deficiency and can be remedied by appropriate treatment. A further article relates to two new caterpillar diseases which may cause considerable destruction of palms.

Zoological Nomenclature

As from July 31, the International Commission on Zoological Nomenclature will start to vote on the following cases involving the possible use of the plenary powers for the purpose specified against each entry. Full particulars of these cases have been published on January 31, 1955, in Parts 1 and 2 of vol. 11 of the *Bulletin of Zoological Nomenclature*. (1) *Pleurotomaria* Sowerby (J.), 1821, validation of (if judged to be invalid); *anglicus* Sowerby (J.), 1818 (*Trochus*), validation of, and designation of, as type species of *Pleurotomaria* (Cl. Gastropoda); (2) *Pachyceras* Bayle, 1878 (Cl. Cephalopoda, Order Ammonoidea), validation of; (3) *Neanura* McGillivray, 1893, and *Hypogastrura* Bourlet, 1839, designation of type species for; *Achorutes* Templeton, 1835, suppression of (Cl. Insecta, Order Collembola); (4) *Crenophilus*, validation of, as from d'Orchymont, 1942; *aeneus* Germar, 1824 (*Hydrophilus*), validation of (Cl. Insecta, Order Coleoptera); (5) *Rhinopteraspis* Jaekel, 1919, validation of (Cl. Ostracodermi); (6) *Anurophorus* Nicolet [1842], designation of type species for (Cl. Insecta, Order Collembola). Attention is directed also to the proposed suppression of the generic name *Jumala* Friele, 1882, as a name calculated to give offence on religious grounds. The above Parts also contain proposals for the adoption of three 'Declarations': (*a*) relating to transliteration of words normally written in Cyrillic characters (preliminary to insertion in the Code as a schedule (Copenhagen decision)); (*b*) defining the status of a generic name published conditionally; (*c*) clarifying Rule (*f*) in Article 30 (type species of a nominal genus established as a substitute for a previously established such genus but with a different type species). Comments on the above cases should be sent as soon as possible to Mr. Francis Hemming, Secretary to the Commission, 28 Park Village East, Regent's Park, London, N.W.1.

The National Science Foundation, Washington

THE National Science Foundation, Washington, has announced 216 grants totalling about 2,650,000 dollars for the support of basic research in the natural sciences, for conferences and studies on science, scientific information exchange, for scientific manpower, and for travel of American scientists to international scientific meetings. This is the first group of awards to be made during the fiscal year 1955 by the Foundation for the support of basic research and related matters. Since the beginning of the programme in 1951, more than 1,100 such awards have been made, totalling about 11,141,000 dollars. In addition, the first grant, totalling 100,000 dollars, was made under a special appropriation for the International Geophysical Year. The research fields included are astronomy, chemistry, developmental biology, earth sciences, engineering sciences, environmental biology, genetic biology, mathematical sciences, molecular biology, physics, psychobiology, regulatory biology, and systematic biology. A list of the grants, including institution, name of principal scientist, title, duration and amount, can be obtained from the Secretary, National Science Foundation, Washington 25, D.C.

Ulster Folk Museum

THE *Museums Journal* of December 1954 announces that the Committee appointed by the Northern Ireland Minister of Finance has recommended in its report that an Ulster Folk Museum be established in the grounds of Belfast Castle at a probable cost of £60,000. The Museum would consist of buildings, implements and other objects displayed in a natural setting and under living and working conditions. Buildings of a traditional type would be rebuilt or copied and so far as possible put to their original use. The Committee suggests that the Museum should be established on a national basis, with substantial Government financial backing. The Corporation of Belfast has already agreed to make available at a nominal rent some 5½ acres in the grounds of the Castle.

Leicester Museum and Art Gallery

THE forty-eighth report of the Committee of the Leicester Museum and Art Gallery records the opening to the public of the herb garden and Deacon Clock workshop in Castle View. The new garden and the reconstruction illustrating one of Leicestershire's oldest industries provide, on the site of what was formerly a builder's yard, an amenity which has transformed this corner of old Leicester. The report is issued in an attractive form, and interesting acquisitions are recorded.

Colonial Service: Recent Appointments

THE following appointments have recently been made in the Colonial Service: A. L. Job (inspector of mines, Tanganyika), inspector of mines, Uganda; R. B. J. Deane, tea officer, Agricultural Department, Mauritius; K. G. Windsor, agricultural officer, Northern Region, Nigeria; B. J. Gee, fisheries officer, Northern Region, Nigeria; R. G. Dixon, assistant conservator of forests, Federation of Malaya; A. W. Gunthert, mineralogist, Federation of Nigeria; A. G. Royle, inspector of mines, Tanganyika; J. A. Armstrong, entomologist, East Africa High Commission; J. B. Davies, entomologist, Sleeping Sickness Service, Northern Region, Nigeria.

Planned Parenthood

THE fourth International Conference on Planned Parenthood was held at Stockholm during August 17–22, 1953, at the invitation of Riksforbundet for Sexuell Upplysing (National League for Sex Education) and was attended by 158 delegates and observers from twenty-one countries. A report on the proceedings has now been published and includes papers on such topics as world population trends and their relation to food supplies, current experiments in birth control, termination of pregnancies, sterilization, subfertility, sterility, artificial insemination, marriage counselling and sex education. Great Britain was represented on the organizing committee by Mrs. Margaret Pyke and Dr. Helena Wright on behalf of the Family Planning Association. This interesting and informative report may be obtained from the International Planned Parenthood Federation, 69 Eccleston Square, London, S.W.1, price 10*s*. 6*d*.

Symposium on Condensation Nuclei

A SYMPOSIUM on atmospheric condensation nuclei will be held in the School of Cosmic Physics of the Dublin Institute for Advanced Studies, 5 Merrion Square, Dublin, during April 26–28. Papers may be read and contributions to the discussions made in English, French, German or Italian; interpreters will be provided during the session. Papers from France, Great Britain, Ireland, Italy, Sweden, Switzerland, the United States and West Germany have already been promised. Notification of attendance must reach Prof. L. W. Pollak, at the Dublin Institute for Advanced Studies, before April 10.

Announcements

H.R.H. THE DUKE OF EDINBURGH has been elected an honorary member of the Institution of Electrical Engineers.

DR. J. N. HUNT, senior lecturer in Guy's Hospital Medical School, has been appointed to the University of London readership in physiology tenable at that School.

MR. CECIL WARBURTON, entomologist, formerly of the School of Agriculture and the Molteno Institute, University of Cambridge, who celebrated his hundredth birthday last year (see *Nature*, February 13, 1954, p. 289), was one hundred and one on February 6.

THE fourth World Petroleum Congress will be held in Rome during June 6–15. Further information can be obtained from the General Secretariat, Via Tevere 20, Rome.

AN International Symposium on Electrical Discharges in Gases will be held in the Technical University, Delft, during April 25–30. Further information can be obtained from A. W. van Wagensveld, Mijnbouwplein 11, Delft, Netherlands.

AN international conference on "Non-destructive Testing of Materials" will be held in Brussels during May 23–28. Further information can be obtained from the Secretary, l'Association des Industriels de Belgique, 29 Avenue André-Drouart, Auderghem, Brussels.

THE sixteenth General Assembly of the Fédération Internationale Pharmaceutique will be held in London during September 19–23. Further information can be obtained from D. F. Lewis, Pharmaceutical Society of Great Britain, 17 Bloomsbury Square, London, W.C.1.

A SUMMER school in programme design for automatic digital computing machines will be held in the University Mathematical Laboratory at Cambridge during September 12–23. Further information can be obtained from G. F. Hickson, secretary of the Board of Extra-mural Studies, Stuart House, Cambridge.

As already announced, the Fourteenth International Congress of Pure and Applied Chemistry is being held in Zurich during July 21–27. Registration for attendance must close on February 15. Correspondence should be sent to the Secretary-General, XIVth International Congress of Pure and Applied Chemistry, Zurich 1.

THE BIOLOGICAL COUNCIL: A PROGRESS REPORT

By Dr. W. P. K. FINDLAY

TEN years have now passed since the first moves were made to bring into being an organization that would enable British scientific societies in the biological field to collaborate in matters of mutual concern, and it may be of interest to survey what has been achieved in this direction

Many biologists had felt for some time that the activities of the specialized societies to which they belonged remained largely unknown to other biologists who happened to belong to different societies or associations, although often the activities of these other societies were of direct interest to them.

On the initiative of the Biochemical Society, representatives of some eight other societies attended an informal meeting on September 22, 1944, and agreed that steps should be taken to establish a co-ordinating committee consisting of representatives of the biological societies Thus the Biological Council came into being in July 1945, and in November of the same year, at a meeting held under the chairmanship of Sir Henry Dale, its officers were appointed and a programme of activities suggested (*Nature*, 156, 713 , 1945)

One of the first tasks undertaken was the preparation of an annual calendar containing information about the affiliated societies and the dates of their meetings This has appeared in one form or another each year since then, and has proved of great value to secretaries, who have thereby been able to avoid undesirable clashes in the dates of meetings of societies having similar interests.

In response to a demand from a number of biologists, a scheme was established in 1947 by which reprints of the titles of papers in the tables of contents of a group of journals were circulated soon after publication This scheme ran quite successfully for a number of years , but it was discontinued in 1953 owing to an inadequate number of subscribers

At the time when the Council was formed it was agreed that it should not concern itself with any professional matters affecting biologists themselves or their careers A sharp cleavage of opinion was revealed at the early meetings when this subject was raised by certain delegates, and at that time it would have been fatal to the success of the Council if professional matters had figured on its agenda. However, in 1946 the Association of British Zoologists invited the Council to consider the need for an Institute of Biology, and the Institute officially came into being as an independent organization on January 5, 1950 (*Nature*, 165, 131 , 1950) It was, however, felt that some continuing form of association between the two bodies was desirable and would lead to economies in the running of the Council business , so, in 1951, the Council became an advisory scientific committee to the Institute, which undertook to carry out the routine secretarial work of the Council. This arrangement has since worked well and to the mutual advantage of both bodies Following this reconstitution of the Council in 1952, Dr W P. K Findlay was elected chairman, Prof. F. L. Warren honorary treasurer, and Dr. J. L. Cloudesley-Thompson honorary secretary In 1954, Prof C T Ingold became chairman.

Societies the membership of which approaches four figures often find that the amount of routine secretarial work becomes too much for honorary secretaries to handle, and recently several such societies affiliated to the Council have arranged for this work to be carried out by the staff of the Institute The provision of such secretarial assistance in a central office was one of the original objects of the Council, and it is hoped that it will be possible to develop these facilities still further.

Several meetings have been held of the editors of the principal biological journals (including some that were not connected with the societies affiliated to the Council) to discuss problems of common interest Among proposals that were submitted to the Council at an early date was one suggesting some form of conjoint publishing bureau that would hold stocks of reprints and distribute them to individuals. This received little support, and it was at once clear that societies regarded the complete independence of their journals as an exceedingly important principle However, a number of useful suggestions were put forward at these meetings, on which action was afterwards taken. For example, many editors observed how much time had to be spent correcting literature citations in the manuscripts submitted to their journals, because these did not conform to the abbreviations given in the "World List of Scientific Periodicals". It was therefore decided that a selected list of the abbreviations of the titles of the biological journals to which reference is most frequently made should be prepared Mr. R W. Marsh, editor of the *Annals of Applied Biology*, kindly undertook this task and, with the co-operation of the "World List" authorities, a list was prepared and published in 1949, a second edition following in 1954

In 1947 the Keeper of the Science Library sought the assistance of the Council in obtaining the consent of its associated societies to permit photocopying of copyright papers published in their journals In general, a favourable response was forthcoming, and permission to reproduce photographically articles in all but the current issues was willingly accorded by most of the societies involved.

The poor delivery of scientific papers by inexperienced speakers often seriously detracts from their interest to the audience, so that accounts of fundamentally interesting work frequently do not receive the attention which they merit. Some "Notes for Speakers" were therefore prepared by the Biological Council in order to assist speakers at scientific meetings in the same way as "Instructions to Contributors" are issued to guide authors contributing papers to scientific journals These "Notes", which were first published in the *Annals of Applied Biology* in 1954, are available to members of the Institute of Biology and to members of affiliated societies

An obvious duty of the Council is to promote joint discussions between societies and groups of biologists who are interested in similar problems in related fields. The Council welcomed an invitation in 1951 from the Fine Chemicals Group of the Society of Chemical Industry to co-ordinate symposia on drug action, and a committee, under the chairmanship of Sir Charles Harington, was set up for this purpose. A number of highly successful symposia on subjects such as "Anticholinesterases", "Chemotherapy of

Tuberculosis" and "Insecticides" have already been held

The Council has been consulted on a number of occasions regarding various aspects of the teaching of biology, such, for example, as the teaching of human biology in schools, and it was asked to nominate a representative to serve on a national board to consider the recruitment and training of laboratory technicians

Many other minor matters have been dealt with by the Council, but perhaps one of the most important incidental benefits which members have derived from attendance at its meetings has been the personal contact between the officers of various societies and associations

---

MEDICAL RESEARCH LABORATORY OF VOJVODINA, NOVI SAD, YUGOSLAVIA

By Dr P. SCHWARZ

Director

IN 1947 it was announced in these columns[1] that a Yugoslav State laboratory was to be founded in Novi Sad, with the task of dealing with problems of experimental biology and medicine. For certain administrative reasons the laboratory was transferred to Belgrade, and the director, Dr. P. Martinovitch, continued his research in the Boris Kidritch Institute of Nuclear Science, where there were convenient facilities for carrying out his work. The premises in Novi Sad and a part of the fittings and apparatus were taken over by a newly founded bacteriological and serological laboratory under my leadership, and the whole organization was named the Medical Research Laboratory of Vojvodina This new Laboratory has fixed research tasks, and its budget is financed by the State.

Novi Sad is a relatively small town of 86,000 inhabitants, but notwithstanding is the cultural and administrative centre of a rather large territory containing about eight hundred medical practitioners. The idea arose that scientific research work should not be the privilege of a fortunate few, exclusively employed for this purpose in well-equipped laboratories with undisturbed working possibilities, the ordinary medical practitioner often has a creative idea, and it was proposed that an organization should be established with the task of preserving creative ideas and not letting them fall into oblivion. The state of medical conditions in Yugoslavia makes it imperative that this help should be given so as to develop ideas which are in close touch with practical questions of health and sanitation

The Laboratory has therefore been created in two parts one is the bacteriological and serological laboratory already mentioned, with full-time workers who are allotted research tasks, and the other is the 'service laboratory', where part-time laboratory workers are employed, with the task of helping physicians who are working out their ideas in their spare time The management of the Laboratory investigates whether the idea is original, whether it has some relations to practical sanitary questions and whether the Laboratory is able, taking into account limitations of staff and finance, to help in carrying out the research In the service department of the Laboratory the following part-time workers are employed a pathologist, a bacteriologist, a hæmatologist, a biochemist, and a surgeon for carrying out operations on experimental animals Besides these, the Laboratory employs assistants for part-time work according to the necessity and nature of the work. The above-mentioned sections are in the process of being formed and are at present only very modestly equipped, among other things, it is very difficult to get hold of medical publications and the periodical literature It might be thought that, under such conditions, it is a mistake to undertake such a job and that it would be better to wait until matters improve. But to do so would be to risk losing ideas and losing the collaboration of ambitious young workers, and this would be an even greater mistake, so we have decided to work under the present conditions, even at the risk of publishing something in ignorance of the fact that the same work has been published elsewhere by others.

The Laboratory has proved to be an active organization, for since the time of its functioning in 1951 eight research workers have asked for help from its laboratory service and have worked on the following topics, publishing them in the Yugoslav medical press and also partly in foreign periodicals the mechanism of blood clot retraction[2], the determination of the value of the thrombocytes with regard to their function in blood clot retraction[3], the determination of the serum protein fractions with the aid of salting out with ammonium sulphate[4], the fractionation of beef heart extract[5], new methods of making serial dilutions with small gradations[6], new methods for adjusting colloidal gold solutions and carrying out the colloidal gold test[7], the nature of the process of fibrinolysis and the products of the decomposition of the fibrin[8], serum proteins in pregnant women[9], the estimation of blood plasma clotting and the relation of the calcium concentration to the first and the second phase of blood coagulation[10], the therapy of miscarriage with histamine[11], the finding of enhanced sensitivity of some *Salmonella* strains to bismuth and the prescription of a modification of the Wilson–Blair medium for the elimination of the inhibitory power of bismuth (balanced sulphite agar)[13], experimental hyperfolliculinemy in dogs[14], and experimental eclampsia in dogs[15] Nearly all the papers enumerated in refs. 2–15 are written in Yugoslavian, but a translation or detailed summary will gladly be sent if requested. Besides these published papers, the following research problems have been registered at the Laboratory and are still under investigation the disturbances of the antihæmorrhagic mechanism in dogs injured by X-rays, the nature of the *S* factor of blood clot retraction, contribution to the pathogenesis of eclampsia, the investigation of the effect of the liver on œstrogen metabolism, the changes arising in the antihæmorrhagic mechanism caused by folliculin, the effect of cation combinations of the sulphite-reducing micro-organism, experiments on the quantitative estimation of the accessory growth factor, the effect of artificial hibernation on the incubation of some virus diseases.

The full-time part of the Laboratory has worked out experimentally the possibility of preparing desiccated culture media and has prepared an extract for the Meinicke clarification test. As a result of these investigations, the Laboratory has prepared a rather good desiccated Wilson–Blair agar on a small scale and, in addition, has furnished most of the *M*-antigen used in Yugoslavia

I do not know whether such an organization exists elsewhere, and I should be very grateful for any relevant information If this form of a research organization is a new one, its existence could, in my opinion, be explained by the special conditions of medicine prevailing in Yugoslavia on one hand, by the great demand for medical aid, which means that medical practitioners are very much preoccupied by routine medical work, and, on the other, by their desire for extending their medical knowledge This overtime work has proved a great stimulus, and furthered their interest in their profession

THE BRITISH GELATINE AND GLUE RESEARCH ASSOCIATION

RESEARCH PANEL MEETING

THE ninth meeting of the Research Panel of the British Gelatine and Glue Research Association was held on December 9. Mr S G Hudson (Messrs Richard Hodgson and Sons, Ltd) was in the chair Three papers were presented, each being concerned with a major item of the research programme of the Association

Dr. J. E Eastoe in his paper, "Gelatin as a Chemical Compound", described the stages which must be followed in elucidating the chemical structure of proteins These include elemental analysis, amino-acid analysis, determination of amino-acid sequence, and also those aspects of the configuration of the intact protein, apart from sequence, which are affected by hydrolytic conditions The second of the stages was the basis of the work which was being reported The experimental method used was the chromatographic technique of Moore and Stein, using the ion exchange resin 'Dowex 50'[1], carried out almost exactly in accord with the original paper. This enabled all but one of the amino-acids present in gelatin or collagen to be estimated by means of two chromatographic experiments, one using a ong column of resin, and a second run in which a short column was used for the estimation of the basic amino-acids These are not given accurately with the long column The remaining acid to be estimated, hydroxyproline, was determined by the colorimetric method of Neuman and Logan[2] in preference to carrying out a third chromatographic separation

The method of analysis has been applied to a selection of gelatins and collagens of mammalian origin, and is also being extended to fish materials The general conclusions were that the results as a whole showed very satisfactory agreement with the determinations, by a number of methods, for gelatin by Chibnall and co-workers[3,4], and for collagen[3-5], for which Bowes and Kenten had also carried out careful analyses. The results for the whole range of materials also agreed well with the microbiological determinations of Neuman[6] The differences between the results for all the mammalian gelatins and collagens studied, with the exception of the content of amide nitrogen, and the ratio ornithine/arginine, were generally so small that they might result from small quantities of impurities The two exceptions arise not from differences in the native tissues, but from the effect of manufacturing processes The differences between mammalian and fish collagens, particularly in regard to the hydroxy amino-acids, confirm previous results[6].

Dr. A W Kenchington in his paper, "Gelatin Derivatives and their Properties", said that he had attempted to modify in turn all the more important polar groups of the gelatin molecule The behaviour of methylated gelatins, in which the carboxyl groups have been esterified with methanol in the presence of hydrochloric acid, had already been reported[7] The amino-groups were acetylated using acetic anhydride in the presence of sodium acetate The comparison of the degree of substitution, estimated by acetyl determination, and by measurement of the number of unreacted amino-groups by the titration curve method[8], showed that at low degrees of substitution only the amino-groups had reacted At higher degrees of substitution there was evidence of acetylation of hydroxyl groups also

The number of guanidino-groups of gelatin was increased by means of the reaction between the amino-groups and *o*-methyl isourea Almost quantitative reaction was produced, as shown by the technique of Moore and Stein[9], the lysine and hydroxylysine residues becoming homoarginine and hydroxyhomoarginine respectively Removal of the guanidino-groups by means of alkaline hypobromite, although effective for this purpose, also caused some degradation of the polypeptide chain

Mr P R. Saunders, in a paper on "Degraded Gelatins their Properties and Structure", described the effect of degradation in solution brought about by heat, extremes of *p*H, ultrasonics, and hydrogen peroxide The physical properties of the degraded gelatins which were measured included viscosity in both concentrated and dilute solutions, and gel rigidity over a range of temperatures from 0° C to near the melting point It has been established by this work that degradation can both reduce the mean molecular weight of the gelatin and also destroy to a greater or less extent an intrinsic power of gelling This point has been verified by fractionation of the degraded gelatins according to molecular weight

A general discussion on the gelling of gelatin was opened by Mr. A G Ward, director of research of the Association A G WARD

STATISTICS OF WINDFALLS AND DISASTERS

AN admirable little book, on the "Statistical Theory of Extreme Values and Some Practical Applications"*, presented in a vigorous and attractive style by one who has contributed extensively to the subject, has been written by E J. Gumbel and published by the United States National Bureau of Standards in its Applied Mathematics Series Suppose we have n independent observations x_1, x_2, , x_n, with a common distribution-function

$$F(t) \equiv \text{prob}\,\{x \leqslant t\}$$

Then, if y_1, y_2, ., y_n are the same n observed numbers re-arranged in descending order of magnitude, the largest value y_1, the smallest value y_n and the range $y_1 - y_n$ are three new random variables the joint distribution of which will depend on the distribution-function F with which we started. It is usual in statistical problems to have to make simplifying assumptions about the initial distribution before progress is possible In the history of the theory of extreme values we see an interesting reversal of this general rule, the characteristic features of the theory as it exists to-day did not emerge until special assumptions about the initial distribution (for example, that it was 'normal') were abandoned and instead attention was concentrated on whole classes of initial distributions giving rise to a common asymptotic behaviour of the distribution of y_1 The work of Fréchet in 1927 and of Fisher and Tippett in the following year revealed three forms of asymptotic behaviour for the distribution of y_1, when n is large, each being associated with a different class of initial distributions The assignment of a distribution to the correct class depends on the behaviour of $F(x)$ for large positive x and so not on the features of the initial distribution which normally strike one as the most important For example, the negative-exponential distribution,

$$F(x) = 1 - \exp(-x) \quad (x \geqslant 0), \qquad (1)$$

and the 'normal' distribution,

$$F(x) = \frac{1}{\sqrt{(2\pi)}} \int_{-\infty}^{x} \exp(-\tfrac{1}{2}t^2)\, dt \; (-\infty < x < \infty), \qquad (2)$$

belong to the same class If we restrict attention to (1), we can easily obtain a selection of results illustrating the general theory

Let y be the largest value in a sample of size n, ($F(x)$ being given by (1)), and let $y = z + \log n$. Then

$$G(u) \equiv \text{prob}\,\{y \leqslant u\} = \text{prob}\,\{\text{all } x_i \leqslant u\} = [1 - \exp(-u)]^n,$$

and

$$H(v) = \text{prob}\,(z \leqslant v) = G(v + \log n) = \{1 - \frac{1}{n}\exp(-v)\}^n$$

$$\rightarrow \exp\{-\exp(-v)\} \text{ as } n \rightarrow \infty$$

Thus for the reduced largest value z we obtain the asymptotic distribution,

$$\exp[-\{z + \exp(-z)\}]\, dz \quad (-\infty < z < \infty), \qquad (3)$$

valid when n is large. The distribution (3) has zero mode, a mean of $\gamma = 0\ 577$ (Euler's constant) and a standard deviation of $\pi/\sqrt{6}$. Analogous results hold when the initial distribution is of the 'normal' form, it is only the method of reducing the variable which must be altered.

The fact that

$$E\,\{\text{largest value}\} \simeq 0\ 577 + \log n \qquad (4)$$

for the distribution (1) (other distributions in the same class giving rise to similar formulæ) explains an empirical law discovered by W. E. Fuller the size of the largest flood increases linearly with the logarithm of the period of observation.

This brings us to the applications It will be obvious how a careful use of the theory supplies a rational approach to the old problem of 'the rejection of outlying observations', but more interesting are the situations in which the extreme values are themselves the principal objects of study, instead of being merely awkward facts which one would like to ignore Two such situations will be mentioned here, they are selected from many A flood is defined in the present context as the largest daily discharge of a given river in a given year It is thus the largest value in a sample of size $n = 365$ (or 366) members The lack of independence between daily discharges may, to a first approximation, be allowed for by assuming the weekly floods to be independent, so that $n = 52$ The effect of seasonal variations is less obvious, but the use of distributions such as (3) to describe the observed annual floods of rivers like the Mississippi has proved very successful and has been found of great value in dam design. A second application of particular interest is one which is currently being made to the study of the breaking-strengths of materials. ("No chain is stronger than its weakest link") In general, this work should interest all those who are concerned with the application of this sort of statistics to such problems as the breakdown of capacitors, the breaking strength of yarn, extinction times for bacteria, gust velocities in thunderstorms, the vagaries of the climate (and the stock market) and the occurrence of centenarians

AN INTRODUCTION TO THE

BIOLOGY OF YEASTS

By M INGRAM, M A , Ph D

This book describes what the yeasts are and what they do It begins with an introductory chapter describing the general nature of yeasts, and then deals with the simpler and the more complex metabolic processes A section is devoted to the process of growth and reproduction, and the book closes with an account of the behaviour of the yeast colony and its place in nature Illustrated with line drawings and photomicrographs 25/- net

Guide for Safety in the Chemical Laboratory

This book sets forth in detail recommended safety procedures for the storing, handling and use of chemicals in every form It is up to date in every way and covers, among other things, radioactive materials. It should be kept as a guide and ready reference wherever chemicals are used 32*s.*

Advanced Level Examples in Physics

R V JOHNS, M A , B Sc

Lecturer in Physics and Mathematics, City of Liverpool College of Technology

W. F WARE, B Sc , A.Inst P

Senior Physics Master, Cathays High School for Boys, Cardiff

This book of numerical examples is designed to supplement the theoretical and laboratory work of students preparing for examinations in Physics at the Advanced level of the General Certificate of Education and for Intermediate Degree examinations Some 1,000 examples have been arranged by topics and carefully graded in difficulty Contents are arranged under the headings Mechanics and Properties of Matter, Heat, Light, Sound, and Magnetism and Electricity 16*s*

Functions of a Complex Variable

THOMAS M MACROBERT, M A., D Sc

Professor of Mathematics in the University of Glasgow

This book is designed for students who, having acquired a good working knowledge of the calculus, desire to become acquainted with the theory of functions of a complex variable, and with the principal applications of that theory In order to avoid making the subject too difficult for beginners, the author has abstained from the use of strictly arithmetical methods *Fourth Edition* 20*s*

Hilger Micro-focus X-ray Unit

Incorporating the Ehrenberg & Spear Tube

The Micro-focus Unit, with its small but extremely intense source spot, is primarily designed for diffraction work. it may also be used for micro-radiography Among its many advantages are

1) Reduced exposure times.
2) Direct X-ray magnification up to ten times, which may be supplemented by optical enlargement of the radiographs
3) Provision for use of vacuum cassette techniques for the examination of semi-transparent tissues
4) Exceptionally small focal spot (0 04 mm approx diameter)
5) Working potential between 5 and 50 kV ; tube supply is smoothed half wave
6) A range of easily interchangeable targets gives a wide choice of X-radiation
7) X-ray diffraction cameras for use with the unit are of smal diameter

Please write for Micro-focus catalogue CH 356 (*N*2) *and Cameras catalogue CH* 382 (*N*2)

to aero-engines was closed down and the Institute now consists of five research branches with a senior scientific staff of five professors and five assistant professors

In the latest issue of the Reports of the Institute of High-speed Mechanics (5, No 41, 1954) a descriptive report of the historical development and of the present research activities is given, together with details of the personnel and government of the Institute. Most of the original buildings, with the exception of the workshop and underground water tank of the hydraulic laboratory, were destroyed during air raids, but reconstruction was commenced after the War and the main Institute building, together with a three-story reinforced concrete building with floor area of 10,670 sq ft and a connecting building of 2,670 sq. ft, have been erected These buildings house the heat, air, fatigue and vibration laboratories in addition to the administrative and workshop facilities.

The names of the various members of staff together with their subjects of research are listed in the report and details of the available research and workshop equipment are given The research topics are mainly concerned with cavitation tests on hydrofoil profiles, high-speed water turbines and axial flow pumps. Recent work on gas turbines is to be extended, and it is hoped to revive the research branch on thermal fluid-dynamics An impressive list of the titles of the scientific articles published by members of the staff of the Institute since 1949 and included in the report bears evidence of the steadily worthwhile results obtained both in the academic and applied fields of research at the Institute

SOURCES OF GERMANIUM IN GREAT BRITAIN

By R. H. A CRAWLEY

Research Laboratories, British Thomson-Houston Co, Ltd, Rugby

GERMANIUM is an element of increasing interest, particularly for the manufacture of a variety of semiconductor devices by the electrical industry At the present time, germanium in Great Britain is obtained almost exclusively from gas-works flue dusts[1] Most British coals, except those from South Wales, contain small amounts of germanium[2], and we have therefore considered the possibility that useful concentrations of germanium might be found in the industrial plants of other large coal users

Samples from the British Electricity Authority The British Electricity Authority is the largest single user of coal in Britain. We believe that analyses have been made by other workers of deposits and flue dusts from various plants of the Authority, but few results have so far been published We have examined many samples of deposits and flue dusts and some typical results are shown in Table 1 The method of examination used was, with minor modifications, that described by Cluley[3]

It will be seen that a number of the superheater and economizer deposits show an appreciable concentration of germanium, but the flue dusts show only low concentrations The quantities of enriched deposits available vary widely from plant to plant, and, moreover, it is not always possible because of the structure of the plant to recover all the deposit potentially available Nevertheless, this source of germanium should repay further investigation.

Table 1 Germanium Content of Power Plant Residues

Source	Description	Germanium (per cent)
Northampton (East Midlands Division)	Economizer deposit	0 12
	Superheater deposit	0 05
	Deposit on last row of boiler tubes	0 14
Spondon (East Midlands Division)	Fly ash from bottom generator bank	0 014
	Bonded deposit from bottom generator bank	0 13
	Deposit on superheater tubes	0 09
	Deposit on upper generator bank	0 22
	Deposit on upper generator bank (different position)	0 28
	Deposit on economizer tubes (top)	0 14
	Deposit on economizer tubes (bottom)	0 05
Bolton (N W Division)	Deposit on bottom bank of generator tubes	0 025
	Deposit on bottom row of superheater tubes	0 09
	Economizer deposit	0 05
Trafford Park (N W Division)	Generator deposit	0 03
	Economizer deposit	0 06
	Superheater deposit	0 065
Halifax (Yorkshire Division)	Flue dust at chimney base	0 012
	Flue dust—air heater hoppers	0 005
	I D fan grit collectors	0 005
Bradford (Yorkshire Division)	Cyclone grits	nil
	Economizer grits	0 005

Gas Works Tar Although the largest concentration of germanium in gas works is found in the flue deposits of the producer-gas plant, we thought it worth while to examine the possibility of recovering germanium from tar or liquor, particularly in view of a report from Japan that a process has been developed there for recovering germanium from gas-works liquor With the co-operation of the Midland Tar Distillers, we examined a sample of tar which was representative of tar obtained from a number of gas works in the Midlands, it was found to contain 3–4 parts per million of germanium Also with the co-operation of the Midland Tar Distillers, we have examined the source of the germanium during tar distillation, with the results shown in Table 2. The method of examination again follows that described by Cluley, except that the tar is first ignited at 450° in air to remove the bulk of the organic matter If 450° is not exceeded, it has been shown that no germanium is lost by volatilization

It is evident that the germanium is entirely retained in the pitch fraction. Now the pitch normally contains about 0 2–0 5 per cent of ash, so that taking a figure of 10 parts per million of germanium in the pitch and assuming that all this would be retained in the ash, one might expect a germanium content in the ash of about 0 2–0 5 per cent.

A considerable quantity of pitch is burned as fuel, and we have therefore examined several flue dusts from a number of pitch-burning plants Typical

Table 2 Tar Distillation Distribution of Germanium

Crude tar, before distillation		3 4 p p m
Distillate fraction No 1	Up to 210° C	Nil
No 2	210°–250° C	Nil
No 3	250°–300° C	Nil
No 4	300°–350° C (approx)	Nil
Pitch Sample No 1 (continuous distillation)		11 5 p p m
No 2 ,, ,,		7 8 p p m
No 3 (pot still pitch)		6 4 p p m
Residue in pre-flash column		Nil
Residue at base of fractionating column		Nil

Table 3. GERMANIUM CONTENTS FOR RESIDUES FROM PITCH-BURNING PLANTS

The Midland Tar Distillers	
Flue dust from Babcock boiler	0.045 (high carbon content)
Firm using the Midland Tar Distillers fuel	
Flue dust from pitch-creosote burning plant	0.15
Dorman Long	
Flue dust—back flue	0.28
,, front flue	0.24
Boiler flue dust	0.21
Economizer flue dust	0.10

results are shown in Table 3, and the germanium contents are of the order expected. It is evident that these dusts constitute a potentially valuable source of germanium.

Other Coal-using Industries. Steel works consume large quantities of coal, and in a private communication from Mr. C. C. Gegg, of Thomas Firth and John Brown, Ltd., useful concentrates of germanium (up to 0.4 per cent) have been reported in flue dusts. A smaller quantity of coal is burned in the glass industry, and in this case we have found germanium in quantities up to 0.3 per cent in the flue dusts. Unfortunately, it appears that the amount of germanium-rich dust available from the latter source is negligibly small.

Acknowledgment is due to the British Electricity Authority, the Midland Tar Distillers, Thomas Firth and John Brown, Ltd., and Dorman Long and Co., Ltd., for their co-operation in this investigation; to Mr. J. E. Stanworth and Mr. J. V. Hardwick for helpful discussion; and to Mr. L. J. Davies, director of research, British Thomson-Houston Co., Ltd., for permission to publish this communication.

NITRIFYING ORGANISMS IN GLASSHOUSE SOILS

By DR. R. KLEIN

Glasshouse Crops Research Institute, Cheshunt, Herts

IN the course of investigations on the problem of nitrification in steam-sterilized glasshouse soil, suggested by Dr. W. F. Bewley, director of the Experimental and Research Station, Cheshunt, it was considered necessary to study the activity of the nitrifying organisms in pure culture and the possibilities of their improvement in pure and mixed (crude) cultures before trying to reconstitute the association soil + nitrifiers. Since it was not possible to obtain pure cultures from sources in Britain or abroad, the isolation of these organisms had to be attempted as the first step in this work.

The preliminary work comprised among other experiments the separation of *Nitrosomonas* and *Nitrobacter*, the use of silica gel plates which can be prepared without the tedious process of dialysing, the inoculation of these plates by streaking (according to various writers silica plates cannot be inoculated by streaking because water oozes out into the streaks), the use of antibiotics for purification of the nitrifiers, and the maintenance of the pure and the crude cultures under mineral oil; it is not yet known whether the presence of other soil bacteria has an effect on the nitrification in the soil, and it might be necessary to use crude cultures for the above-mentioned reconstitution.

The present account is concerned with only one part of this work. Although Winogradsky[1] mentioned that Boullanger and Massol[2] tried various ammonium compounds instead of ammonium sulphate and found that ammonium borate gave good nitritation, he kept to the use of the sulphate in the medium for *Nitrosomonas*, and this medium has been used as a standard medium, sometimes with minor modifications, by all workers in this field. I had experienced the favourable effect of borates in microbiological work of a different type and was, therefore, interested to find out how the nitrifiers would react to them.

The cultures used were *Nitrosomonas* sp. and *Nitrobacter* sp. isolated from glasshouse soil, separated and partly purified. The first experiments of this kind were made with F_{16}, and subcultures in 1-in. boiling-tubes were used to save incubator space. These boiling-tubes were kept in wire baskets in a sloping position to reduce the depth and enlarge the surface of the liquid medium.

In the work with *Nitrosomonas*, ammonium sulphate in Winogradsky's medium was replaced by ammonium borate, keeping the nitrogen contents at about the same level. No attempt was made to determine the optimum amount of ammonium borate, and owing to the limited incubator space some experiments had to be carried out at 25° C. instead of 30° C. The different temperatures probably require different amounts of ammonium borate. The cultures were tested on spotting plates, with Nessler's reagent for ammonia and with Trommsdorf's reagent for nitrite.

The experiments were repeated several times, always with three different series of cultures, which apparently represented three different strains, and set up in duplicate. A typical example is shown in Table 1.

Table 1 shows clearly that, under the conditions of the experiment, the ammonia disappeared more rapidly and the nitrite was formed more quickly in the cultures with ammonium borate. Since only spot tests were used for examining the course of the nitritation and no quantitative determinations were made, it is not possible to say whether the whole of the ammonia was oxidized to nitrite. The colour tests give only a relative picture, and their evaluation depends on my personal impression. Yet from the numerous tests, I believe that the appearance and increase of the nitrite in the ammonium borate cultures were sometimes slower than the disappearance of the ammonia, that is, there is a much greater difference between sulphate and borate cultures as regards disappearance of ammonia than as regards appearance of nitrite. It is possible that the degree of contamination has an effect, and some organisms other than *Nitrosomonas* might use up part of the ammonia in the borate cultures more quickly than in the sulphate cultures. Whether this is the case can only be found out by comparison of the activities of *Nitrosomonas* in mixed cultures and in pure cultures.

It was probably the metabolic activity of the accompanying soil bacteria that caused the discrepancy in a series of experiments with soils from Littlehampton. Three soils were used: a field-soil (*L/FS*), a manured (*L/B*), and a manured and

NR, Nessler's reagent the strongest reaction of the medium before inoculation was marked ++++
TR, Trommsdorf's reagent a trace of nitrite is marked (∓), full nitritation is 6

fertilized (*L/D*) glasshouse soil The crude cultures were made with ammonium sulphate medium Then transfers F_1 were made into ammonium sulphate and ammonium borate media and afterwards from sulphate cultures F_1 into sulphate medium and from borate cultures F_1 into borate medium, the two series being continued without cross-transfers from one kind of medium into the other As regards disappearance of the ammonia, the picture was always the same. It decreased in all three series considerably more rapidly in the ammonium borate cultures Yet as regards the formation of nitrite, the cultures from the three soils behaved differently In the borate cultures of *L/FS*, the formation of nitrite was for some time insignificant, and was increased only when, after the disappearance of the ammonia, another dose of ammonium borate was added But the nitrite contents never reached the same level as in the other cultures This discrepancy might perhaps be overcome by altering the quantitative composition of the medium In the *L/B* cultures the formation of nitrite was slower in the borate cultures than in the sulphate cultures, but reached eventually the same peak Yet in the *L/D* cultures the formation of nitrite lagged behind in the borate cultures of F_1, but from F_2 onwards it was faster than in the sulphate cultures

Experiments with *Nitrobacter* cultures from glasshouse soil at Cheshunt showed that this organism is very susceptible to boron, whether given as boric acid or sodium borate It was therefore of interest to keep the *Nitrosomonas* cultures made from the Littlehampton soils, after the whole of the ammonia had been oxidized to nitrite, and to test them again after an interval The results were quite interesting. The F_1 cultures were tested after about a month. In the ammonium sulphate cultures, the nitrite had almost completely disappeared, and diphenylamine–sulphuric acid gave strong reactions for nitrate, a few days later there was no trace of nitrite to be found The transformation of the nitrite to nitrate had apparently commenced much earlier, the beginning, however, could not be dated, since there was a comparatively long interval between the two critical tests, the one when nitrites were at their peak and the other one when scarcely any nitrite was detectable The ammonium borate cultures, however, with the exception of the *L/FS* cultures, gave always strong nitrite reactions, and when the experiment was concluded—the cultures were then more than two months old—they still did not show any change

In the tests of F_2, long intervals were avoided and it was therefore possible to find that the oxidation of nitrite to nitrate in the sulphate cultures started very early. In the cultures of *L/D*, the nitrite had disappeared in less than three weeks from the inoculation date, in *L/FS* and *L/B* cultures it took a little longer But again the ammonium borate cultures, after complete nitritation, remained unchanged, and even after seven weeks there was no decrease in the nitrite contents. As in F_1, the *L/FS* cultures with ammonium borate were here an exception, too.

Some *L/B* cultures did not show any decrease of their nitrite contents, a sign that there was no *Nitrobacter* present. It can always happen that the transfer of a mixed *Nitrosomonas–Nitrobacter* culture into a *Nitrosomonas* medium results in a *Nitrobacter*-free culture when the latter organism is weak or present only in very small numbers. Usually, however, it takes a fair number of transfers to obtain *Nitrosomonas* cultures free from *Nitrobacter*. Meiklejohn[3] still found nitrate production in the twenty-fourth successive transfer. The replacement of ammonium sulphate by ammonium borate can be used not only to achieve speedier nitritation but also to rid the *Nitrosomonas* cultures of *Nitrobacter* at an early, perhaps even at the first, transfer.

Owing to the imminent move of the Experimental and Research Station to Littlehampton, this work will have to be discontinued for the time being, and a preliminary report of it will be published elsewhere [Nov 25

POSITION AND REACTIVITY OF THE HISTIDINE RESIDUES IN CYTOCHROME *c*

By DR. E MARGOLIASH

Molteno Institute, University of Cambridge, and Department of Experimental Pathology, Hebrew University, Jerusalem

THE position of the histidine residues in the cytochrome c molecule has been of interest since Theorell and Åkesson[1] put forward the suggestion that the imidazole groups of two histidines are the groups co-ordinating with the iron atom of the cytochrome c hæm, in positions 5 and 6, thereby producing the hæmochromogen type of spectrum of the protein These authors used a beef heart cytochrome c preparation containing 0 43 per cent iron. Their evidence was that, of the three histidine residues in the molecule, only one had an imidazole group which could be titrated in the pH range 5·5–8·5[2], the other two being presumably co-ordinated with the hæm iron.

Paul[3] showed that, on treating beef heart cytochrome *c* with 1,2,4-fluorodinitrobenzene, only 0·47 out of the three histidines did not form dinitrophenyl derivatives, as calculated from determinations of free histidine after complete hydrolysis of the dinitrophenylprotein. The free histidine was determined using a bacterial decarboxylase which reacts with histidine only if the imidazole, α-amino and carboxyl groups are unsubstituted.

Following the purification of cytochrome *c* on columns of cation exchangers, preparations containing 0·465 per cent iron could be obtained[4,5]. With these preparations the reactivity of the histidines was re-investigated using the more direct fluorodinitrobenzene method developed by Sanger[6].

Oxidized cytochrome *c* was prepared by treating the protein in water with hydrogen peroxide, precipitating the oxidized material with ten volumes of acetone in the cold and taking it up at once in water. Histidine was determined by the Pauly reaction according to Macpherson[7], after elution from paper chromatograms developed with the butanol – formic acid solvent of Acher and Crocker[8]. Imidazole mono-dinitrophenylhistidine was synthesized according to directions kindly provided by Dr. F. Sanger. α-Acetylhistidine[9] was treated with fluorodinitrobenzene and the α-acetyl imidazole mono-dinitrophenylhistidine obtained was hydrolysed in boiling 20 per cent hydrochloric acid. The product recrystallized from acetic acid was colourless. It migrated on butanol – formic acid paper chromatograms as a well-defined spot with a faint preceding trail of material. When dry, the spot darkened gradually in the light over a period of 5–10 days. Since the imidazole ring is rather labile when substituted, it may be that in this synthetic product the ring had opened. However, since the synthetic imidazole dinitrophenylhistidine was chromatographically identical with that obtained from dinitrophenyl cytochrome *c*, it must be supposed that if the ring had opened in the synthetic material it had done so also during the procedure with the protein, thus not affecting the argument. On the other hand, since alkaline hydrolysis of the synthetic imidazole dinitrophenylhistidine yielded some free histidine showing a positive Pauly reaction[10], at least part of the original product had an intact imidazole ring. Imidazole dinitrophenylhistidine was estimated by titration with titanous chloride[11] after elution with 35 per cent acetic acid in water from butanol – formic acid chromatograms. The identity of the material obtained from dinitrophenyl cytochrome *c* was confirmed by hydrolysing it with concentrated ammonia solution in a sealed capillary tube, and identifying the free histidine produced both chromatographically and by the Pauly reaction according to Sanger and Tuppy[10].

α-Amino mono-dinitrophenylhistidine was identified as a reddish-yellow spot which gave a positive Pauly reaction and a negative ninhydrin test on butanol – formic acid paper chromatograms of hydrolysates of dinitrophenyl cytochrome *c*. On such chromatograms it had an R_F value of 0·09 as compared with 0·02 for free histidine, 0·16 for imidazole dinitrophenylhistidine and 0·63 for *bis*-dinitrophenylhistidine. Several attempts to synthesize α-dinitrophenylhistidine resulted only in mixtures containing approximately equal amounts of imidazole dinitrophenylhistidine and α-dinitrophenylhistidine. Therefore, the identity of the presumed α-dinitrophenylhistidine obtained from dinitrophenyl cytochrome *c* was confirmed indirectly. It could be shown that when the material corresponding to the presumed α-dinitrophenylhistidine on a butanol – formic acid chromatogram of a hydrolysate of dinitrophenyl cytochrome *c* was eluted and treated with an excess of fluorodinitrobenzene under the usual conditions, it was transformed into *bis*-dinitrophenylhistidine, which was identified both by paper and column chromatography as described below. α-Dinitrophenylhistidine was routinely estimated by titration with titanous chloride[11] after elution from butanol – formic acid chromatograms with 35 per cent acetic acid in water.

Bis-dinitrophenylhistidine was determined spectrophotometrically after separation from other dinitrophenyl derivatives present in the continuous ether extract of hydrolysates of dinitrophenyl cytochrome *c*, on an ammonia-activated kieselguhr column according to Mills[12]. Its concentration in this continuous ether extract could also be calculated from the optical density of the extract at four selected wave-lengths (240, 290, 320 and 350 mμ), taking into account the extinction at these wave-lengths of the only four compounds in the extract, namely, *bis*-dinitrophenylhistidine, dinitroaniline, dinitrophenol and traces of ε-amino mono-dinitrophenyllysine. The four equations with four unknowns obtained could be solved for the concentration of any one of the compounds desired. The identity of the *bis*-dinitrophenylhistidine was further verified on paper chromatograms developed with tertiary amyl alcohol saturated with phthalate buffer pH 6, according to Blackburn and Lowther[13].

All results were calculated as moles per mole of cytochrome *c* iron, as determined spectrophotometrically and also directly by the dipyridyl method according to Keilin and Hartree[14]. The results were corrected for the destruction of the dinitrophenyl amino-acids during hydrolysis in the presence of cytochrome *c*.

Using a chromatographic fraction I[5] of horse heart cytochrome *c* containing 0·465 per cent iron (native, fully enzymically active protein) and carrying out the reaction with fluorodinitrobenzene in 66 per cent ethanol[6] for relatively short periods, the histidines were recovered as follows: 1 mole of *bis*-dinitrophenylhistidine, 1 mole of imidazole dinitrophenylhistidine, and somewhat less than 2 moles of free histidine. Determinations of histidine following hydrolysis of the original preparation of cytochrome *c* confirmed that horse heart cytochrome *c* contains four moles of histidine per mole of iron, rather than the three moles found in the beef heart preparation[1]. When the reaction with fluorodinitrobenzene in 66 per cent ethanol was continued for relatively long periods, there was a gradual disappearance of one of the histidine residues, which had previously been recovered as free histidine. This residue could then be accounted for as α-dinitrophenylhistidine. The second histidine residue, which was usually recovered as free histidine, could not be made to react even after prolonged periods of contact with fluorodinitrobenzene in 66 per cent ethanol under the usual conditions. When oxidized cytochrome *c* was used, nearly 2 moles of *bis*-dinitrophenylhistidine, 1 mole of imidazole dinitrophenylhistidine,

Table 1

Cytochrome *c* preparation	Reaction with FDNB Medium	Time (hr)	Moles/mole of cytochrome *c* iron Histidine	Im DNP histidine	α-DNP histidine	*Bis*-DNP histidine	ε-DNP lysine
Fraction I	—	—	4.05	—	—	—	—
Dinitrophenyl fraction I	Water	4	1.88	1.00	0.11	0.81	13.8
Dinitrophenyl fraction II	66 per cent ethanol	1	1.69	0.90	0.38	1.13	21.1
Dinitrophenyl fraction II	66 per cent ethanol	6	0.97	1.09	0.99	1.08	19.6
Dinitrophenyl fraction II	66 per cent ethanol	24	0.96	1.01	0.91	0.93	20.0
Dinitrophenyl oxidized cytochrome *c*	66 per cent ethanol	24	1.01	0.92	0.26	1.86	16.7

1 mole of free histidine and very little α-dinitrophenylhistidine were recovered.

In conclusion, it can be stated that one histidine residue is a normal amino end-group of cytochrome *c*, another histidine has a normally reactive imidazole group, while the last two histidine residues have unreactive imidazole groups. One of the latter histidines has a slowly reacting α-amino group and an imidazole group which reacts only after the protein is oxidized. Thus it represents an amino end-group of the protein with an attached imidazole group, the latter being liberated only after a drastic treatment which, together with other effects, destroys the cytochrome *c* hæm. The second unreactive histidine could not be made to react at all under any of these conditions.

Ethanol in the same concentration and under the same conditions as usually used for the reaction of fluorodinitrobenzene with proteins was found to transform fraction I cytochrome *c* into a product which had the same chromatographic characteristics on columns of 'Amberlite *IRC*-50' as the fraction II present in preparations of horse heart cytochrome *c* (compare with ref. 5), and, like it, was spectroscopically identical with fraction I but enzymically inactive. This alcohol-modified cytochrome *c* will therefore be referred to as fraction II. When the reaction of fraction I cytochrome *c* with fluorodinitrobenzene was carried out in water, thus preventing the transformation into fraction II, the distribution of the histidines into the various dinitrophenyl derivatives was the same as that shown by the dinitrophenyl fraction II obtained from reactions with fluorodinitrobenzene in 66 per cent ethanol for short periods.

Fraction II, moreover, appears to be an 'unfolded' or 'denatured' form of the native fraction I, as evidenced by the fact that with fraction II nearly all the twenty-two lysine residues present in the cytochrome *c* molecule react with fluorodinitrobenzene, whereas only fourteen can bind this reagent when fraction I is maintained in its original form during the reaction. A typical series of results is given in Table 1.

These results are in good accord with those obtained by Theorell and Åkesson[1] and Paul[3] with beef heart cytochrome *c*. Since in horse heart cytochrome *c* there are two histidine residues the imidazole groups of which are unavailable for reaction with fluorodinitrobenzene both in the folded native protein (fraction I) and the spectroscopically identical but unfolded enzymically inactive molecule (fraction II)[5], these groups are presumably already occupied, and possibly co-ordinated with the hæm iron.

Paul's recovery of only 0.47 mole as free histidine out of the original 3 moles in beef heart cytochrome *c* treated for two hours with fluorodinitrobenzene in the presence of ethanol[3] probably indicates that the third histidine, which had only partially reacted with fluorodinitrobenzene, corresponds to the one in horse heart cytochrome *c* which has an unreactive imidazole group but a slowly reacting α-amino-group (see Table 1). If this analogy is correct, and we assume further that the second hæmochromogen-forming group in horse heart cytochrome *c* is not one of the other two histidines reacting with fluorodinitrobenzene, in beef heart cytochrome *c* the second hæmochromogen-forming group is therefore probably not a histidine. This conclusion is similar to that arrived at by Paul as a result of his titration experiments[3].

It should be further noted that the one mole of *bis*-dinitrophenylhistidine and the one mole of α-dinitrophenylhistidine were the only end-groups so far observed with the fluorodinitrobenzene technique, thus suggesting that the cytochrome *c* molecule is built up of two peptide chains. In contradistinction to this, Theorell and Åkesson[1] calculated that beef heart cytochrome *c* contains nine to ten free amino-groups; they took the difference between the number of groups taking part in the Van Slyke nitrous acid reaction and the number of lysine residues found by analysis. Unless there is a profound difference in the proteins of beef and horse heart cytochrome *c*, this discrepancy is even larger than the large differences commonly noted with other proteins between the number of amino end-groups actually determined, as by the fluorodinitrobenzene technique, and the number calculated from the difference between the total free amino-nitrogen and that of the lysine residues. In the case of cytochrome *c*, this difference may have been increased by acidic peptides and amino-acids containing no lysine, bound electrostatically to the strongly basic cytochrome *c* protein[1] in the electrophoretically purified preparations of Theorell and Åkesson. These preparations contained 0.43 per cent iron, whereas those used in the present work contained 0.465 per cent iron, corresponding to a difference in equivalent weight of slightly more than 1,000, or some eight amino-acids.

I am grateful to Dr. K. Bailey and Dr. F. Sanger for instruction in the use of the fluorodinitrobenzene technique, and for their constant help in this work.

The Sun's Magnetic Field and Corpuscular Emission

A NEW instrument, the solar magnetograph[1], has been developed for measuring and recording weak photospheric magnetic fields. With it, more than 450 magnetograms showing the distribution, intensity and polarity of weak fields (greater than 0.3 gauss) on the sun have been obtained over a two-year period including the recent minimum of solar activity[2]. Most of the large-scale features of the magnetic pattern show a certain regularity, but there are pronounced random variations. There is also a partially resolved fluctuating fine structure showing changes of the order of 0.5 gauss in 30 min.

General Magnetic Field. Consistent evidence has been found for a dipolar component opposite in polarity to the field of the earth. The mean intensity near the poles is of the order of 1 gauss. This field is usually limited to heliographic latitudes greater than about ± 55°; it has a varying fine structure and shows remarkable random fluctuations in effective intensity and extent. There seems to be no prevailing obliquity between the magnetic and rotational axes. The total flux is estimated to be nearly 10^{22} maxwells.

Bipolar Magnetic Regions. In the lower latitudes the stronger magnetic effects appear rather abruptly as contiguous areas of opposite polarity, as if loops of a submerged toroidal field were occasionally brought to the surface[3]. The bipolar magnetic regions obey Hale's laws of sunspot polarity[4], but spots are comparatively rare, occurring when at all within such regions while they are young and active. Ca II *plages* are observed where the mean field intensity is greater than about 2 gauss. Hydrogen filaments occur around the borders of bipolar magnetic regions, or, alternatively, seem to divide the region into parts of opposite polarity. As the regions age, they generally expand, showing a decrease in field intensity, and disintegrate until lost in the background of irregular weak fields. There is much diversity in total magnetic flux, duration, area, and course of development.

Unipolar Magnetic Regions. Occasional extended areas of only one outstanding polarity were recognized on the magnetograms, but in no other way. The most prominent unipolar magnetic region of 1953 had a mean intensity of about 0.5 gauss and a duration of nine months or more; on each solar rotation its central passage on the disk preceded by about three days the onset of terrestrial magnetic storms in a prominent 27-day sequence. Unipolar magnetic regions may be remnants of disintegrating bipolar magnetic regions from which the lines of force have diffused outward through the corona. We suggest tentatively that unipolar magnetic regions may be identified with the hitherto hypothetical M regions of Bartels[5].

The observations provide objective evidence that magnetic fields are fundamental to sunspots, *plages*, prominences, chromospheric fine structure, bright coronal emissions, regions of strong radio emission and, perhaps, M regions. Several solar phenomena can be synthesized on the hypothesis that neutral streams of ions and electrons are being ejected more or less continually from all turbulent regions of the surface characterized by coherent magnetic fields of mean intensity 0.5 gauss or more. This corpuscular ejection is supposed to be associated with spicule activity, and to result in the acceleration of tenuous streams, individually intermittent, to velocities of some hundreds of kilometres a second in the upper chromosphere and the corona. Above the photosphere the ejected streams are guided by the magnetic lines of force over the bipolar, unipolar, or polar region, as the case may be. The streams above the spicules are composed largely of ionized hydrogen and hence are invisible except in so far as they excite the coronal radiations of the arches, rays and plumes outlining the lines of force. Corpuscular streams ascending both sides of the 'magnetic arches' above a bipolar magnetic region collide near the top, generating radio noise[6], and condense, forming visible prominences. With the emission of radio energy the material cools, the hydrogen becomes partly neutral, and the prominence begins a possibly lengthy but precarious existence under the combined influence of growth, gravity and magnetic forces. Finally, the material largely slides back down the magnetic lines of force or may be thrown outward by expansion of the arches. Above unipolar regions the streams move outward diffusely and more or less radially from the sun[7], without pronounced collisions, and hence are not generators of strong radio noise; if they interfere with the earth, they cause M-region phenomena. From the polar regions, where spicule activity is pronounced, corpuscular streams may recede to considerable distances. Much of the material may arrive in the vicinity of the equatorial plane, where the magnetic field is doubtless highly irregular. Through magnetic coupling, such material may carry away from high heliographic latitudes a share of angular momentum that is large in proportion to its mass.

A tentative model for corpuscular ejection involves local concentrations of the coherent magnetic field by random turbulent processes in the photosphere. Occasional attainment of equipartition of energy results in formation of concentric tubes of magnetic force of intensity ~ 500 gauss. Travelling hydromagnetic waves in the form of constrictions in the tubes of force are supposed to move upward with velocity $H/\sqrt{4\pi\rho}$. Owing to the decrease of density, ρ, by a factor 10^6 in less than 10,000 km., velocities of several hundred kilometres a second may be expected in the high chromosphere if H decreases moderately. Small tenuous clouds of ions and electrons are supposed to be squeezed up the magnetic tubes ahead of the constrictions at the wave velocity. H. Alfvén[8] has considered heating of the corona by hydromagnetic waves; we extend this idea with the concept of constrictive waves in magnetic tubes of force.

Non-Linear Plasma Oscillations and Bursts of Solar Radio Emission

WILD and co-workers[1] have reported observing a fundamental and its second harmonic in the radio spectrum of some solar disturbances. Three characteristic features of the observations are: (i) the frequency bands drift towards the lower frequencies with time, (ii) the received intensities of the fundamental and second harmonic are similar, (iii) the harmonic peak usually occurs at slightly less than twice the frequency of the fundamental peak.

Because of their frequency drift, these bursts of radiation have been associated with the outward travel of streams of particles in the solar atmosphere. Inferred velocities range from several hundred to 10^5 km./sec. Such streams of particles could supply the energy of the most intense radio disturbances.

The observed intensity and frequency ratios have been explained by Wild *et al.* in terms of propagation characteristics of the solar atmosphere. In doing so it was found necessary to assume that the fundamental emission occurs at, or near, the plasma frequency. This points strongly to the origin of the radiation in plasma oscillations. The presence of the second harmonic implies a non-linear oscillator and suggests longitudinal plasma oscillations.

It is the purpose of this communication to show that exact travelling-wave solutions, rich in even harmonics, can be obtained for non-linear plasma oscillations.

The case investigated here is that of longitudinal electron oscillations in a plasma stream. Effects of temperature and magnetic field are neglected.

Let v and n be the electron velocity and density, v_0 and n_0 those of the positive ions in the plasma, E the electric field, ω the angular wave frequency, and ω_0 the angular plasma frequency given by $\omega_0^2 = 4\pi e^2 n_0/m$, $-e$ and m being the electron charge and mass. If the two independent variables, t and x, occur only in the combination $\omega t - kx$, the equations describing the plasma are (in e.s.u.)

equation of motion $$v'(\omega - kv) = -\frac{e}{m}E, \qquad (1)$$

equation of continuity $$n'(\omega - kv) - knv' = 0, \qquad (2)$$

and Poisson's equation $$n - n_0 = \frac{k}{4\pi e}E' \qquad (3)$$

The prime denotes differentiation with respect to $\omega t - kx$.

Similar equations have been solved by Akhiezer and Lubarskii[2], but their solutions do not seem to satisfy Poisson's equation.

Write $$u = v - v_0. \qquad (4)$$

Assuming that the electron d.c. current density equals that of the positive ions, $n_0 e v_0$, an exact set of solutions of equations (1)–(3) are

$$\omega = \omega_0 + kv_0, \qquad (5)$$

$$\omega t - kx = (l+\tfrac{1}{2})\pi + (-1)^l \frac{u_{\max}}{\omega_0/k}\sqrt{1-(u/u_{\max})^2} + (-1)^l \sin^{-1}(u/u_{\max}), \qquad (6)$$

where $l = 0, \pm 2, \pm 4, \ldots$ applies where u' is positive, and $l = \pm 1, \pm 3, \pm 5, \ldots$ where u' is negative. The origin, $\omega t - kx = 0$, has been placed at $l = 0$, $u/u_{\max} = -1$.

The electron density and electric field are given in terms of the electron velocity by:

$$\frac{n}{n_0} = \frac{1}{1 - \dfrac{u}{\omega_0/k}} \qquad (7)$$

and

$$\frac{E}{E_{\max}} = (-1)^{(l+1)} \frac{u_{\max}}{\omega_0/k}\sqrt{1 - (u/u_{\max})^2} \qquad (8)$$

where

$$E_{\max} = \frac{m\omega_0^2}{ek}. \qquad (9)$$

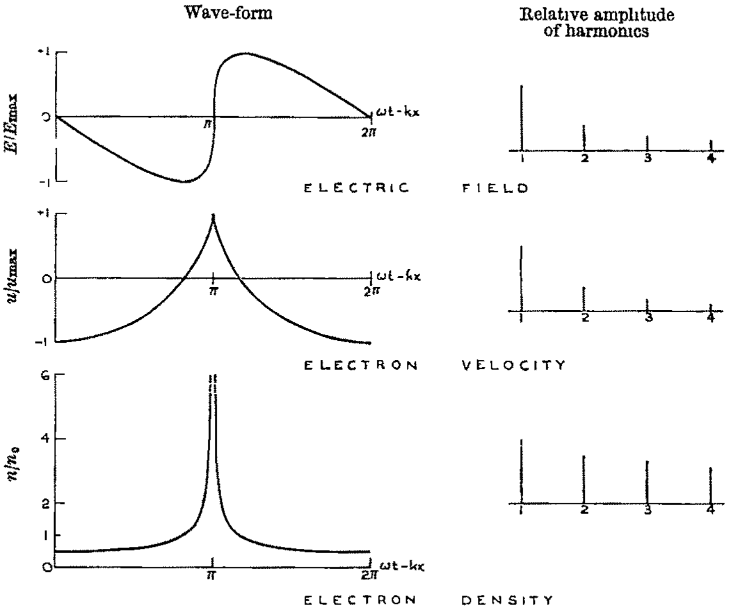

Fig. 1. Longitudinal plasma oscillations. The maximum electron velocity equals the phase velocity

The oscillations reach their greatest amplitude where $u_{\max} = \omega_0/k$, that is, where the maximum electron velocity, $v_{\max}$, equals the phase velocity, ω/k. The wave-form and harmonic content of the oscillations for this case are illustrated in Fig. 1. As can be seen, the oscillations contain even and odd harmonics, with about 70 per cent second harmonic in the case of the electron density. Below maximum amplitude the harmonic content is weaker and approaches the linear case (fundamental only) for small amplitudes.

If large oscillations of this kind are responsible for the emission of solar radio bursts, the present results would suggest that harmonics higher than the second may yet be discovered.

Disintegration Scheme of Copper-62 and its Relation to Recent Mass Measurements

Several nuclear data tables[1,2] report the existence of a 0·56-MeV. γ-ray in the disintegration scheme of the positron-emitting isotope copper-62, the evidence advanced being an unpublished absorption measurement. We have lately had occasion to examine the spectrum of γ-rays emitted by copper-62, and have failed to find any evidence to confirm the existence of such a γ-ray.

A sheet of copper 3 in. × 4 in. × ½ in. was irradiated with X-rays from a 23-MeV. synchrotron. Copper-62 was produced by (γ,*n*) reactions. This source was then placed 2 cm. from the end of a large cylindrical sodium iodide crystal 1⅝ in. in diameter and 2 in. long, which was mounted on a DuMont type 6292 photomultiplier. This crystal was large enough for secondary quanta from Compton collisions and photoelectric absorption processes occurring in its interior to have an appreciable probability of being themselves absorbed. A copper absorber ⅛ in. thick was placed in front of the source to prevent positrons reaching the crystal. The output pulses were amplified and fed into a 100-channel amplitude analyser.

The resulting spectrum showed a single well-defined 'total capture' peak and Compton edge from the annihilation quanta superposed on the usual crystal background. The width of the peak at half-height was 14 per cent, that is, 0·066 MeV. No other peaks were observed in the channels corresponding to 0·6–1·2 MeV. We estimate, having regard to the background, that a peak containing 0·25 per cent of the counts in the total capture peak and of comparable width would have been detected.

The simultaneous absorption by the crystal of a 0·56-MeV. γ-ray and an annihilation quantum would have produced a 'coincidence' peak in the vicinity of 1 MeV. From the above upper limit to the detectable peak, and from the efficiency of crystal detection and solid angle subtended at the source, it follows that not more than 5 per cent of the positrons can be in coincidence with a 0·56-MeV. γ-ray.

Further, the absence of a peak in the observed spectrum in the range 0·6–1·2 MeV. means that there is no evidence for a γ-ray in the range 0·1–1·2 MeV., since γ-rays in the range 0·1–0·7 MeV. would have produced a 'coincidence' peak between 0·6 and 1·2 MeV.; while γ-rays of energy between 0·6 and 1·2 MeV. would have produced the usual total-capture peak in the range 0·6–1·2 MeV. The upper limit of intensity allowed by our observations for a γ-ray in coincidence with the positrons is 5 per cent of the total number of disintegrations. No evidence exists that there is a γ-ray of energy greater than 1·2 MeV., and we conclude that there is no γ-ray in coincidence with the positrons. The total release of energy in the copper-62 disintegration can therefore be obtained from the maximum energy of the positron spectrum[3,4] and is 3·88 ± 0·1 MeV.

The spectrum of copper-62 is important for two reasons. First, the production of this isotope by (γ,*n*) reactions is very commonly used in the monitoring of X-ray beams in the energy range 10–30 MeV. Absolute monitoring is best done by irradiating a thick specimen and detecting the annihilation quanta. The estimation of the activity requires a knowledge of whether or not there are γ-rays emitted.

Secondly, the value of the total energy released calculated above throws doubt on the accuracy claimed for some recent mass measurements. Using the mean of two accurately measured values of the ^{63}Cu(γ,*n*) threshold[5,6], namely, 10·67 MeV., we find that the (^{62}Ni + ^{1}H) − ^{63}Cu mass difference is 6·43 ± 0·12 m.m.u. This is significantly different from the value of 5·7 ± 0·1 m.m.u. obtained from the mass spectrometer measurements by Collins *et al.*[7] of the doublets ^{62}Ni − C$_5$H$_2$ and ^{63}Cu − C$_5$H$_3$. In the same region of the Periodic Table, the ^{64}Zn − ^{64}Ni doublet shows a similar discrepancy, the value obtained from the decay scheme of ^{64}Cu[2] being 1·18 ± 0·03 m.m.u. and that obtained by Collins *et al.* being 2·01 ± 0·08 m.m.u. In view of the second discrepancy, it is not justifiable to attempt to explain the first discrepancy on some basis such as the (γ,*n*) cross-section of copper-63 being negligible in an energy region immediately above the neutron-binding energy. Until these discrepancies are explained, it would appear that the mass measurements in this region should be used with caution.

Thermal Diffusion Potentials and the Sore Effect

In a recent communication[1], Tyrrell and Colledg have directed attention to the possibility of studyin the Soret effect in solutions of electrolytes by observations of the e.m.f. of non-isothermal cells. In suc cells, two reversible electrodes are maintained a different temperatures; owing to thermal diffusion the concentration of solute around one electrod increases and that around the other decreases. I consequence, an additional e.m.f. should graduall be set up, which, for small temperature differences, i simply the e.m.f. of an isothermal concentration ce (with transport) operating at the mean temperatur

During the past two years, we have succeeded i demonstrating and measuring such changes of e.m. in various aqueous solutions, using the followin electrodes, all of which give very reproducibl potentials: platinum/tri-iodide, iodide; cadmiu amalgam/cadmium ion; thallium amalgam/thallou ion. In our experiments, the temperature gradien has been established in sintered glass diaphragm which prevent convection but may possibly giv anomalous results in very dilute solutions owin to surface effects. Most of our observations hav therefore been made at concentrations of 0·1 mol and upwards, it being known[2] that the presence of sintered diaphragm does not affect the isotherm diffusion coefficients of 1–1 electrolytes in this concentration-range.

Experiments using the platinum/tri-iodide, iodid electrode in lithium iodide, potassium iodide an hydrogen iodide were carried out in a modifie diaphragm diffusion cell, fitted with magnetic stirrer and with water jackets, whereby the upper and lowe compartments could be maintained at different temperatures. Clear evidence of the expected effect w obtained; but the method was found unsuitable f quantitative work because it was not possible t maintain sufficiently isothermal conditions within each separate compartment even with vigorous stirring. For this reason a different technique, applicable to amalgam electrodes, was developed. The cell used is shown in Fig 1, the solution is entirely contained in the sintered glass diaphragm, and since its thickness is only about 0·15 cm, Soret equilibrium is established rapidly. Owing to the comparatively poor thermal conductivity of mercury, there are appreciable temperature differences between the thermocouples and the electrode/solution interfaces, of which the temperatures are required. It is therefore necessary to calibrate the temperature-measuring system by comparing the initial e.m.f. of this cell (that is, the e.m.f. when the solution is homogeneous) with the e.m.f. obtained using similar electrodes in a homogeneous solution in a different apparatus in which the temperature gradients in the amalgams are negligible.

Fig 2 shows some results obtained with thallium amalgam electrodes (5·0 per cent thallium by weight) in solutions containing thallous salts. A constant temperature difference of about 6 deg. C. was maintained between the electrodes from zero time onwards, the mean temperature being 25° C, the observed e.m.f.'s are converted to the 'thermo-electric power' (ε) in mV. per deg, with the sign convention that positive ε implies a flow of current from hot to cold in the external (metallic) circuit when the cell is short-circuited. The expected changes of e.m.f. are clearly apparent. Magnetic stirring of the upper amalgam did not produce any detectable change in the e.m.f., showing that the observed effects are not due to thermal diffusion in the amalgam.

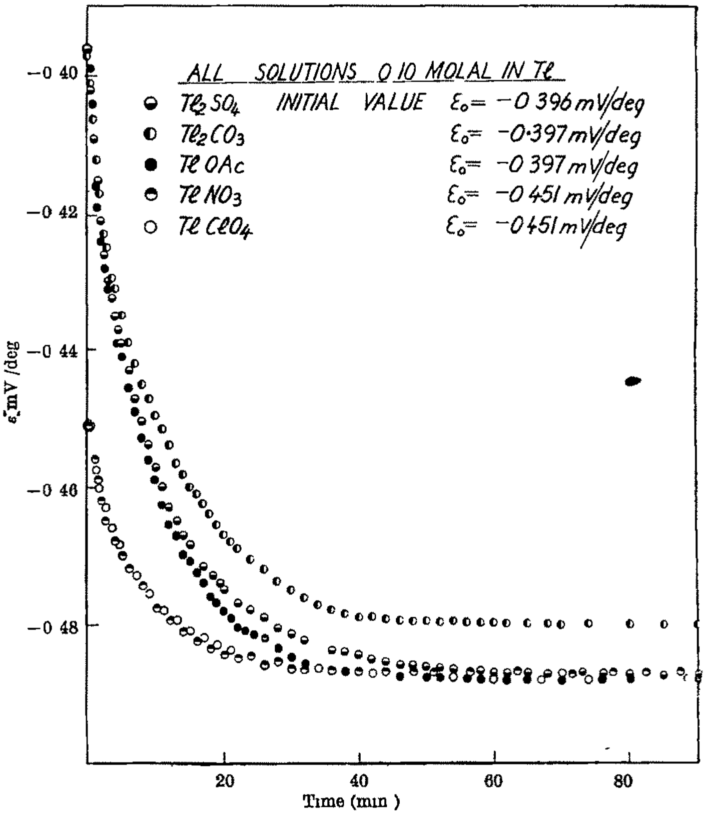

Fig 2

It has been shown theoretically[3] that, provided ionic interaction can be neglected, the final values of the e.m.f.'s of such cells should depend only on the nature and concentration of the ion to which the electrode is reversible, unlike the initial values, which depend also on the properties of the other ions present. It will be seen that this prediction is confirmed by the results, except in the case of thallous carbonate, the agreement of the final e.m.f.'s is surprisingly good in view of the comparatively high concentration used.

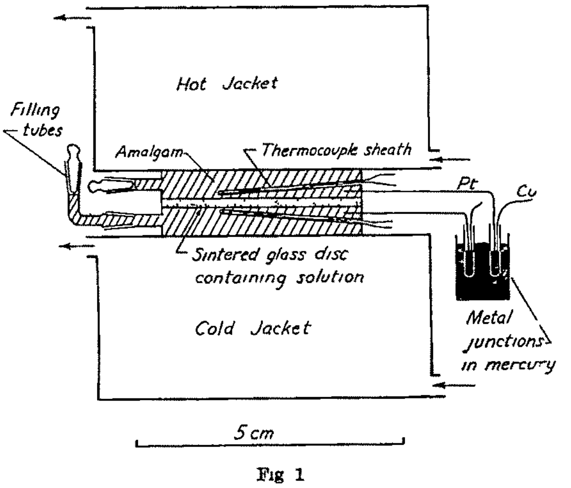

Fig 1

The dependence of e.m.f. on time for these solutions agrees well with the theoretical relationship, although the simplified approximate expression given by de Groot[4] does not adequately represent the observations. A more complicated dependence on time is involved if a mixture of two electrolytes (for example, 0·1 *m* thallous perchlorate + 0·1 *m* perchloric acid) is employed. In this particular case the e.m.f. actually passes through a maximum, the initial value ($\varepsilon_0 = -0{\cdot}662$ mV./deg.) is very low owing to the exceptionally large Soret coefficient of the hydrogen ion, but the final value ($\varepsilon_\infty = -0{\cdot}478$ mV./deg.) is close to that observed in other solutions containing thallium ion at concentration 0·1 *m*.

A fuller account of this work will appear elsewhere.

Fission of Peptide Bonds by Lithium Borohydride

The value of lithium aluminium hydride as a reagent for the characterization of the C-terminal residues of proteins has been investigated by several workers[1], but, except in the case of insulin[2], the potentialities of lithium borohydride have been less fully explored. Grassmann, Hormann and Endres[3] have described a method for the characterization of the C-terminal residues of small peptides which involved esterification followed by reduction with lithium borohydride hydrolysis and identification of the amino-alcohols produced. When a similar technique was applied to procollagen[4], amino-alcohols were obtained even from the un-esterified protein and it was concluded that carboxylic ester groupings were present. Experiments carried out in this laboratory and described below show, however, that cleavage of peptide bonds can be brought about by lithium borohydride, those bonds involving the carboxyl group of glycine or of alanine being particularly susceptible. At present, therefore, little confidence can be placed in lithium borohydride as an end-group reagent for large peptides or proteins

The reduction of small molecules, such as di- and tri-peptides, proceeds satisfactorily at 0° C or at room temperature in tetrahydrofuran solution , but esters of large peptides and proteins are not soluble in the solvent, and more vigorous conditions, that is, heating and stirring, are necessary to achieve complete reduction of the ester group , simultaneous peptide bond cleavage then occurs. Benzoylglycylalanine methyl ester was treated at 0° for 18 hr. and at the boiling point for 4 hr with five molecular proportions of lithium borohydride in tetrahydrofuran solution. After removal of excess reagent and inorganic salts the products were hydrolysed and submitted to paper chromatography. The products from the cold reduction were glycine and alaninol, as was expected, but those from the hot reduction contained in addition a significant quantity of ethanolamine as judged by the intensity of the spots

The action of lithium borohydride on lysozyme and on the mixture of peptides obtained from the fission of silk fibroin at serine residues[5] was examined quantitatively. At the outset of this investigation no method was available for the quantitative isolation and identification of amino-alcohols present in mixtures containing amino-acids and inorganic salts. This was achieved by conversion of the amino-alcohols obtained on hydrolysis of the reduction products to their 2 4-dinitrophenyl-derivatives followed by partition chromatography Details of this method will be published later. Two different procedures utilizing 2 4-dinitrophenyl-derivatives have been published recently[3,6,7]. The formyl seryl peptides from silk fibroin[5] were esterified with diazomethane and attempts were made to reduce the terminal ester groups using a solution of lithium borohydride in tetrahydrofuran at room temperature. The reaction was carried out in a thick-walled cylindrical flask containing a number of glass beads which was rotated in a horizontal position to bring about crushing of the insoluble solid. Apart from a very small amount of serinol, the only amino-alcohols isolated were alaninol and ethanolamine , but the combined yield of these was less than that expected from consideration of previous analytical data[5] even with a reaction period of three days and a large excess of reagent. When the reaction was carried out at 70–75°, much more rapid reduction occurred, the theoretical yield of amino-alcohols being obtained in about 12 hr A reaction period of 18 hr , however, gave considerably more than the theoretical quantity of amino-alcohols. The same amino-alcohols, alaninol and ethanolamine, were also obtained when the peptides were treated under these conditions with the reagent without previous esterification. The combined yield was equivalent to nearly half the C-terminal carboxyl groups present. Although the free carboxyl group of hippuric acid was reduced to a small extent under these vigorous conditions, reduction of the free carboxyl groups could not account for the large quantity of amino-alcohols obtained from the un-esterified peptides It was clearly impossible to distinguish between true end-groups and those formed by fission of the peptide chain. When lysozyme was treated in a similar way with lithium borohydride, the yields of ethanolamine and alaninol obtained were together equivalent to more than 3 C-terminal residues per molecule of weight 14,700. Appreciable quantities of serinol, valinol, phenylalaninol and leucinol (or *iso*leucinol) were also produced.

Hydrogenolysis of the C–N linkage of amides by metallo-hydrides has been observed by several workers[8] , when structural features are favourable, splitting takes place at room temperature and aldehydes are generally obtained. The formation of carbinols is also known. Apart from the greater lability of the glycine and alanine residues it appears that the polypeptide chain is attacked in a more or less random fashion by the reagent: the FDNB technique of Sanger revealed that a number of different N-terminal residues were liberated when lysozyme was treated with lithium borohydride

Protein Synthesis in the Cell Nucleus

THERE is considerable evidence that the cytoplasm of the cell contains structures capable of carrying out protein synthesis[1], and it has been shown in one case[2] that formation of protein may be little affected by removal of the nucleus. These findings seem to exclude the appealing hypothesis that the nucleus is the source of the cell's proteins. It does not follow, however, that the nucleus is incapable of protein synthesis , and in fact there has been some evidence[3] that proteins may be formed in the nucleus. The results described below seem to demonstrate unequivocally the existence of protein synthetic mechanisms that are associated with the nucleus

The experimental material was *Amoeba proteus* The conditions were basal , that is, the cells were maintained in inorganic medium without food organisms for 24 hr before the first observations and during the entire experiment. Amoebae were cut into nucleated and enucleated halves. Intact cells served as controls Immediately after cutting, whole cells and nucleated and enucleated halves were placed in inorganic medium to which methionine-^{35}S

Table 1 AVERAGED VALUES OF UPTAKE AND INCORPORATION OF METHIONINE-^{35}S AT VARIOUS TIMES AFTER CUTTING CELLS (*W* = intact cells, *N* = nucleated halves, *E* = enucleated halves)

		Hours after cutting when incubated in methionine-^{35}S 0–3	24–27	48–51	72–75

	E	30	36	35	30
	W/N	1 0	1 1	1 0	0 96
	N/E	2 5	2 0	2 1	2 5

had been added, and remained there for 3 hr After external methionine had been washed away, the total amount of activity that had been taken up by each group was determined with a windowless Geiger counter Samples of fifty to seventy-five cells were sufficient In a similar manner, the methionine uptake was determined in cells transferred to the methionine solution at 24, 48 and 72 hr after cutting and left for 3 hr After the measurement of total uptake of methionine-^{35}S, the samples were extracted with 5 per cent trichloracetic acid, and the remaining activity determined This is assumed to represent methionine-^{35}S that had been incorporated into protein The term 'percentage incorporation' refers to the fraction of the methionine-^{35}S which had entered the cell and is incorporated into the material insoluble in trichloracetic acid Since it is unlikely that net accumulation of protein could occur under these basal conditions, we are in effect measuring the re-utilization of existing proteins to make new proteins

The averaged results of the experiments are given in Table 1 The point of greatest interest to the present discussion is that percentage incorporation in the enucleated half drops to a level lower than that in the nucleated half by a factor of 2 5 immediately after the cell is cut in half We observe further that while enucleation leads to a progressive decline in the uptake of methionine by the cells, it has no appreciable effect on percentage incorporation for a period of three days By considering only percentage incorporation, we can evaluate the terminal synthetic steps which put the methionine into protein without being confused by effects of the experimental treatments on the uptake or preliminary metabolism of the amino-acid The latter are interesting in themselves and will be discussed elsewhere

The immediate decline in percentage incorporation upon enucleation may be interpreted to mean that part of the protein synthetic mechanisms of the cells is localized in the nucleus Alternatively, it could mean that this fraction of protein synthesis is intimately coupled with some mechanism that is localized in the nucleus Protein synthesis associated with the nucleus under the basal conditions of the experiment is about 40 per cent of the total

The results confirm at the same time the conclusion hat the cytoplasm is capable of protein synthesis The fact that percentage incorporation in the enucleated half does not change appreciably for three lays suggests further that the cytoplasmic mechnisms operate independently of the nucleus, except ossibly on an indirect, long-term basis It will not be expected that the relative levels of the synthesis of protein associated with the nucleus and the independent synthesis associated with cytoplasm will be quantitatively the same under other conditions We would predict that the contribution of the cytoplasm will be relatively greater when the cell is growing and increasing its absolute protein content

Can we assign to the protein synthesis associated with the nucleus a role that will be relevant to the administrative function of the nucleus in the cell ? Let us assume that the routine synthesis of proteins —enzyme formation, etc —is carried out by the cytoplasm The nucleus might be synthesizing those proteins that remain within its boundaries and function there A second possibility follows from currently discussed views on the relation between the genetic system and protein synthesis There is evidence that ribonucleic acid transmits genetic information from nucleus to cytoplasm and there governs the formation of proteins[4] So far as is known, the ribonucleic acid of the basophilic material involved in protein synthesis is not free, but exists as ribonucleoprotein complexes[5] If the genetic system is not producing ribonucleic acid, but ribonucleoprotein, then protein formation associated with the nucleus may represent the synthesis of the protein part of the machinery whereby the cytoplasm makes its structural, catalytic and storage proteins

A fuller account of this work will appear in another publication The investigation was supported by a grant from the American Cancer Society (recommended by the Committee on Growth, National Research Council) and by University of California cancer funds We thank Prof Harold Tarver for methionine-^{35}S prepared in his laboratory

A New Reagent for the Histochemical and Chemical Detection of Calcium

THE dyestuff 'kernechtrot' or nuclear fast red obtainable from G T Gurr, Ltd (batch 3569), or T Gerrard, Ltd (nuclear fast red standard), has been found to be a sensitive reagent for the detection of calcium In all instances the histochemical localizations of calcium indicated by the dyestuff have been confirmed by micro-incineration and microchemical tests Mr G T Gurr informs me that the manufacturers say that the nuclear fast red described here is an anthraquinone dyestuff, and the reactions with calcium salts parallel the reactions of other anthraquinone derivatives observed during a detailed study of histochemical methods for calcium which will be published elsewhere

The nomenclature of the dyestuffs, and related substances, to which the term 'kernechtrot' has been applied, is complicated and deceptive. The substance mentioned here should not be confused with others to which the name has been applied, that involve

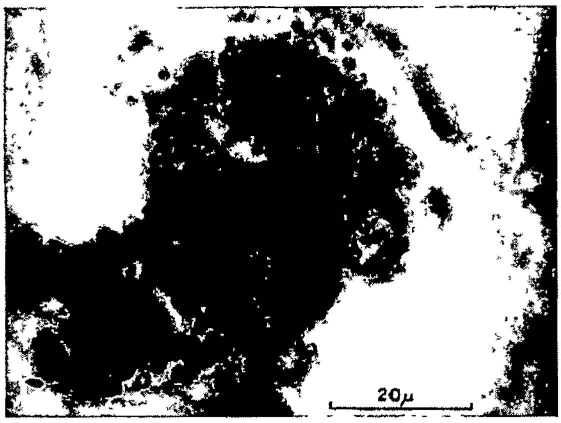

Fig. 1. Calcium cells of *Helix* digestive gland stained with calcium red reagent, showing intense coloration of individual spherules

mixtures of dyestuff with a mordanting metal salt such as aluminium sulphate, or with the diazonium salts of somewhat similar names, for example, 'kernechtrot-salz B'[1]. I propose the name 'calcium red' for the standard dyestuff referred to here, which is itself, in the commercial samples tested by paper-partition chromatography, a mixture of components.

To use calcium red as a reagent for calcium it must be purified to some extent, which may be done by taking 2 gm. of the commercial dyestuff and washing it with 100 c.c. of distilled water twice. The residue is then made up into a saturated aqueous solution (about 0.25 gm. in 100 c.c.), and this solution will react rapidly with deposits of inorganic calcium salts, producing a lake in the form of a brilliant red precipitate. The reaction depends upon the liberation of free calcium ions, and hence is affected by the solubility of the calcium salt present. The reaction does not therefore take place with the intensely insoluble oxalate, found, for example, in the left colleterial gland of the cockroach[2].

Since the method depends upon the formation of a precipitate close to the site of the original substance, it is subject to the normal type of cytological diffusion error[3]. Nevertheless, localization is usually good. A full description of the procedure will be published elsewhere. The technique has worked with complete success upon the calcium deposits found in the following tissues: digestive gland of the snail (*Helix*), digestive gland of *Anodonta*, the hepatic cæca of *Carcinides*, the malpighian tubules of the cockroach, and the glands of Swammerdam of the frog. A clear distinction must be made between the formation of the dye-lake precipitate, and staining effects which may occur between the dye, the dye-lake, and the tissue proteins and other constituents, of the mordant-staining type, which cause a general pink staining of the background. This problem will be considered elsewhere.

The reagent may be used as a supra-vital reagent; also, as the laking response is not prevented by the presence of potassium hydroxide, provided the *p*H is not too high, it is likely that calcium red will be applicable in techniques for the gross staining of skeletal structures, in a manner comparable to alizarin red S[4-6].

The reagent enables one to make an immediate distinction between tap water and distilled water. The dyestuff appears to show selectivity between the alkaline-earth metals, and aluminium and magnesium. The selectivity should be of importance in qualitative analysis, and it is hoped that this communication will bring the dyestuff to the attention of inorganic chemists.

I wish to thank Dr. J. R. Baker, Dr. W. G. B. Casselman and Dr. P. C. J. Brunet for their critical advice and encouragement. Mr. Edward Gurr and Mr. George Gurr have kindly provided me with information about the various 'kernechtrot' substances. I am grateful to Prof. A. C. Hardy for the excellent facilities of his Department. The work was carried out during the tenure of a Christopher Welch Scholarship, and a grant from the Department of Scientific and Industrial Research.

An Intracellular Lipoidal Cycle and its Disruption by Neutral Red

A CYTOLOGICAL study has been carried out on fixed, living and frozen-dried acinous cells of the pancreas of the mouse. Observations on fixed preparations prepared by Baker's[1] sudan black technique have shown that zymogen granules are formed from certain lipoidal prozymogen bodies which originate from mitochondria in the form of small granules. The granular prozymogen bodies migrate towards the Golgi apparatus and finally establish contact with it. It seems quite possible that the Golgi apparatus makes some contribution to the lipoidal bodies to be included in, or to facilitate, the production of zymogen. The prozymogen bodies next leave the Golgi apparatus and become vacuolated so that each one comes to consist of an outer lipoidal sheath which envelops an inner immature zymogen granule. In the zymogen zone the lipoidal sheath is lost and a mature zymogen granule makes its appearance, usually with a small particle of lipid adhering to its surface.

Zymogen secretion is brought about in a manner similar to zymogen synthesis. Among the zymogen granules a few small vacuolated bodies (1 μ in diameter) appear and increase in size at the expense of the surrounding granules. These bodies correspond with the secretion spaces[2] recorded by several workers and therefore are termed 'secretion bodies'. Each secretion body consists of an outer lipoidal coat and an inner substance which is formed by the absorption of the zymogen granules. The secretion bodies are usually extruded intact into intercellular secretion canaliculi along which they pass into the main duct system.

The sudan black method revealed no difference morphologically, apart from a slight difference in size, between vacuolated prozymogen bodies and small secretion bodies. Indeed, in some cells there was little doubt that some secretion bodies were formed by the coalescence of many small prozymogen bodies It appears, therefore, that zymogen synthesis and zymogen absorption are brought about by the activity of the same intracellular lipoidal cycle

The intracellular lipoidal cycle is synchronized with, and part of, an intracellular secretion cycle This secretion cycle consists of three main phases (1) recovery phase, during which zymogen synthesis is maximal and there are many lipoidal prozymogen bodies, (2) resting phase, during which zymogen synthesis is minimal and there are few lipoidal prozymogen bodies, and (3) discharge phase, during which zymogen granules are absorbed by lipoidal secretion bodies

When mice were each injected with 1 c c of a saturated solution of neutral red, the acinous cells eventually became filled with masses of neutral red granules These originated from mitochondria in the same way as prozymogen bodies, and in fixed preparations coloured with sudan black Morphologically they were identical with prozymogen bodies, but there was no evidence to suggest that they ever formed zymogen granules Rather, the evidence supports the view that the cells had produced large numbers of lipoidal bodies which segregated the neutral red Since there had been this great synthesis of lipid in the majority of cells irrespective of their physiological condition, it was clear that neutral red had disrupted the normal gearing of the intracellular lipoidal cycle with the secretion cycle

Lipid Nomenclature

The following views, although divergent in some particulars from those of Fisher[1], may be useful for onsideration when the terminology of fatty subtances is revised by an international commission, and in lipid chemistry generally

It is desirable at the outset to define 'lipids' as he naturally occurring substances comprising fatty acids and their derivatives or compounds, and to ubdivide them into homolipids, heterolipids and ipid complexes according to whether they contain nly carbon, hydrogen and oxygen or these and other lements in addition, and according to whether they re true compounds or contain molecules associated y secondary valence

In the accompanying scheme, based upon the recommendations of the International Union of Chemistry's Commission on the Nomenclature of Biological Chemistry[3], the proposed nomenclature for pids is taken from the existing literature, supplemented in the case of the heterolipids with such modifications as are dictated by the necessity for ransition from empirical to systematic chemical omenclature when that is made possible by research

(The spellings 'lipid' and 'lipide' are both in common se, 'lipid' is adopted here by analogy with other ciences[2] and because of the specific chemical significance of the suffix '-ide'[2] The pronunciation ĭpĭd' is suggested by derivation from λιπος The erm 'lipoid', which was probably the most correct tymologically, has now fallen into disuse, '-ide' in glyceride, phosphatide, etc, is justified by common use)

Proposed Classification of Lipids

1 Homolipids
  - *a* Glycerides
  - *b* Ester waxes
    - (i) Cerides (higher acyl esters of long-chain primary alcohols)
    - (ii) Sterides (higher acyl esters of sterols)
  - *c* Glyceryl ether esters (higher acyl esters of glyceryl long-chain alkyl ethers, for example, selachyl alcohol)
  - *d* Etholides (alternatively estolides lactide-like condensation products of hydroxy acids)
  - *e* Lipoglycosides (higher acyl compounds of carbohydrates, etc)

2 Heterolipids
  - *A* Phospholipids
    - *a* Phosphatides (heterolipids containing phosphorus and possibly, but not necessarily, amino-nitrogen, the latter can be indicated by prefix in reference to individual compounds)
      - (i) Phosphoglycerides (phosphatidyl ethanolamine, phosphatidyl choline, phosphatidyl serine, etc)
      - (ii) Phosphoinositides
      - (iii) Phosphoglyceroinositides
      - (iv) Phosphoglyceracetals (acetal-phospholipids, formerly plasmalogens or acetal phosphatides)
      - (v) Polyphosphoglycerides (for example, cardiolipin)
    - *b* Phospholipamides (heterolipids containing phosphorus and amido-nitrogen)
      - (i) Lipamidolphosphorylamines (containing fatty amide, long-chain alcohol, phosphoric acid and base, for example, sphingomyelin)
      - (ii) Lipamidolphosphates (fatty amide, alcohol and phosphoric acid, for example, ceramide phosphates)
  - *B* Lipamides (heterolipids containing amido-nitrogen but no phosphorus)
    - *a* Ceramides
    - *b* Lipamidolglycosides (containing fatty amide, alcohol, carbohydrate and base, for example, cerebrosides)
  - *C* Sulpholipids

3 Lipid Complexes (association by accessory valence)
  - *A* Phospholipid-carbohydrate complexes
  - *B* Lipoproteins

The appellation 'ternary' is not true of cerides, etc, so listed in the International Union's classification, and the term 'complex' is more properly applied to association compounds[4]

'Phosphatide', as originally defined by Thudichum[5] to mean fatty substances containing phosphorus and possibly but not necessarily nitrogen, has been retained, but, as exemplified in the table, reference has been restricted to amino groups The term is still the one most widely used for the substances thus listed[6,7], and Channon and Chibnall[8] explicitly derived from it the name 'phosphatidic acid', a less cumbersome alternative for di-acyl glycerophosphoric acid

Afterwards, Folch[9] used phosphatidic acid as the basis for referring to the compounds formerly called lecithin and kephalin, as phosphatidyl choline and phosphatidyl ethanolamine, respectively The analogous α-amino-hydroxypropionic acid derivative is designated 'phosphatidyl serine'

Folch-Pi and Sperry[7] agreed to the retention of 'lecithin' for alcohol-soluble phospholipid fractions and 'kephalin' for the alcohol-insoluble, lecithin, thus defined, usually contains both phosphatidyl choline and ethanolamine

The isolation by Folch[10] of phosphatides of which the characteristic polyhydroxy residue is inositol led that worker and Sperry[7] to propose the term 'phosphoglyceride' for the type of substance dealt with in the two preceding paragraphs The extension of this nomenclature to 'phosphoglyceroinositides' for phosphatides containing both polyhydric residues[11] follows naturally It should be noted that the term 'glycerophosphatide', proposed by Celmer and Carter[6], is redundant and phosphoglyceride is therefore preferable to it

Although the acetal-phospholipids, formerly called plasmalogens or acetal-phosphatides[12], fall within the group defined as phosphatides, it is necessary to denote in their terminology the difference between the diacyl character of the phosphatidyl compounds and the acetal of the 'plasmalogens' The general term 'phosphoglyceracetals' is therefore proposed for them, and individual compounds[13] can be distinguished by placing the name of the nitrogenous moiety before the class name

The suggested introduction of 'phosphoglyceratid'[1] could lead to ambiguity as to whether the compound was of the glyceride or acetal type, moreover, it does not seem to offer any advantage over extant usage 'Phosphoglycolatid' is excluded as referring to a synthetic product

Regarding those heterolipids which are characterized primarily by the presence of nitrogen, it is fairly generally the case that at least one of the nitrogen atoms is present in amido linkage[14] 'Lipamide' and 'phospholipamide' therefore seem to be obviously suitable as general terms for those compounds, and they make possible a subclassification of some of the compounds listed under 'sphingolipids' by Celmer and Carter[6]

Cerebrosides (to use the current term) would remain a subgroup of lipamides In the selection of names for these subgroups, it should be borne in mind that it has recently been shown[15] that they may give rise on hydrolysis to amines other than sphingosine The inclusion of names of specific compounds such as sphingosine as roots of general terms is therefore to be avoided

Individual lipamides and phospholipamides can be specifically named, according to the proposed system, by substitution of the stem-names of the fatty acid, long-chain alcohol and base for the roots 'lip-', '-ol-' and 'amine', respectively, in the general term Sphingomyelin (although now sufficiently well known by that name to remain as such) would be lignoceramidosphingosine–choline–phosphoric acid diester Expansion of this for detail and transformation to the Geneva form, showing the compound as a substituted octadecene, present no difficulty.

The gangliosides, etc, remain for analogous treatment when their constitutions become fully known.

Flowing Chromatography on a Circular Paper Pack

The possibility of combining the advantages of circular paper chromatography with those obtained by using an automatic fraction collector for separation and isolation of substances from a mixture has been investigated The essential features of the technique consist in the application of the method of preparative circular paper chromatography[1] for the separation of the substances on a paper pack, followed by the elution of the components by means of a device for facilitating the flow of the solvent from the edge of the paper pack Fig 1 is a diagrammatic sketch of the apparatus devised

The solution to be analysed is spotted at the centre of each Whatman No 3 (31 5 cm diam) paper and the paper pack containing four or five papers is developed according to the procedure described before[1] The paper pack is then subjected to elution In this step, when the solvent front reaches the edge of the paper, the rate of flow will be prevented unless a special device is adopted to continue the flow By serrating the edge of the paper pack as shown in Fig 1, the slowing up of the solvent speed is prevented, thereby facilitating the regular flow through the pointed ends of each of the serrated edges touching the inner surface of the funnel (*E*)

The apparatus consists of two circular glass disks (*A* and *B*) (7–8 mm thickness, 28 cm diameter) At the centre of one (*A*) of the disks is cut a round hole of 3 2 cm diam The paper pack (*C*) after preliminary development has a hole cut at the centre with a diameter of 3 2 cm and is placed between the glass disks, clamped by means of screw clamps (*D*).

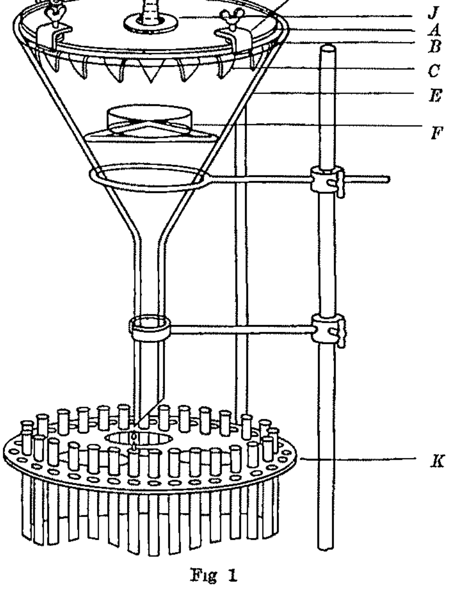

Fig 1

The paper pack with the glass disks is placed over a large funnel (*E*) (31.0 cm. diameter at the top), the pointed edges of the papers touching the inner surface of the funnel. A Petri dish (*F*) containing the solvent is placed over a glass triangular support inside the large funnel to saturate the atmosphere with the vapours of the solvent. The paper pack is then eluted with the solvent. The elution step is facilitated by the experimental arrangement shown in Fig. 1. It consists of a separating funnel (*G*) (100 c.c.) with a ground-glass joint, and another flask (*H*) (500 c.c.) which is first filled with elutant. The end of the separating funnel with the stopcock (*I*) closed is then inserted into the neck of the flask and inverted over the central hole, the neck of the funnel touching the surface of a small paper disk placed at the centre of the bottom disk. By opening the stopcock (*I*) the central well is filled with the solvent. By carefully manipulating the stopcock, the paper pack can be irrigated at a slow rate until the solvent front reaches the pointed edges of the paper. Later, the funnel (*G*) is completely filled with the solvent, and is carefully raised until the surface of the neck of the funnel is just above the surface of the bottom disk, so as to maintain a pool of solvent at the centre. A plastic ring (*J*) is placed over the solvent pool to minimize evaporation of the solvent. The stopcock is kept open until the solvent is completely drawn out. By this automatic device, continuous flow of the solvent can be maintained. The effluent coming out of the funnel (*E*) can be collected in a large number of fractions by means of an automatic fraction collector (*K*) and the fractions can be analysed according to the usual methods.

The method was applied to the separation of components from an artificial mixture of sugars and dyes. Mixtures of rhamnose (160 mgm.) and maltose (160 mgm.) (using *n*-butanol – ethanol – water), and rhamnose (200 mgm.), glucose (200 mgm.) and maltose (200 mgm.) (using butanol – acetic acid – water) were separated into fractions containing chromatographically pure components; the separation, however, was not quantitative, as some fractions contained mixtures of two sugars. A mixture containing methyl orange, neutral red and methylene blue was separated into individual components using 80 per cent ethanol as solvent.

Relative Contribution of Disparity and Convergence to Stereoscopic Vision

WRIGHT'S[1] apparatus for measuring stereoscopic acuity has been modified to enable the measurements to be extended to wider separation between the tested targets. When operated in the dark, it provided two illuminated circular apertures seen against a black background. The experiments were carried out under two conditions of observation. Under condition *A*, the observer looked binocularly at one of the targets (*P*) and then to the second (*Q*). Under condition *B* the observer looked at *P* only but saw *Q* extrafoveally. In each case he was asked to estimate their relative apparent distances, and judge whether *Q* was nearer or farther than *P*.

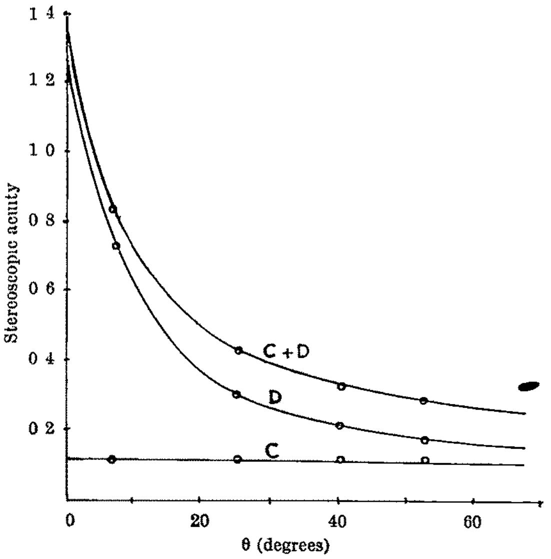

Fig. 1. Stereoscopic acuity decreases as the angle of separation (θ) between the two targets increases. *C* denotes convergence and *D* disparity

When the percentage estimates (for nearer, say) were plotted against the distance of the target *Q*, a typical psycho-physical ogive curve was obtained for each observer. From this the standard deviation was deduced as a measure for the threshold of stereoscopic vision.

Like other workers, and lately Wright, I find that acuity under condition *A* is greater than that under condition *B*, and in either case it decreases as the angle between the two targets increases. But there are conflicting views as to the explanation of the fact that stereoscopic acuity under condition *A* is higher than the corresponding value under condition *B*. The probable reason is that, under condition *A*, the convergence factor was operating, whereas under condition *B* it was absent. Since both convergence factor (*C*) and the disparity factor (*D*) co-operate in stereo-acuity, their percentage effects are considered to be simply additive.

From the experimental results, the ratio $(C+D)/D$ of the two effects can be found and so the effect of *C* alone can be isolated. Fig. 1 shows the change of either *C* or *D* with the change of the angle of separation. It shows that the role of convergence is relatively small (about 10 per cent of the stereo-acuity in the case of foveal vision), that disparity is the main factor responsible for stereoscopic vision, and that disparity does not fall below the corresponding value for convergence before an angle of separation of about 66°.

Convergence is found also to be of nearly constant value whatever may be the angle of separation. This proves that the process of convergence is nothing but a mechanical one, since the design of the eyeball enables it to rotate with great facility. Convergence is then a means of setting the eyes in the proper position for disparity to begin to act. The relatively small part played by convergence in stereoscopic vision agrees with the views of Wheatstone, Helmholtz, Valentine[2] and others.

Wright considered convergence to have a relatively important role in stereoscopic acuity, especially in the extrafovea. On the contrary, I believe his results lead to a negative value for convergence at zero angle of separation; this result cannot be understood at present.

Ogle's[3] view supports my opinion on the unimportance of the convergence factor. He assumes a fixation pause to occur between the two targets during the observation under condition *A*, and thus there will be optimal stereo-acuity when the point of convergence is half-way between these two targets. When I plot the results for condition *A* upon the same graph as condition *B* but at only half the angular separation, the two sets of observations are not greatly different. But this does not prove the adequacy of Ogle's assumption, since the fixation pause did not occur in the present experiments.

An explanation may be provided by Ogle's second assumption that the brain utilizes the information obtained during the rapid sweep of the eyes as they transfer fixation from one target to the other. The problem is still in need of further work.

Functional Structure of the Retinal Fovea and Maxwell's Spot

A reddish spot can be seen in the centre of the visual field when a white surface is viewed by a normal observer through a dichroic filter transmitting red and blue lights. This phenomenon is called Maxwell's spot and interpreted usually as an entoptic phenomenon due to preferential absorption of blue light in macular pigment. Among various types, the commonest is of symmetrical circular form and is made up of three concentric zones: a spot, a clear ring and a halo, going from the centre to the outside[1,2]. The central spot and the halo are reddish, and the clear ring has the same chromatic quality as the background field, which is bluish-red in most cases.

Walls[2] has reported that protanopes and protanomals saw Maxwell's spot, whereas the majority of his deuteranopes and deuteranomals did not, and this has been confirmed by our experiment. The fact that, although deuteranopes have macular pigmentation, none of them can see Maxwell's spot makes the usual explanation of this phenomenon untenable. The central floor of the fovea contains little or no macular pigment[3], so that selective absorption of blue light is inconceivable, at least in the foveal centre. Nevertheless, the central part of Maxwell's spot looks reddish in the common type of normals. In view of these facts, Walls has presented a new hypothesis of non-uniform distribution of the receptor types in the fovea. This interpretation seems to receive support from the experiment by Motokawa *et al.*[4], indicating that the excitation of the blue receptor was decidedly small at the foveal centre compared with that of the red receptor.

In order to provide more conclusive evidence for the theory, we had our subjects plot Maxwell's spot with a dichroic filter, Wratten No. 2389, and explored the spatial distribution of retinal processes by means of Motokawa's method in the same subjects under comparable experimental conditions. This method has been described in detail in a previous paper[5], so that only its principle will be mentioned here. Following a brief illumination, the electrical sensitivity of the dark-adapted eye is measured, with electrical phosphenes as an index. The sensitivity increases above normal after a brief depression, reaches a maximum in a few seconds and decreases gradually to the resting level. Percentage increases in electrical sensitivity are denoted by ζ. ζ-values at 1, 2 and 3 sec. after termination of a photic stimulus represent the magnitudes of the red (*R*), the green (*G*) and the blue (*B*) processes, for the reasons stated in the previous paper[5]. As only red and blue lights were transmitted by the filter used, the processes *R* and *B* were measured at each retinal position. As is shown in Fig. 1, Maxwell's spot of a normal subject K. M. consisted of a spot, a narrow clear ring and a halo (type II of Walls's classification). Corresponding to the deep red spot at the foveal centre, *B* was definitely small compared with *R*, while both processes were of equal magnitude at the bluish-red clear ring. In the area corresponding to the halo, *B* was found to be greater than at the foveal centre, but still smaller than *R*. This distribution accounts satisfactorily for the quality of sensations at each part of Maxwell's spot. The regional variation of the *R* process cannot be explained in terms of the macular pigment, because red light eliciting *R* is not absorbed by the pigment.

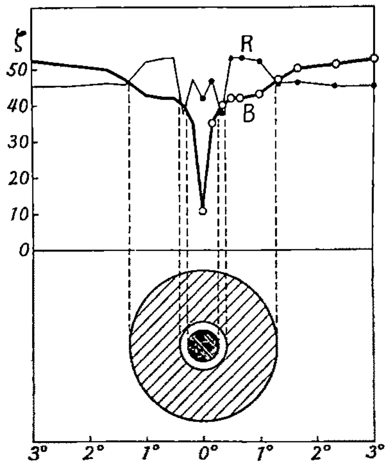

Fig. 1

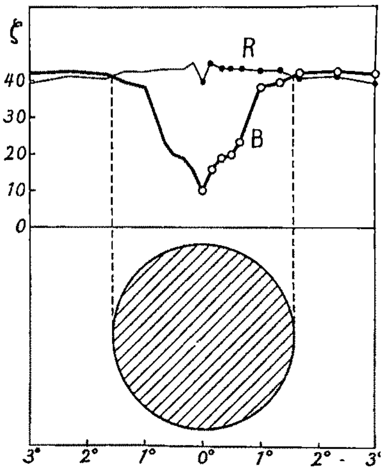

Fig. 2

Fig. 1. Spatial distribution of red (*R*) and blue (*B*) processes in fovea (above), and Maxwell's spot (below). Exploring spot of light was 2′ in visual angle during measurement of retinal processes. The more reddish-looking areas of Maxwell's spot are shaded with oblique lines

Fig. 2. Another case of normal Maxwell's spot and corresponding distribution of retinal processes

In Fig 2 another normal type is illustrated (type IV) The structure of Maxwell's spot is much simpler in this case, in good agreement with the less complicated pattern of the distribution of *R* and *B* In the foveæ of deuteranopes, *R* and *B* did not display any regional variation, as expected from the absence of Maxwell's spot

Grouped Variations in the Occurrence of New Protein Components in Normal Human Serum

A METHOD of zone electrophoresis using starch gel as the supporting medium has been developed The advantages of zone electrophoresis and the convenience of protein detection by staining methods are combined with a resolving power in some cases superior to that obtained in free-solution boundary-electrophoresis The method has been tested with human serum proteins, with cabbage enzyme preparations[1], and with crystalline β-lactoglobulin which has been successfully resolved into its two main components[2].

The present communication reports on variations in the number and distribution of the serum proteins from normal human individuals as demonstrated by this starch gel electrophoresis A more detailed discussion of the present results and of the method, giving full experimental details, will be published elsewhere

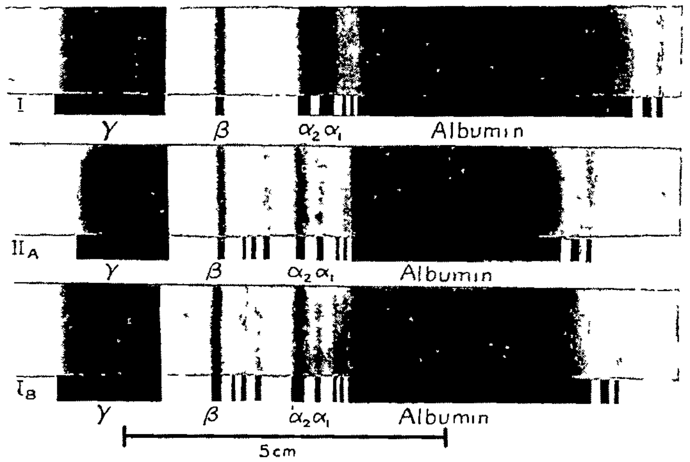

Fig 1 Photographs and explanatory diagrams of the stained gels obtained with typical sera from (top to bottom) group I, group II$_A$ and group II$_B$ Those components which show considerable variability even within a given group are not indicated in the diagrams The differences in extent of migration of the front of the albumin in the three experiments should be disregarded, they will be considered in a later publication

Sera free from visible hæmolysis products were prepared from forty-three normal individuals (twenty males, twenty-three females) In the preparation and electrophoresis of these sera the experimental procedures were carefully maintained constant

A number of previously undescribed components was observed in all the serum samples, with a variation in the number of these observable in the serum from different individuals However, all sera were found to fall into one of two main groups Sera in the first group (I) gave a pattern of protein distribution of the type shown in the upper part of Fig 1—the proteins being stained with amido-black 10*B*. This pattern resembles those obtained by conventional methods (except that several additional components present in small amounts can be seen), and the provisional identification of the main components was obtained by comparison with patterns obtained by the Tiselius and filter-paper electrophoretic methods. The second group (II) is characterized by the presence of three proteins (always absent in sera from group I) which migrate between the α_2- and β-globulins, and by the fact that the amount of protein-staining material migrating in the α_1 position is consistently much less in group II sera than in group I sera Evidence suggesting that the additional material in the α_1 position in group I sera represents a distinct protein, or proteins, absent from group II sera, will be presented in the detailed publication

The second group can be further divided into two subgroups (II$_A$ and II$_B$) The distinction between the subgroups is that the αβ proteins present in group II$_A$ sera migrate at a slightly faster rate than the αβ proteins in group II$_B$ sera Typical results obtained with sera from these two groups are presented in the lower two parts of Fig 1 The difference between such sera has been certainly established for only a limited number of those concerned (by comparing sera from the two groups on the same gel) Confirmatory cross-checks on the remaining samples are being undertaken However, on the basis of comparisons of the individual stained gels in which the αβ proteins can be seen, there is no reason for doubting the validity of the subdivision, nor was any difficulty experienced in assigning each serum to a definite group.

The number of sera in each group was found to be group I, 10 , Group II$_A$, 21 ; group II$_B$, 12

No correlation appears to exist between the serum group and the blood group (*O*, *A*, *B*, *AB*, Rh^+ and Rh^-) of individuals, and there is no significant difference in the distribution of the serum groups for the two sexes ($\chi^2 = 3\ 2$, $P = 0\ 2$)

As judged by the present results on forty-three individuals, the groups are quite discrete , but the possibility remains that intermediate types might be encountered on extending the survey A further possibility remains to be investigated more fully, namely, whether the serum group for a given individual is a permanent feature or is related to past infections My own serum showed no change of group in six months, and that from several other individuals showed no group change over much shorter periods If the constancy and discreteness of these serum groups can be confirmed, hereditary factors must be investigated

Long-Term Transplants of Infantile Rat Pituitaries cultivated *in vitro* and grafted in the Anterior Eye Chamber of Young Cats

During the past few years, we have made a number of attempts to obtain successful grafts between widely unrelated species of mammals In most of these experiments the rat was used as the donor of the graft and the cat, an animal known for its refractoriness to foreign proteins, as receptor The anterior eye chamber was chosen as the site of transplantation. In every experiment the anterior pituitary of 17-day old rats served as the graft, and kittens of between 21 and 60 days as graft receptors In all, six cats with eighteen grafts were used as controls, and seventeen cats with eighty-three grafts as experimental animals Early in the investigation it became evident that normal infantile rat pituitaries transplanted into the eye of the cat failed to survive for long periods With one exception, where the grafted pituitary tissue was still present after thirty-five days, in twenty-four days the grafts were completely resorbed, although in every case vascular connexion with the host tissue was established

If, however, the hypophysial tissue previous to transplantation was cultivated *in vitro* for fifty to sixty days at a temperature of 33–34° C in a medium containing extract of young chicken embryos (seven to nine days old)[1] the transplants survived for much longer periods (Fig 1) Even better results were obtained if the cultivated gland was first transplanted into the eye of the rat, then cultivated *in vitro* for a second time and finally grafted into the cat The length of survival of these grafts has no yet been determined, but we have some which afte three and four months of life in the host anima look quite healthy (Fig 2) In an 86-day old double explant-graft of the type described above, numerou dividing chromophobes were observed (Fig 3), and in a simple 59-day old explant-graft some dividing cells have also been found

We must emphasize the fact that we are not dealing here with an all-or-nothing reaction Some grafts both of the normal and explanted tissue, live fo longer and some for shorter periods, but on the whole, explant-grafts survive much longer than norma grafts Some double explant-grafts, however, seem capable of indefinite survival

At this stage it would be premature to speculate on the factors responsible for the prolonged surviva of grafts cultivated *in vitro* The impression is gained that more than one phenomenon is involved It would perhaps, be reasonable to assume that the chicken embryo extract exercises, in some still unknown way a protective influence upon the grafted tissue, or in other words reduces the antigenic power of the graft It is known that the anterior eye chamber present an exceptionally favourable grafting site for many kinds of tissues This may be partly due to th considerably lower temperature prevailing there in comparison with the body as a whole, it will b recalled that the incubating temperature *in vitr* was also subnormal (33–34° C)[2] Moreover, in th eye a large portion of the graft surface lies completely free, that is, not surrounded and compressed by othe tissues It is also possible that the type of biochemica reactions that take place in the eye of the host ar not injurious to the transplant We have noted on further phenomenon that may play a part in the success of grafting, namely, that after prolonged cultivation *in vitro* the gland becomes considerably tougher than the normal pituitary of comparable age

In any event, some sort of non-specific adaptation seems to play the chief part in overcoming the humora specificity of the host This view is supported by the facts that survival of the graft is promoted by cultivation in the embryo extract of a species belonging to a different class of animals, and that explant-heterotransplants that for a time have lived in the eye o

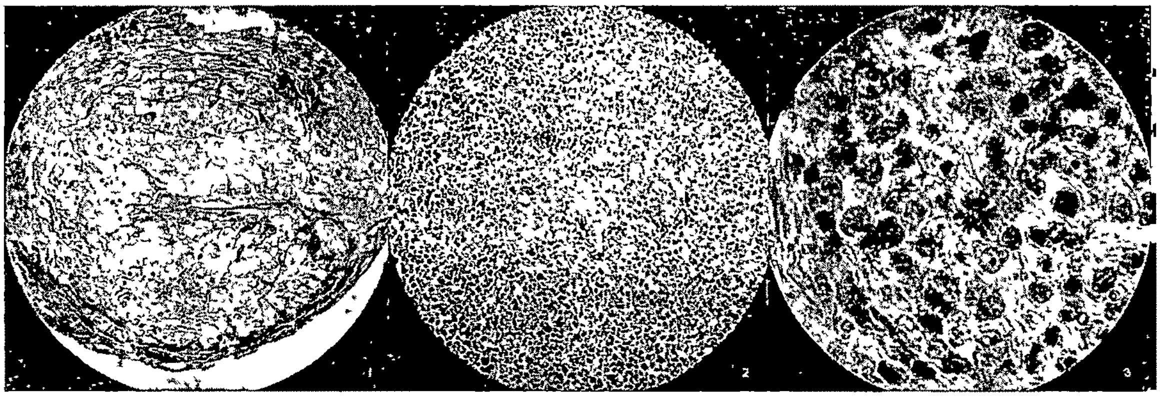

Fig 1 Anterior pituitary of a 17-day old rat grown for 56 days *in vitro* and 59 days in the anterior eye chamber of a 30-day old kitten × 80

Fig 2 Anterior pituitary of a 17-day old rat cultivated *in vitro*, then grown for 128 days in the anterior eye chamber of a hypophysectomized rat, again cultivated *in vitro* (10 days) and transplanted into the anterior eye chamber of a cat two months old, where it was maintained for 121 days × 80

Fig 3 A dividing chromophobe in the anterior pituitary explant-transplant of a 17-day old rat, cultivated *in vitro*, 128 days in the anterior eye chamber of a hypophysectomized rat, 10 days *in vitro* for a second time, and 86 days in the eye of a cat two months old × 380

the rat lived so long when transplanted into the cat. Further work is in progress

Paratyphoid-A Phage Typing

PHAGE-TYPING of typhoid and paratyphoid-B bacilli is now generally recognized as an indispensable aid in the control of typhoid and paratyphoid-B fever and is carried out in many countries according to internationally agreed standard methods[1]. On the other hand, the development of a useful typing procedure of *Salm paratyphi A* has been long delayed.

In 1948, Felix and Banker made an attempt to evolve a typing scheme of *Salm paratyphi A* similar to that which was first devised by Craigie and Yen[2] for the typing of *Salm typhi* The bacteriophage chosen for this purpose had been isolated in 1943 by the late Prof R. G Dhayagude from a sample of sewage in Bombay The original phage (referred to below as Bombay phage or Type 1 phage), used in very high dilutions, lysed 83 out of 132 strains of *Salm paratyphi A* isolated in distant parts of the world The remaining 49 strains were all insusceptible Only one adapted phage preparation was obtained in the course of the investigation of these insusceptible strains The adaptation had occurred on a strain isolated in southern Palestine in 1925, and the epidemiological significance of the change thereby produced in the Bombay phage was demonstrated by the fact that cultures isolated from a patient who had acquired the infection in the same locality in 1947 were found to be fully susceptible to the adapted phage (Type 2) but were resistant to the original Bombay phage[3,4]

The original and the adapted phage were afterwards employed in the routine typing of cultures freshly isolated from cases of paratyphoid-A fever occurring in Bombay and in other parts of India, but all attempts at identifying further phage types of *Salm paratyphi A* remained for a long time unsuccessful At the Sixth International Congress for Microbiology (Rome, 1953) it was reported that no further progress had been made[5]

More recently, two further adaptations of the original Bombay phage were carried out, one to a strain isolated in India (received from the Haffkine Institute, Bombay), the other to a strain isolated in Egypt (received from Commander S Barnes, U S Navy, Washington) This made it possible to subdivide *Salm paratyphi A* into four different phage types which can be easily distinguished from one another (see Table 1)

The typing scheme outlined in Table 1 is very similar to those in general use for the typing of *Salm typhi* and *Salm paratyphi B* The first place in the scheme has been assigned to the type of organism that is sensitive to the original phage and to all the adapted phage preparations derived from it. The remaining types are all characterized by their particular sensitiveness to the homologous adapted-type phage. However, on the basis of experience gained from the phage typing of *Salm typhi* and *Salm paratyphi B*, it may be predicted that future extension of the simple scheme presented in Table 1 will reveal the occurrence of cross-reactions between different phage types and will necessitate further subdivision into subtypes or varieties

The original Bombay phage at first appeared to be strictly specific for strains of *Salm paratyphi A* and was referred to by Felix[4] as a *Vi* phage acting on the specific *Vi* antigen of *Salm paratyphi A*[6] Afterwards it was found that both the original Bombay phage and the adapted Type 2 phage also lysed a number of strains of *Salm gallinarum* and *Salm pullorum*, organisms which do not contain the *A Vi* antigen. The Bombay phage, therefore, is to be considered to be an *O* phage, and the conclusion is that the phenomenon of 'adaptability' is not restricted to *Vi* phages but is one of much wider application (Felix, personal communication) The fact that the Type 2, Type 3 and Type 4 phages listed in Table 1 are fully neutralized by antiserum to Type 1 phage confirms that all these phages represent genuine adaptations of the original Bombay phage.

Thanks to the help of Dr A Felix, joint chairman and secretary of the International Committee for Enteric Phage Typing, and of many workers in different parts of the world, it has been possible to examine within a short time paratyphoid-A strains isolated in countries in all five continents It is of especial interest to note that out of more than five hundred strains examined with the four typing phages so far available, less than 10 per cent remained untypable This seems to indicate that the total number of existing phage types of *Salm paratyphi A* is not as great as that of *Salm typhi* It is known that in many parts of the world the proportion of untypable typhoid strains still continues to be greater than 10 per cent, although more than thirty different phage preparations are now being employed in the typing of this organism[5] The most common phage type of the paratyphoid-A bacillus so far encountered is Type 1 It is too early to state what is the relative frequency of the other three types

Paratyphoid-A infection is almost non-existent in Europe and America, but it is indigenous to many parts of Asia, especially India, Pakistan, Indo-China, Indonesia and other island groups of Oceania, it also occurs in Egypt and other countries of North Africa Although not so prevalent as typhoid fever in many of these regions, the incidence of paratyphoid-A fever is sufficiently high to be rated as endemic Dhayagude and Banker[7] estimated that only about 10 per cent of the enteric fever cases treated in Bombay hospitals during 1948–49 were due to *Salm paratyphi A*, the remaining being caused by *Salm typhi* However, the true incidence of

Table 1 PROVISIONAL TYPING SCHEME OF *Salm paratyphi A* ACCORDING TO FELIX AND BANKER

Type strains of *Salm paratyphi A*		Bacteriophage preparations			
		Type 1	Type 2	Type 3	Type 4
		Test dilutions			
Type	Isolated	1/20,000	1/20,000	1/10,000	1/4,000
Type 1	Bombay	*CL*	*CL*	*CL*	*CL*
Type 2	Palestine	—	*CL*	—	—
Type 3	India	—	—	*CL*	—
Type 4	Egypt	—	—	—	*CL*

CL, confluent lysis with standard loopful of test dilution of phage
—, no plaques

paratyphoid-A infection in India and in other endemic areas is not yet known and may well be much higher than that estimated for Bombay. There can be little doubt that the phage-typing method used as an epidemiological tool will prove to be an indispensable aid to the ultimate control of this infection

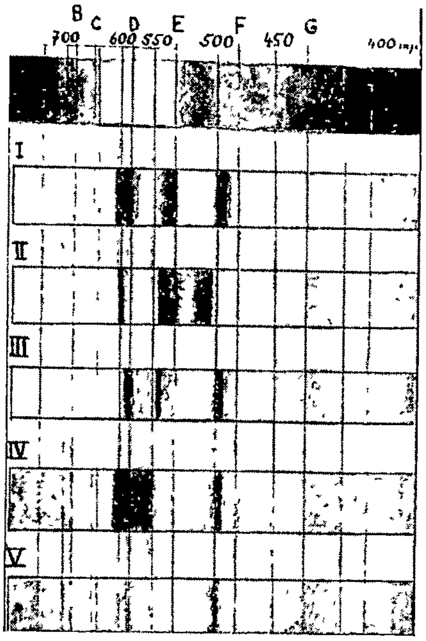
Nature of the Pigment of *Aplysia depilans*

BY heating an aqueous solution of the actual excretion of the Mediterranean sea-slug *Aplysia depilans*, the violet pigment is separated from its protein part The colour of the aqueous solution varies conformably with the *p*H, from blue (*p*H 1–2) to garnet red (*p*H 8–12 0)

The chloroform solutions of this pigment exhibit maxima at 6100, 5350, 4975 and 3800 A (spectrum I), and they yield violet, red and green zones upon a column of powdered sugar The violet pigment is absorbed in the top of the column, while the red is absorbed in the middle part, and the green pigment, travelling faster, at the end of the column

Elution with chloroform–ethanol mixture (2 1) the chromatographically separated violet pigment exhibits maxima at 5860, 5290, 4925 A , and its zinc complex salt at 6280, 5927, 5440 and 5040 A. (III) The red pigment shows maxima at 5910, 5315 and 5007 A Its zinc complex salt shows maxima at 5950 5500 and 5015 A. (II) The third greenish-blue pigment shows no absorption maxima in the visible range, but an extinction of colour in the violet and red regions of the spectrum. Unfortunately, because of its very low concentration, we could not distinguish absorption bands.



The ethanolic solutions of all three pigments separated show intensive red-brownish fluorescence The chloroform solutions of the actual pigment, as well as the solutions of the three pigments separated, become dark blue when treated with a stream of dry hydrogen chloride This blue chloroform-soluble pigment exhibits maxima at 5950, 5475 and 4927 A (IV), and gives with zinc acetate a reddish-brown fluorescence with maximum at 5982, 5495 and 5055 A and simultaneous extinction in the red and violet regions. After several hours, the blue pigment becomes greenish, and its spectrum shows an intense extinction in the red to 5583 A , with only a maximum at 4955 A (V) , its zinc complex salt exhibits maxima at 6255 and 4983 A

The Gmelin reaction of these compounds is negative or very atypical. This fact, in combination with the red fluorescence, suggests that they are porphyrin in nature[1] They do not behave like bilichromes[2].

Details of this work will be published in the *Bulletin of the Academy of Sciences, Athens*

Peculiar Stratified Shape of Typhoon Waves

WHILE M.V. *Tancred* of the Barber Line was riding out the typhoon of early October 1954 in Kobe Bay, we were able to observe a unique shape of typhoon wave which, so far as we know, has not been described. The vessel was hove-to with two anchors down facing the incoming gale (133 km /hr) and the waves with crests up to 10 and 15 ft were passing neatly along her side. From the rail we were struck by the peculiar appearance of the wave-slopes facing the wind

On many of these there were a number of well-defined steps, carved so to say into the water just like the steps of a ladder, starting from the trough of the wave up to about half its height. Although the waves were moving quickly the steps remained steady, extending parallel to each other for one or two metres in length There were at times as many as twenty of these nicely successive steps cut into the body of the wave. We tried to photograph them, but the very poor visibility and the fast motion of the waves resulted only in a blurred print

Were these steps carved in the wave slopes by high harmonics of the period of the typhoon squalls ? These higher harmonics have been registered by sensitive modern microbarographs, and they might have something to do with the quite peculiar screaming of the wind, often reported by seamen during the squalls of tropical storms. Strangely enough, this peculiar whistling has never been noticed in the squall line of extratropical storms

FORTHCOMING EVENTS

(*Meetings marked with an asterisk * are open to the public*)

Monday, February 14

University College London (in the Physiology Theatre Gower Street, London, W C 1), at 4 45 p m —Dr Esmond E Snell (University of Texas) "The Relationship of Structure to Catalytic Activities of Vitamin B_6" *

British Society for the History of Science, Philosophy of Science Group (in the Joint Staff Common Room, University College, Gower Street, London, W C 1), at 5 30 p m —Prof D J O'Connor "Determinism and Predictability"

Institution of Electrical Engineers, Education Discussion Circle (at Savoy Place London, W C 2) at 6 p m —Discussion on "Teaching Faraday's Law of Electromagnetic Induction"

Pharmaceutical Society of Great Britain (at 17 Bloomsbury Square London, W C 1), at 7 30 p m —Dr K R Capper "The British Pharmaceutical Codex 1954 and the National Formulary 1955"

Tuesday, February 15

Institute of Physics, Electronics Group (at 47 Belgrave Square, London, S W 1), at 5 30 p m —Mr R W Douglas "Properties of New Semi-Conductor Materials"

Institution of Civil Engineers (at Great George Street, London, S W 1), at 5 30 p m —Mr Fred Tattersall, Mr T R M Wakeling and Mr W H Ward "Investigations into the Design of Pressure Tunnels in London Clay"

Institution of Electrical Engineers, Measurements Section (at Savoy Place, London, W C 2), at 5 30 p m —Mr W E Harris Informal lecture on "The Service Engineer at an Atomic Energy Establishment"

Society of Chemical Industry, Agriculture Group (at the Chemical Society Burlington House, Piccadilly, London, W 1), at 5 30 p m —Mr B M Church "Recent Aspects of Fertilizer Practice", Dr G W Cooke "Present Fertilizer Practice and Future Possibilities"

University of London, British Postgraduate Medical Federation (at the London School of Hygiene and Tropical Medicine, Keppel Street, London, W C 1), at 5 30 p m —Prof J N Davidson "Nucleoproteins in Cell Structure" (From a Series of Lectures on "The Scientific Basis of Medicine")*

University of London (in the Anatomy Theatre, University College Gower Street, London W C 1), at 5 30 p m —Mr W K Taylor "A Mathematical Model of Neuronal Interaction" *

Royal Aeronautical Society, Graduates' and Students' Section (at 4 Hamilton Place, London, W 1), at 7 30 p m —Discussion—"Is Postgraduate Study Abroad Worthwhile ?" Chairman Sir Arnold Hall F R S

Wednesday, February 16

Institute of Metals, Metallurgical Engineering Committee (at the University, Edgbaston, Birmingham), at 10 30 a m —Informal discussion on "The Treatment of Swarfs, Sawings and Residues in the Non-Ferrous Metal Industries"

Royal Meteorological Society (at 49 Cromwell Road, South Kensington London, S W 7), at 5 p m —Dr E B Kraus "Meteorology in a Large Water Engineering Project".*

Royal Statistical Society (at the London School of Hygiene and Tropical Medicine, Keppel Street, London, W C 1), at 5 15 p m —Discussion on "The Teaching of Mathematical Statistics at University Level"

Eugenics Society (at the Royal Society Burlington House, Piccadilly, London, W 1), at 5 30 p m —Mrs Judith Hubback "The Fertility of Educated Women" *

Royal Microscopical Society (at Tavistock House South, Tavistock Square, London, W C 1), at 5 30 p m —Dr E S Horning "Hormones in Relation to Cancer"

Royal Institute of Chemistry (in the Chemistry Lecture Theatre, King's College, Strand, London, W C 2), at 6 30 p m —Prof Sir E C Dodds, F R S "Some Recent Advances in Biochemistry"

Society of Chemical Industry, Corrosion Group (at the Chemical Society, Burlington House, Piccadilly, London W 1), at 6 30 p m —Discussion on "Corrosion Prevention in the Home"

Thursday, February 17

Royal Society (at Burlington House, Piccadilly, London, W 1), at 4 30 p m —Scientific Papers

University College, London (in the Physiology Theatre, Gower Street London, W C 1), at 4 45 p m —Dr S R Elsden "Respiratory Mechanisms in Bacteria" * (Further Lectures on February 24 and March 3)

Institution of Mining and Metallurgy (at the Geological Society of London, Burlington House, Piccadilly, London, W 1), at 5 p m —Scientific Papers

Linnean Society of London (at Burlington House, Piccadilly, London, W 1) at 5 p m —Prof Irene Manton "Flagella Structure Based on Observations with the Electron Microscope", Dr J R G Bradfield "Fibre Patterns in Animal Cilia and Flagella"

Institution of Electrical Engineers, Utilization Section (at Savoy Place, London, W C 2), at 5 30 p m —Mr P J Bhatt "An Introduction to the Study of Servo-Mechanisms", Mr E J Davies "The Development of 50 c/s Traction in France", Mr G Gascoigne "Electricity Applied to Oil Production"

University of London, British Postgraduate Medical Federation (at the London School of Hygiene and Tropical Medicine, Keppel Street, London, W C 1), at 5 30 p m —Prof J H Gaddum, F R S "The Effects of Alcohol" * (From a series of lectures on "The Scientific Basis of Medicine")

Society of Chemical Industry, Road and Building Materials Group (in the Lecture Hall of the Institution of Structural Engineers, 11 Upper Belgrave Street, London, S W 1), at 6 p m —Dr R N J Saal (Amsterdam) "A Study on the Significance of the Bitumen Ductility Test"

Royal Aeronautical Society (at 4 Hamilton Place, London, W 1), at 7 p m —Mr H L Cox "Problems Associated with Stress Concentration"

Chemical Society (at Burlington House, Piccadilly, London, W 1), at 7 30 p m —Scientific Papers

Royal Society of Tropical Medicine and Hygiene (at [redacted] House, 26 Portland Place, London, W 1), at 7 30 p m —Colonel H W Mulligan "Recent Investigations on Trypanosomiasis in British West Africa"

Friday, February 18

Institute of Navigation (at the Royal Geographical Society, 1 Kensington Gore, London, S W 7), at 5 p m —Mr H C Pritchard "Automatic Dead Reckoning Instruments"

Physical Society, Acoustics Group (at the Royal Festival Hall, South Bank, London, S E 1), at 5 p m —Mr Ralph Downes, Mr C T L Harrison and Dr W H George "Musical and Acoustical Aspects of the Festival Hall Organ"

University of London (in the Physiology Theatre, University College, Gower Street, London, W C 1), at 5 30 p m —Prof F Bergel "Attempts at Chemotherapy of Malignant Diseases" *

Society of Chemical Industry, Chemical Engineering Group (joint meeting with the Fine Chemicals Group, at King's College, Strand, London, W C 2), at 7 p m —Mr W C Peck "Some Applications of Chemical Engineering in the Fine Chemicals Industry", Mr A S D Barrett "Vacuum and Freezedrying"

Royal Institution (at 21 Albemarle Street, London W 1), at 9 p m —Dr J McG Bruckshaw "The Implications of Rock Magnetism"

Saturday, February 19

Biochemical Society (at the London School of Hygiene and Tropical Medicine, Keppel Street, London, W C 1), at 11 a m —Symposium on "The Biochemistry of Vitamin B_{12}"

London County Council (at the Horniman Museum, London Road, Forest Hill, London, S E 23), at 3 30 p m —Mr A J Arkell "The Magical Statuettes of Ancient Egypt" *

APPOINTMENTS VACANT

Applications are invited for the following appointments on or before the dates mentioned

Biochemist (preferably with an honours degree or equivalent qualification) in the Chemical Pathology Laboratory—Prof Gray, Department of Chemical Pathology, King's College Hospital, Denmark Hill, London, S E 5 (February 15)

Lecturer (with a degree or other high qualifications in pure or applied chemistry) in Textile Chemistry and Dyeing—The Registrar Nottingham and District Technical College, Shakespeare Street, Nottingham (February 15)

Lecturer (with a degree or other recognized qualification in geology, together with some practical experience) in Geology—The Registrar, Nottingham and District Technical College Shakespeare Street, Nottingham (February 15)

Assistant Lecturer (with a degree in engineering and/or agriculture with practical experience in farm implements and machinery) in Agricultural Engineering—The Secretary, North of Scotland College of Agriculture, 41½ Union Street, Aberdeen (February 16)

Lecturer in Biology—The Principal, Borough Road College, Isleworth, Middlesex (February 21)

Lecturer in Applied Mathematics—The Registrar, King's College, Newcastle-upon-Tyne (February 28)

Lecturer or Assistant Lecturer in the Department of Botany—The Secretary, Bedford College, Regent's Park, London, N W 1 (February 28)

Lecturer (preferably with a university degree in physical chemistry or chemical engineering) in Chemical Engineering—The Registrar, King's College, Newcastle-upon-Tyne (February 28)

Assistant Lecturer (female) in Mathematics, and an Assistant Lecturer in Physics—The Principal, Royal Holloway College, Englefield Green, Surrey (March 1)

Chair of Anatomy at the University of Sydney, Australia—The Secretary, Association of Universities of the British Commonwealth, 5 Gordon Square, London, W C 1 (Australia, March 1)

Cripps Chair of Production Engineering—The Registrar, The University, Nottingham (March 1)

Research Assistant (trained in physiology and/or biochemistry) in the Department of Anæsthetics—The Registrar, The University Leeds 2 (March 1)

CHAIR OF PUBLIC HEALTH AND SOCIAL MEDICINE—The Secretary, The University, Edinburgh (March 8)

ASSISTANT STATISTICIAN (with a pass degree or equivalent qualification, and preferably with a knowledge of mathematics and horticulture (or botany)) for the examination and analysis of experimental data—The Secretary, East Malling Research Station, near Maidstone, Kent (March 15)

CHIEF LECTURER IN PHYSIOLOGY at the University of Queensland, Australia—The Secretary, Association of Universities of the British Commonwealth, 5 Gordon Square, London, W C 1 (Australia, March 15)

LECTURER or ASSISTANT LECTURER IN GEOGRAPHY at the University of Malaya, Singapore—The Secretary, Inter-University Council for Higher Education in the Colonies, 1 Gordon Square, London, W C 1 (March 15)

CHAIR OF AGRICULTURE, at the School of Agriculture, Sutton Bonington—The Registrar, The University, Nottingham (March 16)

LECTURER Grade 2 (with experience in either experimental or theoretical nuclear physics) IN THE DEPARTMENT OF PHYSICS, and an ASSISTANT LECTURER or LECTURER IN THE SUB-DEPARTMENT OF ACOUSTICS—The Registrar, The University, Liverpool (April 14)

[illegible]TURER or ASSISTANT LECTURER (with a degree in pharmacy, or Fellow of the Pharmaceutical Society) IN PHARMACEUTICS, at the University of Malaya, Singapore—The Secretary, Inter-University Council for Higher Education in the Colonies 1 Gordon Square, London, W C 1 (April 15)

I C I RESEARCH FELLOWS IN BIOCHEMISTRY, CHEMISTRY, CHEMOTHERAPY, ENGINEERING, METALLURGY, PHARMACOLOGY, PHYSICS or allied subjects—The Academic Registrar, University of London, Senate House, London, W C 1 (April 16)

TURNER AND NEWALL RESEARCH FELLOWS IN ENGINEERING, INORGANIC CHEMISTRY, PHYSICS or an allied subject—The Academic Registrar, University of London, Senate House, London, W C 1 (April 16)

ASSISTANT LECTURER (with good academic qualifications, and appropriate teaching and other experience) IN PHYSICS, at Flintshire Technical College—The Director of Education, County Education Offices, Mold, Flintshire

CHEMISTS (Scientific Officer grade) IN THE BIOCHEMISTRY DEPARTMENT, to help in research on the formation of heterocyclic compounds in plants—The Secretary, Rothamsted Experimental Station, Harpenden, Herts

EDITORIAL ASSISTANT (with a knowledge of chemistry)—The General Secretary, Society of Chemical Industry, 56 Victoria Street London, S W 1

GENERAL EXPERIMENTAL PHYSICIST, Principal Scientific Officer or Senior Scientific Officer grade (with at least a first- or second-class honours degree in physics and several years general physical research experience), with the United Kingdom Atomic Energy Authority, Foulness, Essex, for the investigation of detonation phenomena—Senior Recruitment Officer, Atomic Weapons Research Establishment, Aldermaston, Berks, quoting 328/WGE/2

HEAD (preferably with teaching, industrial and/or research experience) OF THE CHEMISTRY AND APPLIED CHEMISTRY DEPARTMENT—The Principal, Royal Technical College, Salford 5

LABORATORY TECHNICIAN (fully trained in physiological techniques) —The Administrative Officer, Sir William Dunn School of Pathology, University of Oxford

LECTURERS (with a degree or higher national certificate in electrical engineering or physics, and capable of training staff varying from operator to graduate) IN THE ENGINEERING TRAINING DEPARTMENT, Evesham—Engineering Establishment Officer, B B C, Broadcasting House, London, W 1, quoting EX 22N

MATHEMATICIANS (with a first- or second-class honours degree in mathematics, and preferably with some research experience in an applied field) at various Ministry of Supply Research and Development Establishments in Southern England—The Ministry of Labour and National Service, Technical and Scientific Register (K), 26 King Street, London, S W 1, quoting A 28/5A

PLANT PHYSIOLOGIST (with at least four years experience beyond the doctorate level in plant physiology, plant biochemistry or cytology (other than cytogenetics)) IN THE DIVISION OF APPLIED BIOLOGY, National Research Council, Ottawa, for fundamental research on problems of photosynthesis and related metabolism, translocation, tissue culture or cell physiology, to be carried on independently or in collaboration with others—The Director, Division of Applied Biology, National Research Council, Ottawa, Ontario, Canada

PRINCIPAL (with high academic qualifications and appropriate educational and administrative experience) OF THE NORTHERN POLYTECHNIC—Clerk to the Governing Body, Northern Polytechnic, Holloway, London, N 7

RESEARCH ASSISTANT (female), Assistant Experimental Officer or Scientific Officer grade, for duties which are concerned with research on serology of viruses—The Secretary, Foot-and-Mouth Disease Research Institute, Pirbright, Surrey

RESEARCH FELLOW IN THE DEPARTMENT OF CHEMISTRY for work on the mechanisms of changes produced in polymers by radiations—The Secretary, The University, Edgbaston, Birmingham 15

SENIOR LABORATORY ASSISTANT (with good industrial or other laboratory experience, and able to undertake the supervision of juniors) IN THE CHEMISTRY SECTION of the Department of Applied Science—The Principal, Wolverhampton and Staffordshire Technical College, Wulfruna Street, Wolverhampton

SENIOR SCIENTIFIC OFFICER (with at least a second-class honours degree in metallurgy or equivalent, and with three years postgraduate research experience), at Sellafield, Cumberland, to undertake metallographic studies with particular reference to the behaviour of materials under irradiation and to welding of rare metals—United Kingdom Atomic Energy Authority, Industrial Group Headquarters, P O Box 19, Risley, Warrington, quoting 796

TECHNICIAN IN THE BIOLOGICAL SECTION of the Department of Clinical Endocrinology, for duties which will include routine biological assays and assistance with biological research—The House Governor, Birmingham and Midland Hospital for Women, Showell Green Lane, Sparkhill, Birmingham 11

New Books

Electrolyte Solutions

By R A ROBINSON, D Sc, Ph D, F R I C, *Professor of Chemistry, University of Malaya, Singapore,* and R H STOKES, Ph D, D Sc, F R A C I., A R I C, *Reader in Physical Chemistry, University of Western Australia*

A detailed account of the present state of knowledge of some of the most fundamental properties of electrolytes, conductance, chemical potential and diffusion, from the standpoint of the practical electrochemist

Modern experimental methods are discussed at some length, and extensive results are given, together with numerous tables useful in computations on electrolyte solutions

Price 56s.

Fundamentals of Radiobiology

By Professor Z M BACQ, University of Liège, and P ALEXANDER, Ph D, Chester Beatty Research Institute

This book, written by a biologist and a physical chemist in collaboration, presents a balanced and coherent account of our present state of knowledge of radiobiology The importance of the subject for radiotherapists using radiation in the treatment of cancer, the necessity of avoiding the hazards to the health of the community in this age of nuclear fission, and the value of radiation in fundamental research on the cell have caused a great increase of late years in the number of those engaged in radiobiology, and this number is rapidly increasing This survey of the field as a whole therefore appears at an opportune time It will enable the specialist to assimilate developments in fields adjacent to his own and appreciate their possible effects on his particular work, and will provide those newly entering the field with a guide and an assessment of the present state of research Price 40s.

The engagement of persons answering these advertisements must be made through a Local Office of the Ministry of Labour or a Scheduled Employment Agency if the applicant is a man aged 18 *to* 64 *inclusive, or a woman aged* 18 *to* 59 *inclusive unless he or she, or the employment, is excepted from the provisions of the Notification of Vacancies Order* 1952

COMMONWEALTH AGRICULTURAL BUREAUX

COMMONWEALTH INSTITUTE OF ENTOMOLOGY

Applications are invited for an appointment as Acarologist, whose principal duty will be the determination of phytophagous and predatory mites of economic importance, but who would also enjoy excellent opportunities for general systematic work in the Acarina Candidates are sought who show evidence of special interest or achievement in this field The successful candidate would work in the British Museum (Natural History) London The salary will be in a scale that rises from £530 by annual increments to £1,540 per annum with efficiency bars at £855 and £1,150 There is also a pay supplement that runs from £25 at £530 to £35 at £900 to £1,500 The starting salary will be determined by age, qualifications and experience Superannuation will be provided for under the F S S U

The closing date for applications is April 30 1955, and full details of the appointment and methods of application can be obtained from the Director, Commonwealth Institute of Entomology, 41 Queen's Gate, London, S W 7

UNIVERSITY OF DURHAM

KING'S COLLEGE NEWCASTLE UPON TYNE

DEPARTMENT OF MATHEMATICS

The Council of King's College invite applications for a Temporary Lectureship in Applied Mathematics The appointment will be for the academic year 1955-56 only and the salary will be determined at a suitable point within the range £650 to £1 350 in accordance with the qualifications and experience of the successful candidate Family allowance and F S S U

Further particulars may be obtained from the undersigned to whom applications (three copies) together with the names of three referees, should be addressed so as to reach him not later than February 28, 1955

G R HANSON,
Registrar of King's College

UNIVERSITY OF DURHAM

KING'S COLLEGE NEWCASTLE UPON TYNE

LECTURER IN CHEMICAL ENGINEERING

The Council of King's College invite applications for a Lectureship in Chemical Engineering Applicants should preferably hold a university degree in physical chemistry or in chemical engineering The initial salary will be fixed at a suitable point on the scale £650 by £50 to £1 350 in accordance with the qualifications and experience of the successful applicant Family allowance and F S S U Duties to commence in October, 1955

Twelve copies of application, together with the names of three persons to whom reference may be made, should be submitted not later than February 28, 1955 to the undersigned, from whom further particulars may be obtained

G R HANSON,
Registrar of King's College

SHORT SERVICE COMMISSIONS IN THE INSTRUCTOR BRANCH OF THE ROYAL NAVY

Applications are invited from university graduates and qualified teachers under 36 years of age for Short Service Commissions of 3, 4, or 5 years in the Instructor Branch, Royal Navy Applications will also be accepted from final year undergraduates, and these will be considered in anticipation of their degree results Requirements are mainly for officers with qualifications in mathematics, science (physics, chemistry, metallurgy), or engineering, but a few vacancies exist for officers with qualifications in history or English with a sound mathematics or science background After two years' service, officers will be eligible for selection for permanent commissions A Short Service engagement in the Instructor Branch will discharge any candidate's obligation under the National Service Acts Entry will be in two grades Selected candidates with first- or second-class honours degrees receive approximately £410 in their first year's service, £429 in second year, £548 in third and fourth years, £584 in fifth year Other candidates receive £319 in first, £392 in second and third years, £429 in fourth and fifth years Previous officer service will be recognized for adjustment of seniority and rate of pay on entry Accommodation and rations are provided or allowances in lieu Married officers if aged 25 or over receive marriage allowance of £338 per annum if not accommodated in official married quarters, £283 per annum if they are so accommodated Married officers under the age of 25 receive marriage allowance of £146 per annum, but are not entitled to be accommodated in official married quarters An initial outfit allowance of £115 is paid, together with a free issue of certain articles of clothing A reduced allowance is payable to candidates with previous Naval Service as officers Tax free gratuities of £300, £400 or £500 are payable at the end of 3, 4 or 5 years respectively Instructor Officers serve both ashore and afloat and their duties include both technical instruction and general education Officers with suitable qualifications may also be trained and appointed for full- or part-time meteorological and weather forecasting duties Service in the Instructor Branch will, in the case of officers who enter from contributory service under the Teachers (Superannuation) Acts, be treated as contributory service, contributions being deducted from the above gratuities Other officers may have their service in the Instructor Branch similarly treated if they so desire

Fuller details and application forms may be obtained from Director (P), Naval Education Service, Admiralty, London, S W 1 Completed application forms should be returned, if possible, before May 31, 1955

UNIVERSITY OF LONDON

The Senate invite applications for the Chair of Applied Science, with special reference to engineering tenable at the Imperial College of Science and Technology (salary not less than £2,100 a year)

Applications (ten copies) must be received not later than March 7 1955, by the Academic Registrar University of London, Senate House W C 1 from whom further particulars may be obtained

LOTHIANS RIVER PURIFICATION BOARD

Applications are invited for the post of River Inspector for the area of the Board Salary is £1,000 by £50 to £1 250 and the statutory qualifications are corporate membership of the Royal Institute of Chemistry and of the Institute of Sewage Purification Candidates with other appropriate qualifications may be considered The superannuation scheme involves medical examination

Applications giving age, qualifications appointments held (with dates and salaries) along with testimonials should reach the Clerk Lothians River Purification Board, City Chambers, High Street, Edinburgh, 1, not later than February 28, 1955

J STORRAR
Clerk of the Board

SENIOR EXPERIMENTAL OFFICER REquired by the United Kingdom Atomic Energy Authority at Sellafield Cumberland to undertake experimental work in metallurgy and physics Qualifications At least higher school certificate in science subjects, or equivalent, with several years' appropriate experience in an industrial laboratory Salary Range £1 090 to £1,285 Contributory pension scheme—Applications to UNITED KINGDOM ATOMIC ENERGY AUTHORITY, Industrial Group Headquarters, P O Box 19, Risley, Warrington quoting 797

UNIVERSITY OF NOTTINGHAM

CRIPPS CHAIR OF PRODUCTION ENGINEERING

Applications are invited for election to th Cripps Chair of Production Engineering, whic has recently been established Present salary £1,850 per annum, but salary scale is und review Overseas candidates who are intereste in the appointment and intend to submit a application should notify the Registrar The Un versity of Nottingham, by cable or by airmai The University gives generous assistance towar travelling expenses to those candidates appointe to Professorial Chairs from overseas

It is the intention that applications should, possible be received not later than Tuesda March 1, 1955

H PICKBOURNE,
Registrar

DUBLIN INSTITUTE FOR ADVANCED STUDIES

The Council of the Institute invites applic tions from university graduates whose degr course included mathematics and/or physics f a post as Technical Assistant in the School Theoretical Physics of the Institute Salary £380 per annum, subject to adjustment based cost of living The duties of the post incluc scientific, secretarial and library work The a pointee will be expected to do such scientific a other typing as may be required and to have, addition to the academic qualifications abov mentioned a knowledge of a modern continent language

Applications (in applicant's own handwriting giving full particulars of age, qualifications, et together with copies only of testimonials shou be sent so as to reach the undersigned on before March 31, 1955

PATRICIA O'NEILL,
Senior Clerk

64 Merrion Square,
Dublin

UNIVERSITY OF LIVERPOOL

Applications are invited for the following Fe lowships (i) I C I Research Fellowships Physics, Chemistry, Engineering, Metallurgy a Pharmacology, or any related subject, to whi some appointments may be made during the cu rent academic year The appointments will da from October 1, 1955 The salary will depe upon qualifications and experience but will no mally be within the range £600 to £900 per annu together with F S S U benefits and family allo ances (ii) Two Leverhulme Postgraduate F lowships in the Faculty of Science tenable f one year at a value of £500, renewable for second year at a value of £550

Applications, three copies, stating the Fello ship applied for age, details of qualifications a experience, publications, research work in progr and completed, and an outline of the propos field of research and in the case of the Lev hulme Fellowships, whether National Service quirements have been fulfilled together with names of two referees, should be received later than March 1, 1955 by the undersign from whom further particulars may be obtain (Candidates overseas who find it more conveni to do so may send one copy only by airmail)

STANLEY DUMBELL
Registrar

UNIVERSITY OF LIVERPOOL

Applications are invited for the following p in the Department of Physics (i) Lecturer (Gr II) for which candidates should have had exp ence in either experimental or theoretical nucl physics, (ii) Assistant Lecturer or Lecturer in Subdepartment of Acoustics, at initial sala according to age, qualifications and experie within the ranges current at the time of appo ment for Lecturers and Assistant Lecturers B appointments will commence on October 1, 19

Applications, stating age, academic quali tions and experience, together with the names three referees should be received not later t April 14 1955, by the undersigned, from wh further details may be obtained

STANLEY DUMBELL
Regist

BOROUGH ROAD COLLEGE

ISLEWORTH MIDDLESEX

Applications are invited from men for the of Lecturer in Biology Salary according to Pelham scale of salaries for Training Coll staffs

Full particulars and form of application be obtained from the Principal to whom ap cations must be made by Monday February 2

THE UNITED KINGDOM ATOMIC Energy Authority, Aldermaston, Berks, requires Optical Technicians Post A (517/WGE/34), to carry out process development on production of extremely accurate optical surfaces in a wide variety of materials The surfaces concerned may not be accessible to normal types of polisher and will not necessarily be plane or spherical Candidates should have had a thorough training in glass polishing to quarter-wave standard and some years experience in the instrument industry Experience of working materials other than glass, particularly metals to extreme precision and an experimental approach to problems are essential Post B (516/WGE/34), to carry out process development on aspheric surfaces and on the production of other precision optical components for instruments of the highest performance Candidates should have had a thorough training in glass polishing to a tenth of a wavelength and some years experience in the instrument industry A thorough knowledge of the present day methods of manufacture and testing of high quality non-spherical surfaces is essential Salary £710 (at age 30) to £830 The successful applicants will be required to join the Authority's principal superannuation scheme which is contributory An initial period of detached duty may have to be served at Fort Halstead, near Sevenoaks, Kent Housing accommodation will be available at Aldermaston within a reasonable period for married officers who live outside the radius of the Establishment's transport facilities During this period, lodging allowance may be payable to suitably qualified candidates —Application forms from Senior Recruitment Officer, A W R E, Aldermaston, Berks Quote reference 517/WGE/34 Post A, or 516/WGE/34 Post B

CENTRAL RESEARCH ESTABLISHMENT ational Coal Board) at Stoke Orchard near heltenham where work is concerned mainly with oduction of smokeless fuels from high volatile als for the domestic market and for metallurgical ocesses require Physicists and Mathematicians ith good honours degrees for superannuable ap- intments in the Physics Department This is gaged in fundamental and other studies in sup- rt of technical processes including mechanical haviour of coal fundamental physics of forma- n of brittle coke from coal in its plastic state ysics of thermal treatment of coal application modern methods of solid state physics to re- arches into structure of coal and problems of id mechanics The Mathematician will work a small section engaged in design and ana- sis of laboratory and small scale plant experi- ents for the whole Establishment Some prac- al experience in work of this kind would be advantage The work is varied and interesting d publication of original work in scientific and hnical journals is encouraged Appointments ll be according to qualifications and experience, Scientist I (scale/range £1 150 by £40 to 350 to £1 550 male), Scientist II (scale £800 by 5 to £1 150 male) or Scientist III (scale £500 £25 to £950 male)—Write giving full parti- lars (in chronological order) of age education alifications and experience (with dates), to tional Coal Board, Central Research Establish- nt Stoke Orchard near Cheltenham Glos, rking envelope TT/928 Original testimonials ould not be forwarded Closing date March 2, 55

BRITISH ELECTRICITY AUTHORITY IN- e applications from senior Biologists for a perannuable post in the Chief Engineer s De- rtment in London The successful applicant ll be required to take charge of a small bio- gical laboratory situated in North London and ll be expected to undertake research and to vise the Authority on the effects of power ation operation upon the life of rivers and other aterways Although the post will be based in ndon, the holder may be required to spend ort periods at any power station in the country connection with specific problems Salary with- N J B Grade II £971 to £1 325 per annum clusive according to qualifications and experi- ce—Applications stating age qualifications, ex- rience and present position and salary to rector of Establishments, Winsley Street, ndon W 1, by February 25, 1955 Quote ref E/568

COMMONWEALTH of AUSTRALIA

DEPARTMENT OF SUPPLY
WEAPONS RESEARCH ESTABLISHMENT
SALISBURY, SOUTH AUSTRALIA
SENIOR SCIENTIFIC OFFICER

Salary £A 1,352 to £A 1,442 per annum Duties To undertake design and development of optical systems for special purpose cameras and optical instruments Qualifications A degree in physics or engineering Experience in the design and development of lenses and in the supervision of small optical workshop Where permanent appointment is accepted the successful applicant will be required to contribute to the Commonwealth superannuation scheme Under specified conditions first-class boat fare (if first-class berth available) of the appointee and his dependants (wife and dependent children), will be paid by the Commonwealth Salisbury is situated sixteen miles from Adelaide, the capital of South Australia

Application forms obtainable from The Senior Representative, (A P 27), Department of Supply, Australia House, Strand, London, W C 2, with whom applications should be lodged by March 3, 1955

MATHEMATICIANS REQUIRED AT VARIous Ministry of Supply Research and Development Establishments in Southern England Qualifications First- or second-class honours degree in mathematics preferably with some research experience in an applied field Appointments in Scientific Officer grade Salary range £467 10s to £845 Women somewhat less F S S U benefits may be available Prospects of promotion to Senior Scientific Officer (minimum age 26), within salary range £970 to £1 125 Not established but opportunities to compete for establishment may arise —Application forms from Ministry of Labour and National Service, Technical and Scientific Register (K) 26 King Street, London, S W 1, quoting A28/5A

THE UNITED KINGDOM ATOMIC Energy Authority, Foulness, Essex, requires a General Experimental Physicist in the grade of Principal Scientific Officer or Senior Scientific Officer for the investigation of detonation phenomena The field of work comprises classical physics of high pressures and the temperatures as applied to the behaviour of solid high explosives and inert substances in contact with them Minimum qualifications are first- or second-class honours degree in physics and several years' general physical research experience The salary ranges are Principal Scientific Officer, £1,205 to £1 615 (male) per annum, and Senior Scientific Officer £1 040 to £1,205 (male) per annum The successful applicant will be required to join the Authority's principal superannuation scheme, which is contributory —Application form from Senior Recruitment Officer, A W R E, Aldermaston, Berks Quote Ref 528/WGE/34

THE UNITED KINGDOM ATOMIC Energy Authority, Aldermaston, Berks, requires Scientific Officers for basic research in inorganic and metallurgical chemistry Minimum qualification is first- or second-class honours degree in chemistry, preferably with some research experience of physical chemistry Some knowledge of one of the following is desirable (a) High vacuum techniques as applied to gases and metals (b) Distillation practice and theory (c) Radiochemistry The salary range is £505 to £905 (male) per annum Starting salary will be assessed according to qualifications, age and experience The successful applicants will be required to join the Authority's principal superannuation scheme, which is contributory Housing will be available within a reasonable period for married staff who live outside the radius of the Establishment's transport facilities During this period lodging allowance may be payable to suitable candidates —Application form from Senior Recruitment Officer, A W R E Aldermaston Berks Quote Ref 511/WGE/34

THE UNITED KINGDOM ATOMIC Energy Authority Aldermaston, Berks, requires an Engineer (basic grade) for the engineering of special electronic and light mechanical equipment to meet scientists' requirements, and progressing to final small scale production Applicants should have served a recognized apprenticeship and be corporate members of the Institution of Electrical and Mechanical Engineers, or have exempting qualifications They should have a knowledge of special purposes electronic equipment (such as oscilloscopes employing high speed time bases, pulse generators video amplifiers and stabilized power supply units) A knowledge of the mechanical design problems associated with the manufacture of electronic equipment would be an advantage The salary scale is £695 (linked to age 25) to £1,065 (male) per annum The successful applicant will be required to join the Authority s principal superannuation scheme, which is contributory Housing will be available within a reasonable period for married officers who live outside the Establishment's transport facilities During this period lodging allowance may be payable to suitably qualified candidates —Application form from Senior Recruitment Officer, A W R E, Aldermaston, Berks Quote Ref 510/WG /34

SENIOR SCIENTIFIC OFFICER REQUIRED by United Kingdom Atomic Energy Authority at Sellafield, Cumberland, to undertake metallographic studies, with particular reference to behaviour of materials under irradiation and to welding of rarer metals Qualifications At least second-class honours degree in metallurgy, or equivalent, with three years' postgraduate research experience A wide general experience, particularly in microscopical metallography of ferrous and non-ferrous metals and light alloys is desirable Salary range £1,040 to £1 205 Contributory pension scheme —Applications to UNITED KINGDOM ATOMIC ENERGY AUTHORITY Industrial Group Headquarters P O Box 19, Risley, Warrington, quoting 796

COMMONWEALTH of AUSTRALIA

APPOINTMENT NO 462/69 OF RESEARCH OFFICER

The Commonwealth Scientific and Industrial Research Organization invites applications for appointment to a position of Research Officer (Chemist or Biochemist), Biochemistry Unit, Wool Textile Research Laboratories Melbourne Duties To take part in a programme of research on cellulose-destroying fungi with special reference to the nutritional requirements of particular moulds the nature of the enzymes produced and their mode of action on cellulose Qualifications University honours degree in science, with chemistry, botany or biochemistry as major subjects, and preferably with some research experience in mycology Salary Dependent on qualifications and experience, commencing salary will be determined within the range of Research Officer, £A 1,058 to £A 1 412 per annum actual, thirteen increments with efficiency review at £A 908 and £A 1,064 per annum nominal Salary includes a cost of living adjustment of £A 198 per annum Fare to Australia (including those of wife and family will be paid) The appointment is subject to satisfactory medical examination and the appointee may be granted superannuation privileges

Applications referring to appointment No 462/69, and stating full name, place date and year of birth marital state, nationality, present employment, particulars of qualifications and experience, and of war service if any, accompanied by copies of not more than four testimonials, and names and addresses of two persons willing to act as referees if so required should reach the undersigned not later than March 19, 1955

W IVES
Chief Scientific Liaison Officer
Australian Scientific Liaison Office,
Africa House,
Kingsway London, W C 2

GLASSHOUSE CROPS RESEARCH INSTITUTE

RUSTINGTON, SUSSEX

The Governing Body of the Institute invite applications for the post of Director The Institute, which is carrying on the work of the Experimental Research Station, Cheshunt, is being established on a new site in Sussex, where a large part of the laboratory and glasshouse accommodation has still to be built It is proposed to make the appointment in advance of the retirement of the present Director, so that the selected candidate will as Director-Designate be available to assist in planning the further development of the Institute prior to his assumption of the Directorship Candidates must have high attainments in one of the basic sciences relevant to the work of the Institute and should preferably have experience of horticultural crops The appointment will be in the Deputy Chief Scientific Officer scale £1 950 to £2 125 with superannuation under F S S U, and this scale would for a suitable candidate, be applicable also during the period as Director-Designate The appointment may take effect from October 1, 1955, following a final selection to be made in April or May

Applications to be made before April 15 to the Secretary, Glasshouse Crops Research Institute, Worthing Road Rustington, Littlehampton, Sussex

---

DEPARTMENT OF SCIENTIFIC AND INdustrial Research require Assistant Experimental Officers at the Road Research Laboratory Harmondsworth, Middlesex, as follows Physicist for laboratory research on flow of water in relation to drainage systems (Ref A192/54A), Civil Engineer for field investigation on surface drainage (Ref E31/5/A), Engineer or Physicist for research on soil stabilization (Ref E32/5/A), Engineer or Physicist for full-scale experiments with bituminous materials and for research on bituminous road-making machinery (Ref E33/5/A), Woman to assist head of research section on technical and administration matters and secretarial work in connection with research committees Experience of committee work an advantage (Ref F860/54A) Candidates should be at least 18 and have general certificate of education with two scientific subjects at advanced level or equivalent Pass degree, higher national certificate or equivalent is generally expected if over 22 Inclusive annual remuneration for a 45½-hour week within the following range according to age £304 to £674 (men) £304 to £571 (women) Prospects of establishment for candidates under 28—Application forms from Ministry of Labour and National Service, Technical and Scientific Register (K), 26 King Street London, S W 1 quoting appropriate reference Closing date February 26, 1955

SOUTHERN RHODESIA FORESTRY COMMISSION

FOREST OFFICERS AND FORESTERS

Foresters Applicants must be British subjects, under 28, preferably single, who hold a Foresters' Certificate Starting salary £462 to £714 per annum, depending on experience on scale, rising to £1,484 per annum Forest Officers Applicants must be British subjects under 30 preferably single, with a degree in forestry (The Chief Commissioner will be prepared to consider applications from men taking finals in June, 1955) Starting salary £624 to £984, depending on qualifications and experience, on scale rising to £1,698 per annum Allowances Marriage £50 per annum, children's £60 per annum, first, £24 per annum, each other dependent child payable in both posts

Application forms and further details from the Secretary, Rhodesia House, 429, Strand, London, W C 2 Completed forms to be returned by February 20

INSTITUTE OF CANCER RESEARCH

ROYAL CANCER HOSPITAL

A vacancy exists for a Chemical Technician in the new Radioisotope Laboratory at the Pollards Wood Research Station, Chalfont St Giles, Bucks Experience in a biological laboratory would be helpful The post is permanent and superannuable, and canteen facilities are available Salary according to age and qualifications

Applications, with names of two referees to be sent to the Institute of Cancer Research, Royal Cancer Hospital, Fulham Road, London, S W 3, marking the envelope "Chemical Technician"

ROTHAMSTED EXPERIMENTAL STATION

HARPENDEN, HERTS

Applications are invited for the post of Head of the Department of Entomology The appointment will be in the Senior Principal Scientific Officer grade (£1,600 by £75(3) by £25 to £1,850) Superannuation F S S U The successful applicant will be required to take up duty on October 1, 1955

Applications, together with names of two persons to whom reference may be made, should reach the Secretary by March 31, 1955

TECHNICIANS FOR NEW ZEALAND DEPARTMENT OF AGRICULTURE

Applications are invited from technicians with experience for work on weedicides at the Invermay Research Station in New Zealand Salary on appointment for applicants with general certificate of education (or equivalent) and six years' experience range from £N Z 555 to £N Z 750, according to experience and qualifications

An appointing officer from New Zealand will interview suitable applicants in London Application forms and general information on conditions of employment may be obtained on request from High Commissioner for New Zealand 415 Strand London W C 2, quoting reference 3/4/40 and mentioning this journal Completed applications to be lodged not later than February 26, 1955

UNIVERSITY OF LONDON

The Senate invite applications for the Readership in Experimental Physics tenable at Queen Mary College (salary £1 300 to £1 500 to £1,700 a year)

Applications (ten copies) must be received not later than March 3, 1955, by the Academic Registrar, University of London, Senate House, W C 1, from whom further particulars should be obtained

---

LONDON TRANSPORT REQUIRE WOMAN Technical Librarian for Director of Research, 55 Broadway Applicants must have previous experience in technical library work, and be either Fellows or Associates of Library Association or possess Diploma of London School of Librarianship, science degree advantageous Salary range £570 to £610 prospects of advancement to £650 Commencing salary according to qualification and experience, medical exam, contributory superannuation scheme after probation, certain free travel facilities—Applications to Staff Officer (F/EV 520), London Transport 55 Broadway S W 1 For acknowledgment enclose addressed envelope

NEW SOUTH WALES DEPARTMENT OF AGRICULTURE

WAGGA, AUSTRALIA

AGRICULTURAL RESEARCH INSTITUTE

CEREAL TECHNICIAN

Applications are invited for the above position Salary in the range £A 897 to £A 1,067 per annum rising to £A 1,271 per annum, subject to specific conditions Appointee will be responsible for th technical work involved in the assessment c wheat quality including laboratory milling, test on dough quality and experimental bread making Experience in this type of work essential Ap pointee should have the Intermediate B Sc c equivalent qualification Science background a advantage Accommodation for married an single men being erected Appointee will b eligible, subject to medical examination, to contr bute to the State Superannuation Fund Shippin ares to Sydney of appointee and family will b paid

Four copies of applications (together with fou copies of testimonials and other supporting doc ments), should be lodged with the Agent-Gener for New South Wales, 56 Strand, London, W C (from whom further particulars can be obtained by March 14, 1955

UNIVERSITY COLLEGE OF NORTH WALES

BANGOR

Applications are invited for the post of Assi tant Lecturer in Physics The present salai scale, which is now under revision, is £450 b £50 to £550 per annum, and in addition the are F S S U benefits and family allowances Th appointment will date from October 1 1955

Twelve copies of the application should rea the undersigned, from whom further particula may be obtained, not later than March 15, 195

KENNETH LAWRENCE,
Secretary and Registrar

INSTITUTE OF BASIC MEDICAL SCIENCES

ROYAL COLLEGE OF SURGEONS OF ENGLAND

BRITISH POSTGRADUATE MEDICAL FEDERATION (UNIVERSITY OF LONDON

Applications are invited for the full-time po of Senior Lecturer in Biochemistry The su cessful candidate will be expected to take pa in the teaching activities of the Department Physiology Facilities for research are availab both in the laboratories of the Department a the Buckston Browne Farm of the Royal Colle of Surgeons Salary will be within the univers scale of £1 000 by £100 to £1,500 per annu together with membership of the F S S U T commencing salary will be determined by t age qualifications and experience of the success candidate

Applications (three copies), together with t names of two referees should be sent not la than March 5, 1955 to Professor David Slon Department of Physiology, Royal College of S geons of England, Lincoln's Inn Fields, W C from whom further particulars may be obtaine

---

UNIVERSITY OF MANCHESTER

There is a vacancy in the Department Chemistry for an Organic Micro Analyst in t Senior Technician grade Salary at a point the scale £490 per annum to £590 per annu with membership of a superannuation scheme

Applications should be sent to the Chief Te nician, The Department of Chemistry The U versity, Oxford Road, Manchester 13

UNITED BIRMINGHAM HOSPITALS

THE CHILDREN'S HOSPITAL, BIRMINGHAM, 16

Applications are invited from men and wom for the appointment of Biochemist (basic grad Candidates should possess a B Sc degree w honours in biochemistry or chemistry or equi lent qualification Whitley Council salary a conditions of service

Applications, with names of two referees sho be sent to the House Governor as soon possible

---

LECTURER IN MATHEMATICS, WI special interests in either hydro- or aero-dynam or in electromagnetic theory required for Octob 1955 For a suitable applicant the appointm will be in the upper range of the salary sc i e £1 000 and upwards—Applications to H of Department of Mathematics, Imperial Colle London, S W 7

APPOINTMENTS VACANT

ELECTRONICS RESEARCH

ENTHUSIASTIC PHYSICS or ENGINEERING GRADUATES required for interesting RESEARCH on ELECTRONIC CIRCUITS and DEVICES in Research Laboratory situated in pleasant rural surroundings near Reading

Every encouragement for visiting other Laboraories, Conferences, etc, and for publication of original work

EXCELLENT OPPORTUNITIES for ADVANCEMENT within the LABORATORY and he VAST ENGINEERING INDUSTRIAL GROUP it serves

Apply, in writing, to Personnel Officer, Re-earch Laboratory, ASSOCIATED ELECTRICAL NDUSTRIES Ltd, Aldermaston Court, ALDERMASTON, Berks

---

SECRETARY–LIBRARIAN

Young lady, competent shorthand-typist, required as Secretary to Research Department engaged in nutrition research and also to be responsible for the departmental library Some knowledge of science is essential and some ibrary experience would be an advantage Five-day week, starting salary £400 to £500 per annum according to experience

Apply in writing, giving age and full details of previous experience, to Research Department, Bovril Limited 148 Old Street, E C 1

ARTHUR GUINNESS, SON & CO (DUB-in) Ltd have a vacancy for a Chemist in their Brewing Research Laboratory, Dublin, to work on general analytical and brewing research problems Candidates should possess a good honours degree in chemistry, and some post-raduate experience Salary according to qualifications and experience There is a non-contributory pension scheme and other benefits — Applications giving full details of qualifications and experience should be addressed to the Chief Chemist, Arthur Guinness Son & Co (Dublin), td, St James's Gate, Dublin

---

ARTHUR GUINNESS, SON & CO (DUB-in) Ltd require a Chemist or Biochemist for heir Brewing Research Laboratory in Dublin The post will be a responsible one and will offer ample scope and prospects to one interested in biochemical research work Candidates should e under thirty years of age and possess a good onours degree in chemistry or biochemistry and ostgraduate experience in research work Know-dge of enzymology would be an advantage A ood salary will be offered and there is a non-ontributory pension scheme, and other benefits Applications giving full details of qualifica-ons and experience should be addressed to the Chief Chemist Arthur Guinness, Son & Co Dublin) Ltd, St James's Gate Dublin

---

MAY & BAKER LTD, DAGENHAM, sex, have a vacancy for a young graduate in eir Biological Control Department The post volves mainly biological standardization of emotherapeutic substances —Apply initially, in iting stating age and qualifications, to the rsonnel Officer, quoting reference No 69

ENGLISH CLAYS LOVERING POCHIN & Ltd St Austell, Cornwall, have vacancies the Research Department for (1) an Inorganic emist with postgraduate experience, (2) a aduate Physical Chemist —Application in con-ence to the Research Manager

---

IMPERIAL CHEMICAL INDUSTRIES, LTD, astics Division has two vacancies for Process vestigation Officers The work is that of in-stigation and development of processes operated the manufacturing plants One vacancy occurs a factory in Lancashire and the other at tories on Tees-side Candidates should have good honours degree in chemistry, post-aduate research experience at a university uld be an advantage but is not essential The nbination of experience in the fields of process earch and chemical plant operation would be ticularly useful The desirable age range is (if exempt from National Service) to 30 years age —Applicants are requested to send full ails of their education and experience to the ff Manager I C I Limited Plastics Division ck Fan Road Welwyn Garden City, Herts d to quote reference number N/1

THE EDISON SWAN ELECTRIC CO, Ltd, Cosmos Works, Brimsdown, Enfield, Middlesex, has vacancies in its Research and Development Departments for

1 Development Engineers for work on design and development of thermionic valves
2 Technical Assistants for work in connection with design and development of thermionic valves
3 Mechanical Engineers interested in the problems of mass production associated with thermionic valves

These vacancies are the result of a rapid expansion in the Company's activities The positions are progressive and carry the advantages of a pension scheme

Applicants for vacancies (1) should have an engineering or physics degree but applications from candidates with H N C or equivalent will be considered

Applicants for vacancies (2) and (3) should have ordinary N C or H N C or Inter B Sc or equivalent

The starting salary will be in accordance with the qualifications, experience and age of the applicants

Applications should be in writing and will be treated with the strictest confidence

Apply to the Personnel Superintendent

CHIEF CHEMIST WM MOORHOUSE & Sons Ltd, Sunglow Model Factory, Leeds, require Chief Chemist experienced in Preserves or Food Industry, able to take full analytical and quality control Main specialities Jams, marmalades lemon curd, Christmas puddings mincemeat bottled and canned fruits, jellies This is a senior appointment and carries non-contributory pension —Apply, giving full details present appointment, past record, salary required etc, to Managing Director All applications treated in strictest confidence

---

MONKHOUSE AND GLASSCOCK, LTD Snowsfields London, S E 1, manufacturers of "Monk and Glass" food products, have a vacancy for a chemist, preferably not more than 30 years of age A good degree and experience with foodstuffs are required The successful candidate will be in immediate charge of control and development work under the Chief Chemist The initial salary will depend on qualifications and experience There is a staff pension scheme — Applications, giving full details of career, etc should be addressed to the Chief Chemist

---

GRADUATE CHEMIST OR ENGINEER REquired by Research Association, to apply in members' factories results of research Position suitable young man recently qualified or some experience Good starting salary, excellent prospects Pension scheme —Write particulars training experience to Director British Launderers Research Association The Laboratories, Hill View Gardens, Hendon N W 4

AFRICAN EXPLOSIVES AND CHEMICAL Industries Limited, South Africa, has a limited number of vacancies in its Research Department near Johannesburg for Physical Chemists who have recently graduated with at least honours degree Remuneration will depend upon qualifications —Inquiries should be addressed to Mr R A Webb, African Explosives and Chemical Industries Limited, Imperial Chemical House Millbank London S W 1

SENIOR AND JUNIOR RESEARCH PHYSICISTS, preferably with university or industrial research experience are required to undertake basic research work of thermionic emission and related aspects of surface physics Wide scope and good prospects for men with initiative — Applicants should write to the Manager, Research Department Metropolitan-Vickers Electrical Co Ltd Trafford Park Manchester 17, giving particulars of their age qualifications and experience and suitable references

---

JOSEPH LUCAS LIMITED HAVE AN INTERESTING vacancy in their research and development laboratories which would be suitable for a young graduate with honours degree in mathematics or physics The work is largely of a fundamental nature and is concerned with acoustics and mechanical vibrations Previous industrial experience is not necessary —Please reply giving qualifications age and any other relevant details to Personnel Manager Joseph Lucas (Electrical) Ltd Great King Street, Birmingham quoting reference PM/D/59

DUNLOP RUBBER CO, LTD

The following appointments are offered at the Research Centre, Birmingham

PHYSICIST with good honours degree, is required for a post which offers scope both for the development of factory instruments and for fundamental studies in rubber physics Applications from students who expect to graduate next summer will be considered J M 54

OPERATIONAL RESEARCH GRADUATE required to conduct operational research work in rubber and plastics industry The work will be based on a research laboratory with facilities for statistical and computational work and full modern techniques for investigational work The applicant should either have previous experience in this work or combined laboratory and factory experience J M 55

PHYSICISTS required for fundamental textile research work Applicants should have good honours degree Textile experience is not essential Applications from students who expect to graduate next summer will be considered J M 56

Applications for above positions should be made in writing quoting given references and details of age, qualifications and experience to Personnel Manager, Dunlop Rubber Co, Ltd, Fort Dunlop Erdington, Birmingham 24

MULLARD RESEARCH LABORATORIES

invite applications for two types of permanent positions in its Vacuum Physics Laboratory In both cases the work involves research and development in the realm of semi-conductors, solid state physics and photo devices

(a) SENIOR PHYSICISTS to act as Group Leaders with several years of academic or industrial research experience, preferably but not necessarily, in the above fields

(b) PHYSICISTS with honours degrees, to work in research and development teams—with or without previous experience

In both cases, the positions offered are progressive and pensionable, and carry attractive salaries Candidates, free of national service obligations, should apply, quoting reference V P L (J),
to Mr G A Taylor,
Personnel Manager,
Mullard Research Laboratories,
Cross Oak Lane,
Salfords, near Redhill, Surrey

RESEARCH ENGINEERS HONOURS graduates preferably with some postgraduate or industrial research experience capable of planning and controlling research work on a wide range of mechanical engineering problems including materials structures, mechanisms and heat transfer Wide scope and good prospects for men with initiative Age 25 to 30 approximately —Applicants should write to Manager, Research Department, Metropolitan-Vickers Electrical Co Ltd, Trafford Park Manchester 17 giving a statement of their age qualifications and experience and suitable references

---

DENIS FERRANTI METERS LIMITED Bangor North Wales Attractive vacancies occur in company situated in North Wales coastal town for engineers and physicists to work on interesting development projects Experience on optical devices, electro-magnetic equipment or electronic instrumentation, and degree or higher national certificate desirable A vacancy also exists for an industrial statistician to plan experiments and interpret data obtained in research work Assistance may be given in obtaining accommodation Good prospects in rapidly expanding organization —Applications in confidence to Chief Engineer

THE EDISON SWAN ELECTRIC CO, Ltd, Cosmos Works, Brimsdown, Enfield, Middlesex, has vacancies in its Research and Development Laboratories for

1 Circuit Development and Application Engineers for colour television investigations

2 Circuit Development and Application Engineers for black and white television development work

3 Engineers for development work on television and F M amplifier problems Previous experience in V H F or F M required

4 Cathode Ray Tube Development Engineers for development work on colour and black and white tubes Previous experience on cathode ray tube development or design required

[illegible]plication Engineers for work in connection with customer problems on television, radio and F M

6 Engineer for design of test equipment for colour, black and white television and allied development work

7 Engineers for circuit development and application work on transistors

The above applicants should have a good engineering or physics degree or equivalent, but vacancies also exist for candidates with H N C or equivalent qualifications

The vacancies are a result of a large expansion in the Company's activities

Good salaries will be paid to suitable applicants, and the positions are progressive and carry the advantages of a pension scheme

The starting salary will depend on the qualifications, experience and age of the applicants

Applications in writing, which will be treated with the strictest confidence, should be sent to the Personnel Superintendent

RESEARCH PHYSICIST

The British Jute Trade Research Association has a vacancy for a Physicist to assist in research into the fundamental principles underlying the processing of textile fibres into yarns the work primarily involves classical physics, and applicants should possess a good honours degree The commencing salary will be fixed in accordance with the qualifications and experience of the person selected and F S S U provision will be available

Write, giving full details to the Secretary, The British Jute Trade Research Association, Kinnoull Road, Kingsway West, Dundee

---

ASSISTANT WITH TECHNICAL QUALIFications required by Metropolitan-Vickers Electrical Co Ltd, Trafford Park, Manchester, 17, to train as Industrial Information Officer Experience of this type of work is not essential Salary will depend on qualifications and experience and will be progressive —Write, giving full particulars, including age sex, nationality education and experience to Personnel Manager marking envelope "H 2"

ABSTRACTOR REQUIRED FOR ENGINeering and physics subjects by Metropolitan-Vickers Electrical Co Ltd Trafford Park, Manchester 17 Progressive opportunities for one who has ability for concise expression, is interested in new developments and in writing up technical matter Engineering experience would be an advantage initially, but experience in abstracting not essential —Apply, in writing to Personnel Manager giving details of technical qualifications, experience if any and present salary Mark envelope "F 1"

MATHEMATICIAN (GRADUATE) IS REquired for the solution of problems arising in new applications of diesel engine injection equipment The work involves the use and refinement of a digital computer programme Industrial mathematical experience is desirable National Service must be over Salary according to qualifications and experience Pension scheme —Apply in writing to the Personnel Manager Ref R 16, C A V Limited, Warple Way, Acton W 3

COMPANY ON SURREY BORDERS OF London engaged in packaging industry require Research Engineer Physicist preferably but chemical experience useful Knowledge of paper converting would be advantageous but not essential —Apply in writing to Box N 832 c/o 191, Gresham House, E C 2

UNICAM INSTRUMENTS, LTD

Applications are invited from electronic engineers for positions in the development and inspection departments of Unicam Instruments of Cambridge This company is engaged in the manufacture of important instruments, combining original optical and electronic design, which are much in demand for academic and industrial research and process control the world over Good salaries according to qualifications will be paid —Applicants should send full details of age, education and experience, to the Personnel Manager, Unicam Instruments Ltd, Arbury Works, Cambridge

MECHANICAL AND CHEMICAL ENGINEERS

Courtaulds, Limited Chemicals Division, requires two graduate Mechanical Engineers and one Chemical Engineer for investigational and development work near Manchester The work is of an original nature in connexion with the development of chemical plants and processes for which a real interest in and potential talent for engineering development work as applied to large-scale chemical plant is of paramount importance The Mechanical Engineers must have served an apprenticeship for at least two years, and all candidates must have had practical works experience Honours degree men preferred Age 25 to 35

Candidates should write for a detailed form of application to the Director of Personnel Courtaulds, Limited, 16 St Martin's-le-Grand, London, E C 1, quoting the reference number H8 for Mechanical Engineers and H 9 for the Chemical Engineer

---

CHIEF CHEMIST REQUIRED BY FIRM specializing in the rare metals to supervise both routine and research laboratories Ph D or equivalent degree with some industrial experience Commencing salary £1,500 per annum Contributory pension scheme —Box 636 T G Scott and Son, Ltd, 143-147 Regent Street, London W 1

RESEARCH LABORATORIES OF A MAJOR oil company have a vacancy for a first-class electronics engineer The position, which is a new one, involves the establishment of maintenance procedures for modern analytical instruments and the design and application of control instruments for pilot plant, test engines and analytical work Applications for this position are invited from first- or upper second-class honours graduates in physics, chemical or electrical engineering who have had a minimum of five years' experience in the application of electronics to industrial and/or laboratory instrumentation The salary offered will to some extent be dependent on the qualifications of the successful candidate, but it will be at a level commensurate with the responsibilities of the job The position is permanent and pensionable —Write in first instance to Box 643 T G Scott and Son, Ltd, 143-147 Regent Street London, W 1, giving brief details of education and experience

---

GRADUATE CHEMIST, METALLURGIST or Chemical Engineer required, to deal with problems relating to the installation of electroplating plant and process control Applicants must have completed military service and be willing to travel —Apply Electro-Chemical Engineering Co, Ltd, 161 Queens Road, Weybridge Surrey

---

CHEMISTS AND PHYSICISTS REQUIRED for the preparation and evaluation of luminescent materials for use in a new project Men of graduate standing with relevant experience are needed Salary in accordance with qualifications Location near Northampton —Box 641, T G Scott and Son Ltd 143-147 Regent Street, London W 1

JUNIOR TECHNICAL ASSISTANT REquired by London Chartered Patent Agents with a view to training for qualifying as a patent agent Degree standard in electrical or mechanical engineering —Write, giving details of age, experience etc, to Box No 5952 c/o White's Ltd, 72/78, Fleet Street, E C 4

IMPERIAL CHEMICAL INDUSTRIES, LTD, Lime Division has vacancies for Research Chemists (age range 26-35) Candidates should have a Ph D, M Sc, or at least an honours degree in physical and inorganic chemistry —Apply giving full particulars to the Division Staff Officer, Royal Exchange Buxton

---

LADY CHEMIST, GRADUATE OR H N C required for analysis of electroplating and allied solutions —Apply, Electro-Chemical Engineering Co, Ltd, 161 Queens Road Weybridge Surrey

COTTAGE LABORATORIES LIMITED

have a number of vacancies for scientific and engineering appointments at both senior and junior levels, to undertake interesting and original development work Applicants should possess experience in at least one of the following subjects

Light Mechanical Engineering
Electromechanical Servo Systems
Electronic Circuit Design

and for some of the posts a knowledge of physics would be an advantage Candidates for the senior grades will, in addition, be expected to hold adequate qualifications in the appropriate subjects The appointments will carry salaries commensurate with the duties and responsibilities involved, and are pensionable after one year's satisfactory service

Excellent opportunities for progressive positions in an expanding organization are available to those with real ability and initiative

Five-day week, with good holidays and sick pay The laboratories are fully provided with modern equipment and are situated in pleasant country surroundings on the main Portsmouth Road with good public transport services from Guildford and Kingston passing the premises

First-class canteen, sports club and recreational facilities

All applications should be addressed to the Technical Manager at Portsmouth Road Cobham, Surrey, giving full details o qualifications, previous experience anc salary required, and will be dealt with ji strictest confidence

---

THE BRITISH PETROLEUM COMPA
have vacancies in their Production Research
Development Establishment at Kirklington
in the Nottingham area, for Honours Gradu
trained in physics and/or chemistry, and pre
ably, but not essentially, with two or three ye
experience in industry The work is concer
with problems which arise in the exploitation
oil reservoirs The properties of reservoir ro
including pore, surface and electrical cha
teristics and of the fluids they contain, are stu
to determine the factors which influence flow
oil gas and water underground, this infor
tion is applied in studying the behaviour
individual producing fields with special refere
to recovery efficiency Supporting investigat
cover borehole surveying comprising the la
forms of electrical and radioactivity loggi
modern high pressure techniques are used in
serving the phase behaviour of the fluids u
reservoir conditions Interpretation of ex
mental and field data calls for some mathema
ability Opportunities arise for staff to follow
investigations in the field, consequently ca
dates should be prepared to work abroad as
when the need arises Age under 30 ye
Good pension scheme Salary according to
and experience —Write, stating age and full
tails of qualifications, quoting H 3129, to

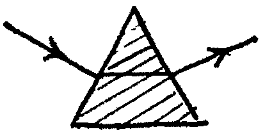
BUILDING BLOCKS

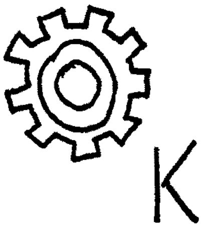


If you have a problem in radiation measurement, there is a Building Block combination to help you Building Blocks are unitized components, covering a wide spectral range, that can be assembled into an infinite number of combinations, each designed to meet particular problems.

For example, with standard Perkin-Elmer parts it is possible to construct universal spectrometers covering the visible, ultra-violet and infrared regions; micro-spectrophotometers, high resolution grating spectrometers, Rapid Scan Monochromators, Raman, and many other instruments utilizing monochromatic radiation

Write us your problem in radiation measurements—or choose your building blocks from the list below.

The Perkin-Elmer Corporation, 890 Main Avenue, Norwalk, Conn.



Standard Building Blocks

Sources

Hydrogen lamp (2100 Å—3600 Å) and Power Supply
Tungsten Ribbon Filament (0 350 micron—2 7 microns) and Power Supply
Globar (1 micron—40 microns) and Power Supply

Source Focusing Assemblies

Single Beam Globar Source Assembly
Multiple Source Assembly
General purpose source assembly
Direct ratio twin beam source assembly

Monochromators (Prism or Grating)

Model 99 double pass
Model 83 single pass

Detectors

Photomultiplier Tube (2100 Å—7000 Å)
Lead Sulfide Cell (0 4 micron—2 7 microns)
High speed thermocouple (1 micron—40 microns)

Detector and Exit Optics

External PbS and Thermocouple Mount
External Photomultiplier Mount
Internal Photomultiplier Mount
Cassegrain Condensing System
General purpose exit optics assembly

Amplifiers

Thermocouple Preamplifier
Photocell Preamplifier
Model 81-A 13 cps Amplifier
External 13 cps chopper and rectifier assembly

Automatic Operation

Wavelength drive and control system
Electronic Servo Slit programming system
String slit drive

Miscellaneous Accessories

Infrared Polarizer and Rotable Cell Mount
Specular Reflectance Attachment
Infrared Microscope Attachment

Mirrors and Mounts

Standard Spectrometers Mirrors and Mounts
Off axis paraboloids (14°, 18° and 21°)

Special Sampling Accessories

Adjustable long path gas cell (10 meters)
Horizontal cell mount with heated stage and power supply
High pressure cells
Evacuable KBr pellet die
Microcells

PHASE CONTRAST OUTFITS

- For excellent performance at modest cost
- Fit Baker or other microscopes made to accepted standards
- Available in powers × 10, × 40, × 100
- Outfits from £28 10s
- Complete instruments from £62 4s

THE NEW B.T.L. VAN SLYKE GAS ANALYSIS APPARATUS

The Van Slyke Standard Manometric gas analysis apparatus has been completely redesigned to conform to modern practice and the following features are of particular interest

- Glass water jacket is illuminated to give a clear view of the shaking pipette
- Manometer fitted with illuminated meniscus-reader for accurate readings
- Easy adjustment of manometer and connecting tubes
- Totally enclosed motor and drive mechanism
- Rotary rheostat for control of shaking speed from a maximum of 200 per minute
- Timer and alarm buzzer can be fitted as an extra

Price £60 or with timer £70. Immediate Delivery. Full details will be sent on request

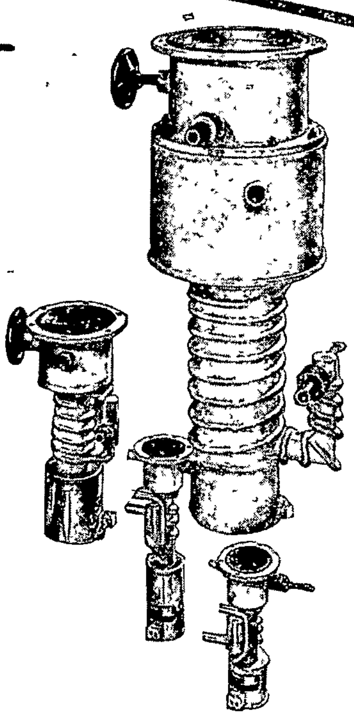
The WHEN? and WHY? of MERCURY VAPOUR PUMPS



These examples are but a few of the many specific applications of mercury vapour pumps which we manufacture to meet every research and industrial requirement—complete, if necessary, with valves, traps, backing pumps and lines and all accessories.

A new addition to our range is the MODEL 2M4, a very high backing pressure pump which can be isolated from the backing line for very long periods without loss of pumping speed.

ULTIMATE VACUUM: 10^{-6} mm.Hg.

When?	*Why?*
PUMPING AGAINST VERY HIGH BACKING PRESSURES	Achieves very high boiler pressures without fluid decomposition.
GAS "SAMPLING"	No decomposition products of the fluid to mingle with sample gas
MAKING RHODIUM MIRRORS BY VACUUM EVAPORATION	This metal is extremely sensitive to oil vapour which causes discolouring
EVACUATING SYSTEMS CONTAINING PHOTO-SENSITIVE OR SECONDARY-EMISSION SURFACES	The mercury pump combined with the liquid air trap keeps system entirely free from contaminants
EVACUATING MERCURY ARC, MERCURY VAPOUR LAMPS, ETC.	Mercury is already in system. No liquid air trap is necessary.
PUMPING CHEMICAL GASES AND VAPOURS	Many chemical gases will attack organic fluids.
PRODUCTION PUMPING OF MINIATURE RECEIVER VALVES	Ability to withstand rough usage on ultra-quick production cycles

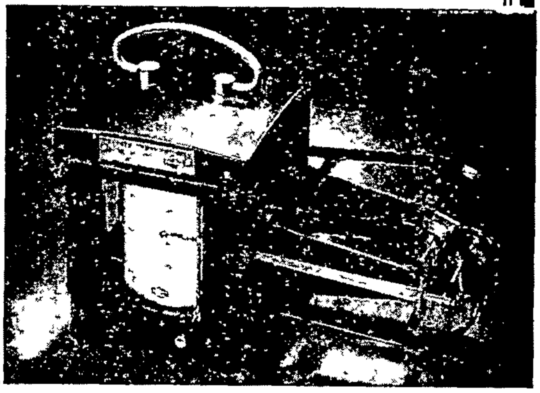
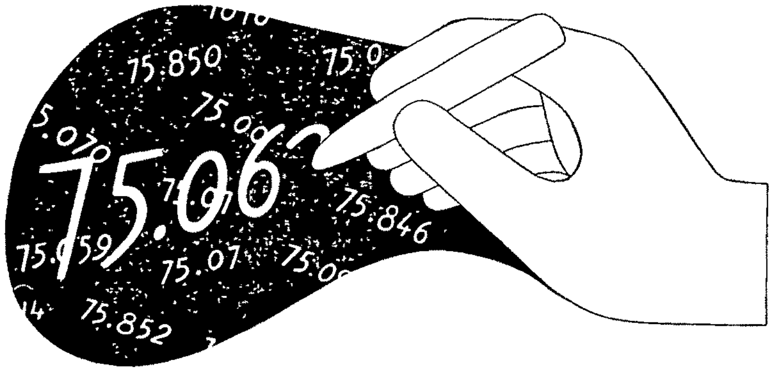
The Thermograph



"The mean for these experiments gives 75 07 We therefore consider 75 as the true number indicated by these experiments for the atomic weight of carbon It is remarkable that this number was fixed upon theoretically by the English chemists and has now been confirmed by experiments"



... confirmed by the experts

DR MARCHAND OF BERLIN made this statement in a letter recorded in the first volume of the Proceedings of the Chemical Society (1841), challenging the claim of Liebig and Redtenbacher to have established 75 854 as the correct atomic weight for carbon. In those days atomic weights were related to oxygen as 100, and it is notable that the 1951 atomic weight for carbon calculated on this basis is 75 063 compared with Marchand's figure of 75 07 derived from the combustion of diamond and graphite

Dr Marchand, whose methods were simple and direct, would have welcomed the convenience and accuracy of 'AnalaR' reagents It is even possible that they would have assisted the highly elaborate analytical work of Liebig and Redtenbacher to a more successful result

SCALAMP FLUXMETER

Excellent design and the selection of the most suitable materials are combined to give this new FLUXMETER a truly outstanding performance. The drift rate with a search coil of 10 ohms or less is 0.1 per cent. A two speed "return-to-zero" control is fitted enabling measurements to be made with rapidity and ease. A spirit level and levelling feet facilitate setting-up and the automatic and manual coil clamps safeguard the suspension in transit. The illumination of the lamp bulb is effected either by an external 4-volt battery or by mains supply through the built-in transformer. Two search coils of mean diameter 1 cm and of area turns of 10 or 100 cm.^{2} are available.

Special purpose Cathode Ray Tubes
for Research and Industry

A range of cathode ray tubes is available for use in specialised applications such as the observation and recording of high speed transient phenomena, where the high capacitances and other limitations of the usual type of instrument tube would result in distortion or complete suppression of the trace

Typical applications of these special tubes include high voltage cable testing insulator overload and breakdown testing, cable fault finding by quasi-radar technique and the investigation of high voltage switching phenomena

They are also suitable for use in laboratory oscilloscopes

Brief details of some of the more popular types are given below The tubes are of the all-electrostatic type, with heater ratings of 4V, 1 0A (approx)

401 CAHA
408 CAHA
Rating
Va3 (max) 1 5kV
Vp d a 3 3 5kV
Sx (av) 0 090mm/V
Sy (av) 0 100mm/V
Screen 401 CAHA Green-visual
408 CAHA. Killed blue—photographic
Base B9G (pressed glass)

4cm dia high vacuum monitor tubes with one stage of post deflection acceleration For use in laboratory oscilloscopes, multi-channel strain-gauge recording equipment, etc.

908 BCC
Rating
Va3 (max) 10kV
Sx (av) 400/Va3 mm/V
Sy (av) 750/Va3 mm/V
Screen Killed blue—photographic
Base B12D

A 9cm dia flat screen high speed recording tube with a low capacitance deflecting system The connections to the plates and final anode are brought out through side-arms Writing speeds of the order of 30,000 km/sec are possible, and transients of the order of 10^{-9} sec may be recorded

908 CARA
Va3 4kV
Vp d a 8kV
Sx (av) 0 085 mm/V
Sy (av) 0 12 mm/V
Screen Killed blue—photographic
Base B12D

A 9 cm dia flat screen high speed recording tube with one stage of post deflection acceleration For use where the special features of the 908 BCC cannot be employed to full advantage The Y plate connections and final anode are brought out through side arms

1601 ABC
Va3 (max) 5kV
Sx 660/Va3 mm/V
Sy 1100/Va3 mm/V
Screen Green—visual
Base B12D

A 16cm dia flat screen high speed oscillograph tube The construction is of the low capacitance type with the deflector plates and final anode connections brought out through side arms

1608 BCCA
Va3 (max) 3 5kV
Vp d a 3 (max) 10kV
Sx (av) 0 15mm/V
Sy (av) 0 27mm/V
Screen Killed blue—photographic
Base B12D

A 16cm dia flat screen tube of similar low capacitance construction as the 908 BCC, but with three stages of post deflection acceleration This tube will achieve similar writing speeds and recording periods as the 908 BCC, and is recommended for use where the deflecting potentials available are limited

Alternative screens are available including long after-glow and white and blue aluminised types

Other types of special tubes are available including
Double gun tubes Storage tubes
Television monitor tubes
Conical deflection systems tubes for radial time bases Monoscopes, etc

45% greater capacity

cuts filing costs . . .

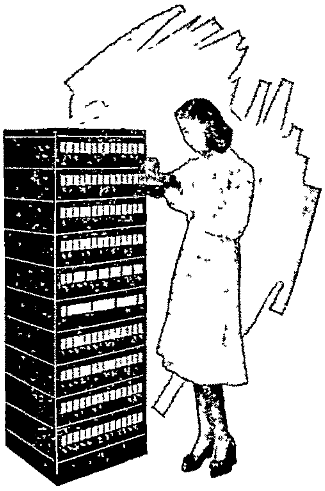
saves floor space

Single "LAB AID" section holding two 1" drawers, two 2" drawers (for wide slides, color transparencies, etc) and two 4" drawers (for lantern slides, cards, etc)

How can a Technicon "LAB-AID" filing cabinet measuring only 19" square by 5" high hold up to 6500 (average) one-inch microslides? The single section illustrated here with its drawers extended will show you why . . it's because there are no thick bulkheads between drawers — no space-consuming buttresses, no bulky tracking guides Yet, close-set as they are, every drawer slides straight and true . . easily, smoothly, without binding.

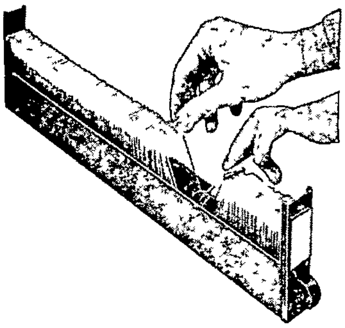
Drawers are freely interchangeable, too, thanks to the unique "LAB-AID" unit-gauge track system, so that you can intermix 1" drawers with 2" drawers (even 4" drawers, if you like) according to your needs

Staunch, fireproof "LAB-AID" units are strongly built of heavy gauge steel for a lifetime of satisfactory use Beautifully finished in olive green enamel, with combination drawer-pulls and label holders Separate bases and finishing cap panels make complete units of any number of sections your filing needs require, expandable at will at any future time.



A stack of ten sections, complete with base and cap panel Interlocking design lets you pile sections right up to the ceiling Staunch "LAB AID" construction easily bears the heavy weight of solidly packed slides

For filing current slides, the removable spring separator lets you riffle through them as easily as you flip the pages of a book . . easy to file, easy to find Slip it in when you need it, take it out when you use the drawer for storage filing



TECHNICON Lab-aid laboratory filing cabinets

Technicon "LAB-AID" filing cabinets have long been standard filing equipment in laboratories throughout the world Now made in France, they can be easily imported into the United Kingdom

Why SP 600?

COLORIMETER

ABSORPTIOMETER

SPECTROPHOTOMETER

In every way the SP 600 Spectrophotometer makes an ideal complement to the familiar SP 500 There are analytical problems (in the field of metallurgy, for example) which demand an instrument capable of precise absorption measurement at carefully selected wavelengths, but for which ultraviolet equipment is not necessary

The SP.600 is designed to provide exactly these facilities

The dispersion of the glass prism and the high quality optical system give a resolution unobtainable with filters and the electronic detector-amplifier makes the instrument exceptionally sensitive. It is robust, easily operated and moderately priced

Arrangements can be made for a comprehensive test in your own laboratory, without obligation Please write for details.

A service well worth remembering . . .

The Kodak service to scientists and technicians includes the provision of photographic plates made to special formulae.

This range of 'Kodak' Scientific Plates includes 84 selected combinations of 16 colour-sensitizing classes and 8 emulsion types differing in speed and contrast They are not normally stocked, but are supplied to special order—a service well worth remembering when no commercial plate seems to fit your requirements

Other 'Kodak' Scientific Plates cover specific laboratory requirements

'Kodak' Uniform-Gamma Plate

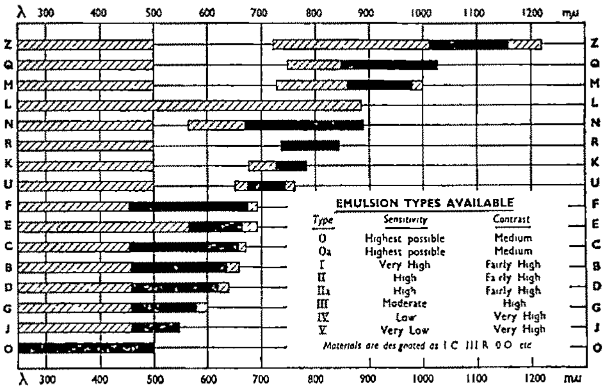
Used in ultra-violet spectrography to obtain a much more uniform contrast over the spectral range 250-400$m\mu$ Available to special order

'Kodak' M R. Maximum Resolution Plate

Has an almost grainless emulsion and a very thin emulsion layer Specifically produced for very high resolution photography, for graticule production, and for X-ray micrography Stocked in ¼-plate and ½-plate sizes

'Kodak' Autoradiographic Plate

Used for tracing small amounts of radioactive substances, and to study 'tagged' atoms within the macrostructure of animal or plant tissues Stocked in ½-plate size



EMULSION TYPES AVAILABLE

Type	Sensitivity	Contrast
O	Highest possible	Medium
Oa	Highest possible	Medium
I	Very High	Fairly High
II	High	Fairly High
IIa	High	Fairly High
III	Moderate	High
IV	Low	Very High
V	Very Low	Very High

Materials are designated as I C III R O O etc

The chart shows the wavelength to which each of the 16 *colour-sensitizing classes of 'Kodak' Scientific Plates is sensitive, and the region of special sensitivity*

Instruments for Research and industry

Direct Reading pH Meter

A robust and exceptionally stable mains-driven instrument which is being widely used by leading firms, both at home and abroad. The 6-inch mirror scale meter may be read to 0.05 pH, and the normal zero stability of the instrument is ± 0.02 pH. There are two pH scales: one reading 0–14 pH and the other giving a coverage of 7 pH over any part of the scale. A millivolt scale is also included and automatic temperature compensation is provided from 0° to 60° C.
A complete range of laboratory and industrial electrode systems is available for use with this instrument.

RICHMOND : SURREY : ENGLAND

POTENTIAL SCIENTISTS AND TECHNICIANS IN THE SCHOOLS

IN its fifth annual report nearly three years ago the Advisory Council on Scientific Policy noted that prejudice against an industrial career and lack of knowledge of its opportunities on the part of both parents and teachers were responsible for robbing the nation of potential talent in science and technology. A recent investigation made by the Physics Department of the University of Bristol, and reported by Prof N. F Mott and N. Thompson in the *Universities Quarterly*, on those candidates for admission to the honours school of physics there who are not accepted, suggests that, of the boys with ability but no inclination to study science to be found in the arts sixth forms, some at least might have chosen to study science if they, their parents and their headmasters had been fully aware of the need of the community for well-educated scientists and the opportunities open to such men. The seriousness of such ignorance has, however, usually been emphasized more particularly in respect of the shortage of scientists than in regard to scientific and technical man-power generally. The Parliamentary and Scientific Committee, it is true, in its memorandum on Higher Technological Education issued last July, commented on the importance of creating a bigger demand from the school population of Britain for education in science and technology, and in opening a debate on this memorandum in the House of Lords on December 7, Lord Glyn affirmed that many promising pupils in the secondary schools are discouraged from technological studies Lord Salisbury stated in that debate that about two-thirds of the boys in the sixth forms of grammar schools as a whole are taking science as their main subject of study, and that, of the eight thousand State scholars n the country, some five thousand are studying science, but he agreed that all possible steps should be taken to attract a good proportion of the ablest boys and girls to a scientific career

Nevertheless, a committee on the Shortage of Science Teachers, set up by resolution of a conference convened by the Federation of British Industries n January 1954, reported that probably the most mportant untapped source of potential science graduates is to be found among the able pupils who eave the grammar schools at sixteen. That committee expressed the hope that the schools, with the ull support of the local education authorities, would ucceed in convincing these boys and girls and their parents of the value of the sixth-form course and hus prevent this waste of ability. Since then, a eport published by the universities committee of the Association of Scientific Workers, based on a questionnaire sent to 303 secondary grammar schools, direct-grant schools, and independent schools, has suggested hat an increase of at least twenty per cent, and even up to fifty per cent, in the number of suitable science students at the universities is possible if all suitable grammar school boys and girls could be persuaded to complete a sixth-form course At present, twenty-one per cent of those who left local education authority schools and fifteen per cent of those who left independent and direct-grant schools would, in the opinion of their teachers, have benefited from the sixth-form course, while thirty-two per cent of those in science sixth forms in local education authority schools and twenty-three per cent in direct-grant and independent schools left to take up jobs when, in the opinion of their teachers, they should have proceeded to universities.

This estimate has now been endorsed by the broader and more systematic study of premature school-leaving in England undertaken for the Minister of Education towards the end of 1952 by the Central Advisory Council for Education (England) (see also p. 331) The inquiry was to consider what factors influenced the age at which boys and girls leave secondary schools which provide courses beyond the minimum school-leaving age in Britain (at present fifteen), the extent to which it is desirable to increase the proportion of those who remain at school, particularly the proportion of those who remain at school to the age of about eighteen, and the steps to be taken to secure such an increase. Broadly speaking, the report of this inquiry[*], which is based on a ten per cent sample of maintained and direct-grant grammar schools in England, fully establishes that while the practice of early leaving is declining, there is still an important leakage of potential scientists Of the grammar school intake of 1946, in addition to about 10,000 boys and 7,000 girls who took advanced sixth-form courses, there were in addition about 5,000 boys and 5,000 girls with the capacity to do so if they had stayed longer at school, and of those some 2,900 boys and 1,300 girls would have been suited for courses in mathematics and science. If all these boys and girls had completed advanced courses, the number of boys taking sixth-form courses would have been increased by about half, and the number of girls by about two-thirds

Nevertheless, the value of the report lies not so much in its demonstration of a loss of at least 4,000 potential scientists or technologists—including science teachers—as in its clear presentation of the factors that require consideration in determining either immediate action or long-term policy. The Council's estimate that less than half the present intake into grammar schools could profitably take sixth-form courses is a reminder of the need both for action to prevent waste of public expenditure and for caution in deciding on the measures by which the leakage of talent is to be checked.

---

[*] Ministry of Education Early Leaving a Report of the Central Advisory Council for Education (England) Pp. vii+99 (London: H M Stationery Office, 1954) 3s 6d net

The Council's attitude to the extension of the school life beyond sixteen is thoroughly realistic It rejects as inadequate by itself both the approach which asks whether continued education will assist a child to develop more fully as an individual, and also that based on whether it will fit him or her for the work he or she may be called upon to do later in life "A child," it says, "must grow up into the community and adjust himself to its economic demands and moral obligations , and it is wrong to create the illusion in the child's mind that he has the right to demand from it the kind of life that pleases him or will give him the greatest scope for self-expression regardless of the needs of others " That was worth saying to-day. But the report continues "a citizen's economic role is not his whole life . . . no economic system will ever be so organized that everyone will use his whole talents in his employment . . . education must not confine itself to cultivating those abilities which may be economically useful but should be given in good measure to develop the whole man".

The Council, accordingly, suggests that academic ability should be the first determining factor. If the interest of a pupil flags as the work of the school in the upper forms calls for increased power of abstract thought beyond his or her capacity, the school should not try to persuade the pupil to stay. Nor should it seek to retain those in whom school life produces a real and continuous sense of frustration.

The Council thus recognizes that there are some boys and girls who, because of their intellectual or emotional characteristics, should leave school before they are eighteen these may well be the school leavers which industry, as the Federation of British Industries has recently pointed out, should be seeking more actively to recruit While satisfied that there is enough academic ability to justify an increase in the number of boys and girls following advanced courses by about a half and two-thirds, respectively, the Council is dubious as to the wisdom of enforcing generally a leaving-age of sixteen or even a statutory differential leaving-age for grammar schools. The significant reduction in early leaving manifest in recent years does indeed suggest that ultimately, as the educational changes of recent years have their full effect in the homes, some of the factors which at present encourage early leaving will lose force. Nevertheless, the Council is not content to rely on such long-term tendencies, and if only as a contribution towards meeting the present national need for scientists and technologists, its proposals, though somewhat tentative, should receive vigorous support.

Those proposals are already being considered by Sir David Eccles, as he indicates in his foreword, and the reservations he obviously has are rather on the financial side. Sir David takes the reasonable view that the main purpose of any increased maintenance allowances, such as the report recommends, should be to help the right pupils to stay at school—to give help where there is both need and merit. Whether an all-round increase in the proportion of grammar school places is desirable is less certain, and the Council makes some comments on the importance of developing courses both in modern schools and in technical colleges and other institutions as alternatives to sixth-form work , the implications of these proposals require fuller examination than they are given in this report

The report is, as so often happens, stronger in diagnosis than in the prescription of remedies for what is wrong It suggests, for example, that more opportunities for transfer from modern schools to grammar schools are required, but without examining in any detail the difficulties involved, or discussing the reverse process It has little to say about the ways in which the parental attitudes could be changed, although unfavourable home influence is a decisive factor here, as it is also the main cause of the waste of talent through early leaving.

On that point the report provides clear evidence, though the reasons why the middle classes make the best use of educational opportunity are by no means equally clear , the report itself suggests that more precise study of home backgrounds in relation to education is much needed, particularly of the effect of the home background of the semi-skilled and unskilled worker upon a child's education at a grammar school. Children from professional and managerial families account for 15 per cent of the school population, but for 25 per cent of that of the grammar schools and for 43 7 per cent of the sixth forms. Not only is the performance of such children in the selection tests at eleven better, but also they stay at school longer and they do better at the grammar schools. "From the children of parents in professional or managerial occupations at one extreme to the children of unskilled workers at the other, there is a steady and marked decline in performance at the grammar school, in the length of school life, and in academic performance at the time of leaving. This is not a mere development of the better performance at the age of eleven of children in certain groups , it reflects a widespread changing of places in academic order between eleven and sixteen or eighteen."

As a corollary it follows that the risk of waste of public money in fees and maintenance allowances increases as performance declines in this way. This is no argument for reserving a proportion of grammar school places for those whose parents are willing to pay fees—a suggestion firmly rejected by the Council —though it suggests that it is wise to take account of the fact that there are some boys and girls whose outlook and lives are dominated by the traditions of their family, and by friends favouring early earning and independence and opposed to a long school life The Council wisely observes that care should be taken not to handicap further the children of unskilled workers who are most subject to such influences This influence and outlook are bound to be affected by changes in the education which the parents themselves have received. "The effect on the grammar schools of the changes introduced in 1944 will not be properly seen until the boys and girls affected by them in their school days themselves have children of secondary school age "

Apart from this, the report also makes clear that shortage of money is in itself a less common reason for leaving than some others Financial considerations, however, affect the decision to leave for an appreciable number of children, especially among those of semi-skilled and unskilled workers, and for this reason the Council concludes that the existing schemes of aid are not fulfilling their function and that there is a clear case for improvement, either by increasing the rates of grant or extending the parents' ncome-range, or both. The Council did not examine the financial implications of its proposal, nor has it fully explored the social or political implications, though the complexity of the problem is clearly ndicated

Perhaps understandably enough, the Council was reluctant to grapple with the implications of this forthright demonstration that, in education and in ife, heredity and environment do, after all, matter a great deal It was not expected of the Council that t should express an opinion as to whether it is more n the public interest to remove all handicaps to the development of every outstanding intellect or to make sure that every mediocre intellect has a chance It has at least suggested some practical steps for making the dilemma less acute, but none the less, n doing so, it might have been expected to face more fully the minor dilemma which arises when it considers the immediate action required to stop the eakage of potential scientists

There can be no doubt that it would be worth aking all possible steps to obtain even half the additional scientists which the report suggests are being lost each year. The report gives no indication as to how this should be done, though it would seem hat the most obvious measures are those already uggested by the Advisory Council on Scientific Policy, and which for a different purpose the Federaion of British Industries has already begun to apply —publicity and persuasion Even here the implications seem to merit a little closer examination The report points out that if we succeed in inducing more boys and girls to stay on in the sixth forms, whether the science sixth or not, they will, *ipso facto*, be diverted from other careers, and such vidence as this inquiry has yielded suggests that most of them will be diverted from some sort f clerical career, apprenticeship or laboratory work.

For the first two groups the maximum numbers would be no more than about one-seventh or oneighth, even if all the qualified boys and girls were diverted to more advanced forms of training, and he Council admits that it is desirable that some such boys and girls, if not the most intelligent, should ollow these types of career There are other bodies, uch as trade unions, besides industrial firms, which hould welcome this source of recruitment of potential eadership The loss among laboratory technicians is more serious, not simply because quantitatively it may amount to some thirty-six per cent, but also because of its bearing on the efficient use of existing scientists and technologists This aspect is dismissed too cavalierly by the Council. It may be wasteful to employ as technicians boys and girls capable of qualifying as first-class scientists and technologists, but it is equally wasteful to employ a trained scientist or technologist on duties which could be carried out equally well, and perhaps better, by a less highly trained technician The Council, in fact, scarcely seems to appreciate the extent to which the work of the laboratory technician demands skill and intelligence, or the imperative need at the present time of making the utmost use of the services of technicians to relieve the existing shortage of scientists and technologists

That has been repeatedly emphasized in recent discussions on the shortage of science teachers in particular, for example, by Dr Eric James at the conference of the Universities of Great Britain and Northern Ireland last December, when he asked whether industry is using its scientists efficiently, and it has always been recognized in discussions on the expansion of higher technological education that many more technicians than technologists and scientists will always be required More harm than good may well be done if attempts to persuade boys to stay on in the science sixth to take up a career as scientist or technologist, following a course at a university or a college of technology, convey the impression that that of technician is of low esteem or in any way less important It is at least for consideration that for some boys and girls a period in the science sixth may be the most appropriate prelude to a career as a laboratory technician, and the Council suggests generally that professional bodies and employers could alter their conditions of entry to encourage staying at school until eighteen

Any approach to parents or to teachers suggesting a national need for a particular kind of talent is open to the implication that other careers, though less exacting intellectually, are inferior in either importance or esteem Such an approach may well be the most promising immediate step, but it should be supported by those auxiliary means of helping the child handicapped by home conditions, such as providing opportunities for evening study in the public libraries or schools, which the Council suggests In such matters the Minister of Education's influence could be decisive, and it is to be hoped that controversy over the more dubious financial proposals will not distract attention from such immediate ameliorative measures Ultimately, as the report makes plain, the solution lies with public opinion, within and without the home, and one step which scientists and technologists themselves could take is to press for some reasonable and authoritative estimate of the nation's requirements for technicians in relation to the need for scientists and technologists Such an estimate, based on a realistic conception of the efficient use of trained man-power, is an essential basis for any publicity on a national scale, or approach either to parents or teachers, in terms of the national need for such talents

HENRY EDWARD ARMSTRONG

Henry Edward Armstrong

Educational Work By Charles E Browne. Pp xiii+26+4 plates (London Christ's Hospital, 26 Great Tower Street, E C 3, 1954) 6*s*.

THE title of this book is too comprehensive for the restricted scope of its contents A volume so slender can tell us little about its subject and less about his extensive educational work 'H. E A.', a man of remarkable personality, great vitality and vigour of mind, a prophet and a visionary, besides being a deep and versatile scholar of critical outlook and independence of thought, was a prolific writer and forceful speaker and had a rare gift of expression Conscious of a mission and burning with the fiery zeal of reform, he marshalled his great gifts and directed his efforts towards improving science teaching in the schools of Britain, and arousing and educating the public to a realization of the ever-increasing influence of science in human affairs

A fearless advocate of the causes he had at heart, he was an indefatigable educator and reformer. His weapon was the strength of his arguments, clearly and persistently put forward, his weakness, his use of biting wit and bitter comment. For he made little use of patient persuasion and delighted in stinging his audience. He admitted the unpleasantness of his methods, necessary, he maintained, to arouse people out of their apathy and indifference and make them think. Supineness and complacency, whether in a community or a person in authority, roused his wrath He was the stormy petrel of every committee on which he sat, the terror of editors of scientific journals, and the critic of everyone straying from the path of the scientific method

By his articles and letters to the Press, Armstrong attempted to educate the public on scientific matters He exhorted farmers to study the cultivation of sweet grass and repeatedly pointed out the health value of pure milk and wholesome bread. Ahead of his time, he urged that the scientific method should be applied to the exploitation of the Coal Measures of Britain. Again, he brought forward strong arguments for making a survey of the world's resources His edifying addresses to professional chemists—critical, hortatory and inspiring—are as pertinent to-day as when they were written Many pupils who owed their chemical education to him later became distinguished university professors. The booklet under review has of necessity little mention, not to speak of expansion, of the above educational activities

From the storm and turmoil of heated controversy, Armstrong seems to have found a psychological rest in his service to Christ's Hospital He was a governor of this old and richly endowed London school for more than forty years, and was influential in getting it removed to Horsham in Sussex There, amid ideal surroundings, with spacious well-equipped laboratories, very small classes and a specially selected staff, all due to his initiative and drive, he was able to get science taught in a way dear to his heart The boys were trained in the art and method of discovery, and learned only what could be argued from experiments carried out by themselves, a method of teaching later called 'heurism'. Most of the text and all the illustrations of the booklet are concerned with this phase of Armstrong's educational work. Sir William Hamilton Fyfe, headmaster in Armstrong's day, contributes the charming an laudatory prologue, in the epilogue, Dr G. va Praagh, the present senior science master, in summin up the "Heuristic Method To-day", has nothing t add to what is already known The author, the chie member of the science team collected by Armstrong pays a pious tribute to his old master, and is warml appreciative of the work he did for Christ's Hospita The book should delight the 'Old Blues' who cam under the influence of 'H E. A', and should help t keep fresh the memory of one who did his utmost t urge scientists to make ceaseless effort.

G. FOWLES

THE INTERACTION OF SCIENCE AND SOCIETY

Science in History

By Prof J D Bernal Pp. xxiv+967 (London C A Watts and Co, Ltd, 1954) 42*s*. net.

NEITHER of the two terms occurring in the titl of this volume must be taken in the strict sens tradition attributes to them, in which science mean natural science only and history is exclusively relate to the irrevocable past. Science here covers soci sciences as well, and the history that is told extend to the date of publication of the book

One need not read far to become aware of th motives prompting the author to take this broad an comprehensive view of his subject It was not hi intention to deal with history for history's sake, bu as a means of understanding the interaction of scienc and society, the importance of which is so con spicuous in these days and will surely become sti clearer in the future Accordingly, the historica approach plays the part of an introduction, and th author's aims would have been wholly thwarted i he had stopped short at the end of the nineteenth century, where as a rule works on the history o science have their time limit

There is another thing which is clear to the reade from the very beginning of the book, namely, tha the author considers the vicissitudes of science i the past and present from a deliberately Marxis point of view. He is convinced that not only th means used by scientists in their researches but als the guiding ideas of their theoretical approach ar conditioned by the events and pressures of society that scientific problems are set in the first place b actual economic necessity, and only in the secon place do they arise out of earlier scientific ideas, tha a new economic system inevitably involves a differen experimental science, that history has to be interpreted in terms of economics only and that consequently science in each period of its developmen has to be treated as a social and economic phenomenon

In my opinion, this way of looking at the histor of science means that an undoubtedly importan aspect of development, namely, the indisputabl relations between science and society, is unnecessarily made absolute, and raised to a status o uniqueness, with the neglect of numerous othe equally important influences Nevertheless, I mus acknowledge the excellent manner in which th author acquits himself of the task he undertook His mastery of the most diverse subjects in th history of science and in its present phase deserve the highest admiration. The way in which h expounds his views is perfectly clear As he avow his political ideas without any reserve, he is likely to hurt many a reader's feelings. This, however, should not be a reason for leaving the book unread. As the views developed are highly important and influential in these days, one will only harm oneself by not seizing the opportunity of seeing them defended in so masterly a fashion. As to the hurt, it will have to be taken into the bargain.

It would, of course, be quite out of place to direct the attention to some minor historical errors occurring in the work, the more so as they do not invalidate the theses sustained. E J DIJKSTERHUIS

HIGHER TRANSCENDENTAL FUNCTIONS

Higher Transcendental Functions

Based, in part, on notes left by the late Prof Harry Bateman, and compiled by the Staff of the Bateman Project. Vol 1. Pp. xxvi+302. 52s. Vol. 2. Pp. xvii+396. 60s. (London: McGraw-Hill Publishing Company, Ltd., 1953.)

THE rapid growth of mathematical knowledge and the multiplication of mathematical journals throughout the world make it increasingly difficult for the mathematician to keep abreast of his subject. For this reason the great project, first proposed by the late Prof. Harry Bateman, and so ably being carried out by Prof. A. Erdélyi and his colleagues, will earn the gratitude of great numbers of mathematicians, pure and applied. These two volumes, apparently to be followed by others, cover an extremely wide range. They contain thousands of formulæ, usually with some indication of origin, and frequently with suggestions as to methods of proof. At the end of each chapter is to be found a most useful list of relevant papers and books.

The first chapter deals with the gamma and beta functions, the second with the hypergeometric function. This is naturally followed by a chapter on the Legendre functions. It seems a pity that the authors did not take the opportunity, in this chapter and elsewhere, of giving a lead out of the morass of notations, so confusing to the student. For example, it is unfortunate that the notations $P_\nu^\mu(z)$, where $|z| > 1$, and $P_\nu^\mu(x)$, where $-1 < x < 1$, should refer to two different functions. After all, z can be replaced by $x(> 1)$ in the first function, and there is no reason why the argument of the second function should always be real. It is a simple matter to denote the second function by $T_\nu^\mu(z)$, as mentioned on page 179, and so avoid all ambiguity. It is high time also that Hobson's unfortunate notation for $Q_\nu^\mu(z)$, involving a factor $\exp i\mu\pi$, should be discarded. This factor was introduced to make the definition consistent with the definition when μ is a positive integer, namely,

$$Q_\nu^\mu(z) = (z^2 - 1)^{\frac{1}{2}\mu} \frac{d^\mu}{dz^\mu} Q_\nu(z).$$

In order to avoid the complex factor, Barnes replaced it by the factor $\sin(\mu + \nu)\pi/\sin(\nu\pi)$, thus ensuring that the function should be real for z real and greater than unity, but unfortunately making it vanish identically or become non-existent for certain values of μ and ν. The simplest thing to do is to insert a factor $(-1)^\mu$ on the right of the equation above, and then these troublesome factors are not required.

Again, it seems scarcely necessary nowadays to stress the Gegenbauer polynomials, as these can be expressed in terms of associated Legendre functions.

The fourth chapter deals with various types of generalized hypergeometric functions, and the fifth with E-functions, Meijer's G-functions and generalized hypergeometric functions of two variables. The E-functions have proved a powerful instrument in evaluating integrals involving Bessel, Legendre, confluent hypergeometric and other functions. The G-functions are generalizations of the E-functions, and their properties have been worked out with signal ability by Meijer. Their usefulness as an instrument of research has yet to be demonstrated. The final chapter of the first volume contains an account of the confluent hypergeometric function.

The second volume has chapters dealing with Bessel functions—naturally at considerable length—parabolic cylinder functions, incomplete gamma functions, orthogonal polynomials, spherical and hyperspherical harmonic polynomials, and orthogonal polynomials in several variables, and closes with a long account of elliptic integrals and functions. These should provide a valuable armoury for the research student. Here again something might have been done in the matter of notation. Nothing is gained by retaining the two Hankel functions $H_\nu^{(1)}(z)$ and $H_\nu^{(2)}(z)$ when one function only is required. Dougall's function $G_n(z)$ is simpler and more closely related to Macdonald's now generally accepted function $K_n(z)$. This latter function should be known as the modified Bessel function of the second kind—not of the third kind. One wonders, too, if the authors were unaware of the origin of the very general formula for the product of two Bessel functions at the top of page 48. It first appeared in the *Proceedings of the Edinburgh Mathematical Society*, Series 2, Vol. 2.

In spite of these criticisms, we congratulate the compilers on a great achievement. No university or scientific library will be complete without having these volumes on its shelves. THOMAS M MACROBERT

THE 'CHEMISTRY' OF ATOMIC NUCLEI

Nuclear Species

By Prof H E Huntley. Pp. xix+193. (London: Macmillan and Co., Ltd.; New York: St. Martin's Press, Inc., 1954.) 21s. net.

PROF. H. E. HUNTLEY has written an attractive elementary account of what may be called 'nuclear chemistry'. Just as the atomic shell model did for chemistry, the nuclear shell model is beginning to explain the more obvious facts of his subject. The author seems to think that a nuclear physicist should know his nuclei just as an inorganic chemist must know the properties of the elements, and of course there is everything to be said for this. But the subject is a wide one, namely, that covered by what is usually known as 'nuclear physics', while the book is mainly concerned with properties of the stable nuclei. It is true that there are references to radioactive nuclei, but many of their properties (for example, the characteristic features of β-emission) are not included. Since also the treatment of excited states of nuclei is rather sketchy, the subject-matter is largely confined to stable nuclei in their ground states. This subject is handled in a comprehensive and clear manner.

But Prof Huntley, in his preface, says that the book "is primarily intended for aspirants to University Honours". Personally, I do not think it would be practicable to introduce his subject-matter in so much detail into a crowded university honours course, because, after all, it is only a part of nuclear physics However, I would encourage any undergraduate or postgraduate student to read the book as part of his all-round education From this point of view it is perhaps a pity that the author has loaded the book with descriptions of more or less elementary background material (even, surprisingly, of the Michelson–Morley experiment) Such matters are not adequately dealt with from a student textbook point of view and might well have been taken as read In place, though the author's charts of isotopes are excellent, I would have liked to see the inclusion of a table of all the known nuclei (stable and unstable) such as the Seaborg–Perlman table of isotopes.

In spite of such criticisms, I am sure that Prof Huntley's book should be on the shelves of all physics libraries, since it undoubtedly contains a great deal of interesting material not available elsewhere in concise form H W. B Skinner

SHRUNKEN HEADS

Amazon Head-Hunters

By Lewis Cotlow. Pp. 208+17 plates (London Robert Hale, Ltd , 1954) 18*s* net.

THE author of this book is a New York insurance broker whose hobby is travelling in lands inhabited by primitive races. He is an expert photographer, and on his journeys he has sometimes had the aid of professional ciné-photographers His African film entitled "Savage Splendour" was a success Between 1940 and 1949 he made several expeditions to the north-west of the South American continent, from which rise the head-waters of the Amazon, and to country farther north around the Isthmus of Panama These are the areas inhabited by the Choco, Colorado and Yagua Indians, and include also the very isolated country of the Jivaro Indians, who are especially known for their custom of drying and shrinking the heads of their enemies The author has prepared commercial films relating to these journeys, and he has lectured much on his experiences This book gives a connected story and makes most interesting reading It contains a great deal of first-hand material which is of value to the anthropologist

While most of the tribes visited by the author are quite 'unspoiled' by contact with civilized peoples, the scientist will no doubt find his most interesting material in the sections which deal with the Jivaro Indians Mr Cotlow was able to become very friendly with several of their chiefs, and they informed him of the number of heads which they had taken during their lives He brings out forcibly the fact that the relatives of a man slain in battle are in honour bound to kill his killer and to shrink his decapitated head The relatives of this victim must retaliate in the same manner, so that inter-community warfare is almost continuous The author describes fully the method of shrinking a head Unfortunately, he did not actually see it carried out, since at the time of the raid he was stricken with dysentery He did see and photograph the victory-dance which followed the exploit. He also describes in detail the making of the fine blow-guns which are used by the Jivaros He frequently watched the use of the curare-tipped darts in killing animals. Birds died at once , monkeys survived between two and four minutes Larger animals were only irritated by these poisonous darts The author describes the use of the pincers of living ants for the purpose of suturing wounds He also describes an attack by the tiny, yet much dreaded, canero fish which embeds itself in the natural orifices of the body His comments on the food of the Indians are illuminating , for example, monkey stew he found not unacceptable, until he noticed a tiny hand floating in it During one of his trips to the natives he was made a blood-brother of the tribe, and it took him a week to remove the paint

This interesting and entertaining book is written modestly and without literary embellishment The author's sympathy with the Indians is apparent on every page E Ashworth Underwood

BIOCHEMISTRY OF CANCER

Biochemistry of Cancer

By Jesse P Greenstein Second edition Pp xiii+653 (New York Academic Press, Inc , London Academic Books, Ltd , 1954) 12 dollars

CANCER research and biochemistry are both wide and rapidly growing fields of study, so that Dr Greenstein has a wealth of material to discuss in this work He ranges from the study of theoretical chemistry in relation to structure of cancer-producing compounds to the structure of virus particles which can transmit malignant disease and the genetic factors in cancer

Dr Greenstein, who is chief of the Laboratory of Biochemistry in the National Cancer Institute Bethesda, Maryland, performed a most useful service to cancer research workers and biochemists when he published the first edition of this book in 1947. Since then many new facts have been discovered and hypotheses advanced, and these have been incorporated into the new edition by rewriting most of the book The work is divided into three main sections—the induction of cancer , attempts at control o tumour induction and tumour growth , and the properties of tumours

The processes of induction of cancer by viruses hormones, hydrocarbons, aromatic amines, aliphatic halogen compounds, metals, alkylating agents and radiations are all considered The section on contro of cancer induction and growth is still the smallest but it has increased in size relatively much more than the other parts of the book since the first edition The last section, dealing with the chemistry and biochemistry of tumours and tumour-bearing hosts occupies about half the book and is the field in which the author has made his own distinguished contributions This section is unique, as no other modern comparative account of the different properties o tumours is available

This new edition should be a great help to cance research workers , it would be even more valuable i the index were more complete and detailed Biochemists working in fields outside cancer research should find this monograph of interest

E Boyland

THERMONUCLEAR EXPLOSIONS AND THE WEATHER

By Sir GRAHAM SUTTON, C B E, F R S
Director of the Meteorological Office

THE poor weather experienced in the British Isles and generally in western Europe in the summer of 1954 came soon after the announcement by the United States Atomic Energy Commission that a series of thermonuclear explosions had taken place in the Pacific Perhaps not unnaturally, this coincidence caused speculation (unfortunately, often ill-formed and emotional) on the possibility of 'cause and effect'. The present article is an attempt to examine objectively if any grounds exist for suspecting a unique relationship between the man-made disturbances over the Pacific and the weather of mid-1954 in other parts of the world.

Such an investigation is difficult for a variety of reasons Weather is the first-order perturbation of climate and since (as shown below) the weather of 1954 did not exhibit, in the British Isles, any features that cannot be paralleled and even exceeded in past years, it follows that any effects attributable to the explosions must be of magnitude not exceeding that of ordinary weather-producing influences The detection of such additional effects, therefore, demands careful statistical analysis that cannot properly be attempted until several years have elapsed, so that existing climatic 'trends' (see below) can be recognized and eliminated An equally serious difficulty is that, so far, it is not known with certainty how many thermonuclear explosions occurred in 1954, or when and where they all occurred From Press reports, it is possible to make what is thought to be a reasonable estimate of the order of magnitude of the energy release in the largest of the Pacific explosions, but almost all other details are lacking

These factors, combined with present uncertainty concerning the mechanism of many fundamental atmospheric processes, such as the formation of depressions and the precipitation of water, make it mpossible to give a rigorous demonstration of the truth or falsity of the proposition that thermonuclear explosions were responsible for, or even contributed materially to, the poor summer of 1954 in western Europe At this stage the most that can be attempted s an examination of the plausibility of what is, for many people, a firmly held belief

Evidence from Meteorological Records

In the British Isles the summer (June, July and August) of 1954 was cool, wet and dull In England and Wales, in eighty-four years of comparable records here have been only six wetter summers, but in Scotland twenty-five summers gave a greater total ainfall No rainfall records were broken or even approached—1879 and 1912 had each about 4 in. of ain in excess of the total, for the whole country, of nearly 12 in for the past summer At Kew (for which station the records are unusually long and reliable) 1954 with a total of 9 5 in. for the summer alls far below the record year, 1903, in which 15 4 in ell in the three summer months In the present entury alone, 1924, 1927 and 1946 had each more wet days in summer than 1954

The season was decidedly cool, and of the past fifty-three summers only two, 1907 and 1922, had lower mean temperatures in England and Wales Sunshine also was lacking, and the only summer with a worse record in this respect since 1906 was 1912 (also a year with a wet summer)

In Western Europe, weather was generally cooler and wetter than usual, but there were notable exceptions June temperatures were above average in many parts, and in July, France had less than the normal rainfall In the United States and in the U S S R (so far as records are available) the summer was, on the whole, warmer than average and in the United States it was somewhat drier (July 1954 was, in fact, one of the hottest months ever recorded in the central United States) South and west Africa had wetter and cooler seasons than usual and Indian monsoon rains were generally above average Rainfall was also above average in Japan and Malaya

The world-weather picture of mid-1954 is thus complex, but not more so than usual. The most striking feature is that large areas of the globe experienced more cloud and rain and were somewhat cooler than would be expected from long-term averages

The climatological pattern for the British Isles in recent years has been examined by Dr J Glasspoole, head of the British Climatology Branch of the Meteorological Office, in a paper shortly to appear in the *Meteorological Magazine*. The climate of these islands, as indicated by long-term averages, is very stable, but over any period of years there are definite oscillations (called 'trends' by meteorologists) of variable length and amplitude Such major oscillations are clearly shown when yearly variations are minimized by plotting 10-year moving averages The curves so obtained show maxima and minima at irregular intervals, for example, the 10-year moving averages of summer temperature for England and Wales during 1901–53 begin well below the mean line, increase fairly rapidly and rise above the mean in the periods 1922–31 to 1929–38 and are now descending The corresponding rainfall curve shows a pronounced maximum in 1873–82, which has not been reached again, but the curve, after some smaller oscillations about the long-term mean, is now ascending The current trend in summer sunshine is also towards lower values

These results suggest (but do not positively demonstrate) that the weather of the past summer continues a general trend that has been indicated for some years past. This suggestion cannot be properly examined until future years have produced more observations, but at least it indicates the possibility that cool wet summers will not be infrequent for some years to come It should be pointed out, however, that such 'trends', although of great interest to the climatologist, are of little or no value as a basis for long-range forecasts, and it is possible for the summer of a single year (such as 1955) to be warm and dry without affecting significantly the general character of the current trend In the present connexion the analysis may be significant in that it suggests that the summer of 1954, although extreme, did to some extent conform to an existing pattern and therefore need not have been influenced by artificial causes

The anatomy of the pressure field during the summer reveals some interesting features. Two types of patterns dominated one in which depressions approached the British Isles from the north-west (this type was persistent in a period near the end of June and the early part of July) and another (chiefly responsible for the large rainfall totals in southern England in August) characterized by the approach of depressions from the south-west Examination of 5-day means for the northern hemisphere indicates that a pattern with three major long waves was established before the beginning of July and persisted through much of August

Present-day knowledge of the general circulation, and of the mechanism of the formation and steering of the large slow-moving disturbances of the atmosphere over the Atlantic, is inadequate to relate such patterns to isolated large displacements of air occurring in, say, the Pacific. However, the relative stability and persistence of the patterns do not suggest a unique connexion with explosions. Left to itself, the kinetic energy of an atmospheric disturbance is reduced fairly rapidly by eddy friction, and Brunt[1] has estimated that in these conditions the general circulation would practically cease in less than a week Press reports indicate that there must have been intervals of some weeks between the known explosions, and it may therefore be supposed that the direct effects of the trials would be felt as isolated bursts of bad weather with intervening settled spells Actually, the unsettled showery type persisted throughout the summer, and there were no well-developed spells of fine weather in the British Isles

Thus both the climatological and aerological evidence are unfavourable to the suggestion that thermonuclear explosions, so far as they are known to have occurred, ruined what might otherwise have been a fine summer. The weather experienced in the British Isles was well within the established climatic range, and taking all facts into account, it is evident that it would be exceedingly difficult, if not impossible, to establish a 'cause and effect' sequence on purely meteorological grounds What evidence exists points, in fact, to the opposite conclusion

Dates and Orders of Magnitude

The difficulties of direct investigation of the effects of thermonuclear explosions, intrinsically very severe, are enhanced by lack of information concerning the events. The earliest thermonuclear trial seems to have been that conducted at Eniwetok in November 1952, which was declared by President Eisenhower on March 12, 1953, to have been a full-scale 'hydrogen' explosion On August 20, 1953, *Pravda* stated that "a few days ago one of the types of hydrogen bomb was exploded" This was confirmed by the U S Atomic Energy Commission on the same day, and the actual date was given as August 12, 1953 , but no information has been published concerning the place of the trial or the magnitude of the energy release On March 1, 1954, the Atomic Energy Commission announced that an 'atomic device' had been detonated in the Marshall Islands, and on March 29, 1954, Admiral Strauss referred to this as a "thermonuclear device", adding that a second thermonuclear explosion had been set off on March 26 Finally, on May 13, 1954, Admiral Strauss announced the completion of a series of tests in the development of thermonuclear weapons , but the number and dates of the events have never been announced

It is seen from the above that the known thermonuclear explosions have extended over a considerable period of time, with presumably a maximum frequency in the spring of 1954 Statements by the U S authorities indicate that at least one explosion was about six hundred times as powerful as the Nagasaki bomb This indicates an energy release of the order of 10^{16} gm cal. Shaw[2] has estimated that the kinetic energy of an average cyclonic disturbance, 10 mb deep and 1,400 km diameter, is about 3 5 × 10^{16} gm cal , and Brunt (quoted by Shaw) has calculated that the kinetic energy of the general circulation of the atmosphere is of the order of 7 × 10^{19} gm. cal. Thus the energy release in what is thought to have been the most violent explosion to date is equivalent to the addition of one rather small depression to the atmosphere, or to an increase of the kinetic energy of the whole circulation by slightly more than one part in ten thousand, assuming that the whole of the energy released appears as energy of motion. Atmospheric turbulence has been estimated by Brunt to dissipate kinetic energy at about 1 gm. cal per square metre per second, so that those who seek support for the theory that the effects of the explosions were felt all over the world in increased cyclonic activity, lasting for many months, are faced with a difficult task Even in the case of the largest volcanic explosions, any strengthening of the general circulation is not detectable more than six months after the event[3] It seems that the only really hopeful line of support for such theories is to be found in the examination of subsidiary effects such as the action of dust, and that the direc dynamical consequences must have been confined to the vicinity of the trials

Possible Effects of Dispersed Debris

The theory that volcanic eruptions, by ejecting immense clouds of finely divided matter into the upper atmosphere, can cause notable changes in the amount of solar radiation reaching the surface of the earth and are usually followed by cool, wet weathe or even severe winters, was advanced by the late W J. Humphreys and given much prominence in hi well-known book "The Physics of the Atmosphere" Two possible examples taken from the climatic record of Great Britain are 1903, which was preceded by the eruption of Mt Pelée in 1902, and 1912, which coincided with the eruption of Katmai (Alaska) Both these volcanoes are well placed to cause pollution of the upper atmosphere over Europe Humphreys's theory has not found universal acceptanc among meteorologists and there is little direc evidence of notable climatic effects from the dus clouds. Thus Shaw[4], after pointing out that "th additional short-wave radiation that reaches a horizontal surface in consequence of the scattering b dust particles seems to go some way towards compensating the surface for loss of direct radiation o account of obstruction by the dust", states tha 1912 showed a more abundant supply of solar energy at South Kensington than did the years immediately preceding and following the eruption of Katmai.

The amount of debris thrown into the upper atmosphere by the Pacific explosions was almost certainly less (probably by several orders of magnitude) than that ejected in the Krakatoa explosions. There is no evidence of abnormal weather in England following this eruption, although the optical effects of the dust were evident all over the world. At Pavlovsk, the Katmai eruption may have been responsible for a reduction of about 20 per cent in the solar radiation, and Kimball's analysis indicates that the total radiation received on a horizontal surface at Mount Weather in the months following the same eruption was, on the whole, about 5 per cent below that of the following year. Brooks[5] concludes that the only appreciable climatic effect of volcanic dust is a general cooling; but it is obvious that such effects can be detected only with the largest eruptions. As solar radiation records generally show considerable 'noise', it seems likely that the effects of thermonuclear dust clouds on the radiation income of Europe will be difficult to detect and probably impossible to assess with any degree of confidence. So far, there has been no indication of any reduction of solar radiation in the British Isles that can be attributed to pollution arising from thermonuclear explosions.

Whether dust clouds of themselves can cause notable augmentation of precipitation is not easily decided. Orthodox meteorological theory excludes ions and all non-hygroscopic particles as nuclei of condensation because of the high relative humidity required. Although direct evidence is lacking, it is very unlikely that relative humidities greater than a fraction of one per cent supersaturation over a pure water surface are ever encountered in the free atmosphere[6]. Observational material accumulated to date points to sea salt as the principal nucleus of condensation, although the oxides of sulphur and nitrogen may play some part. The evidence is not entirely clear, but it is generally accepted by meteorologists that the air over a maritime country like the British Isles has always a sufficiency of nuclei of condensation of finite size for the formation of rain.

If a drop carries an electrical charge of q e.s.u. on its surface, the equilibrium vapour pressure is given by

$$\rho_w R_w T \ln\left(\frac{e}{e_s}\right) = \frac{2\sigma}{r} - \frac{q^2}{8\pi r^4},$$

where ρ_w is the density of water, R_w is the gas constant per unit mass of water vapour, T is the ambient temperature, e and e_s are the vapour pressure and saturation vapour pressure, respectively, σ is the surface tension and r is the radius of the drop. Johnson[6] states that even in thunderstorms, where the drops carry relatively high charges, the term which represents the effect of the electric charge is of negligible importance in the determination of the rate of growth of the droplet. It has not proved possible to compute a likely value for the charge on a drop encountering the radioactive cloud from a thermonuclear explosion several days, or weeks, after the explosion; but it is clear that unless very high charges are acquired, the rate of growth of droplets in the free atmosphere is not affected. The conclusion is thus that it is exceedingly unlikely that radioactive material, whether from a bomb or an atomic pile, can cause any significant increase in rainfall experienced over a large area. In particular, nothing like the classical cloud-chamber process can be envisaged because of the high degree of supersaturation needed.

The World Meteorological Organization is now endeavouring to collect information from member-nations about atomic explosions and climatic effects. How far this appeal has succeeded is not known, and it may be that in the light of further information some of the arguments given above may need revision. Even so, the present state of meteorological knowledge renders it unlikely that a firm conclusion can be reached; but so far the available evidence points to the conclusion that recent thermonuclear trials cannot be held responsible for any world-wide extremes of weather encountered in 1954.

ORIGIN AND AGE OF METEORITES

By PROF. HAROLD C. UREY, For. Mem. R.S.

Institute for Nuclear Studies, University of Chicago

BOTH privately and publicly (meeting of the American Association for the Advancement of Science, December 1953, and the Rome meeting of the International Union of Geodesy and Geophysics, September 1954) I have expressed the view that the ages of iron meteorites determined by the helium method are meaningless. Paneth and his collaborators[1] have developed most elaborate and careful methods for the determination of helium and uranium in iron meteorites. The first results were interpreted on the assumption that all the helium was radiogenic, and widely varying ages were secured. Bauer[2] and Huntley[3] pointed out that the helium might well have been produced by cosmic rays, and Mayne[1] showed that helium-3 was indeed present and hence that the helium was partially non-radiogenic in origin. Then subtraction of the estimated amounts of non-radiogenic helium made possible a corrected estimate of the ages from the remaining radiogenic helium. The ages so secured were small, namely, of the order of 10^8 years or less.

Uranium and thorium are exceedingly electropositive elements and they should not be present in the iron meteorites at all, assuming that Goldschmidt's theory for the distribution of elements between the silicate, troilite and metallic phases is correct. The standard free-energy changes for the two reactions

$$UO_2 + 2Fe = U + 2FeO$$

$$ThO_2 + 2Fe = Th + 2FeO$$

are 126.4 and 138 kcal. respectively at 2,000° K., which is some 200 deg. above the melting point of the iron–nickel alloy. The activity of the iron in the metal is about unity and that of the iron oxide in a silicate melt of meteoritic composition is about 0·13. Hence the ratio of uranium concentration in the metal to the uranium oxide concentration in the silicate melt should be

$$\frac{[U]}{[UO_2]} = K\,\frac{[Fe]^2}{[FeO]^2} = 10^{-13 \cdot 8} \times \frac{1}{0 \cdot 13^2} = 9 \cdot 4 \times 10^{-13}$$

The corresponding value for $\frac{[Th]}{[ThO_2]}$ is $3 \cdot 5 \times 10^{-16}$.

It is obvious that except for small amounts due to occlusion or very slight solubility of oxides in the metal phase, uranium and thorium should be much less abundant in the metal phase than in the silicate phase. It may be that their sulphides might be somewhat more stable and that these elements might be present in the troilite phase. One concludes that any uranium and thorium in the iron meteorites are in the silicate or sulphide inclusions. Hence radiogenic helium might escape from the iron meteorites along the fissures that are always present in these objects.

If the iron meteorites were formed by a collision between two asteroids some 10⁸ or so years ago, it might be assumed that in the collision which broke up the asteroids the iron melted and the radiogenic and cosmic ray helium formed up to that time was lost. Then the calculations on the ages from the cosmic and radiogenic helium could reasonably be made. But how could the Widmanstatten figures form, since the iron meteorites would cool rapidly and become ordinary iron–nickel steel? This series of events must be rejected because of this difficulty. Another supposition would be that in the collision the irons were not heated to high temperatures and thus retained their Widmanstatten figures, but that the radiogenic helium formed previously and after the time of break-up leaked from the meteorite because it was formed in the occlusions. Since we do not know what fraction of the radiogenic helium was lost, we cannot calculate the age. Paneth *et al.* suggest that the iron meteorites have lost their helium as they passed near the sun. This means that a particular meteorite had an orbit passing near the sun until a time equal to the age which they calculate. Then some close approach to one of the planets perturbed the orbit until the meteorite did not pass near enough to the sun to lose its helium. The Widmanstatten figures were presumably formed during the time of near approach to the sun, or these figures acquired in some earlier process were not destroyed during this time. Then the age records the time since the perturbation occurred. It seems possible that such a series of events occurred in a few cases; but it is most improbable that it occurred in every instance, and thus for most of the meteorites the two alternate courses of events or others must be assumed. While the excellent studies of Paneth and his co-workers are most interesting because of the facts which they present about the formation of meteorites and the effects of cosmic rays, I believe that it is very difficult to decide what event or events were recorded by the helium, uranium and thorium abundances.

At the December 1953 meeting of the American Association for the Advancement of Science, Dr. H. Craig pointed out that the iron meteorites form three rough groups on the basis of nickel content, and that two of these can be correlated with the two prominent groups of chondrites on the basis of equality of nickel content between the irons and the metal phase of the chondrites[4]. Also, plessite, kamacite and tænite, the iron–nickel alloys forming the Widmanstatten figures in iron meteorites, are found in chondritic meteorites[5]. It seems likely that the differentiation of the iron and stone meteorites occurred at the same time and in some closely related processes[6]. At least some metallic iron containing both kamacite and tænite and some crystalline silicate such as that of the achondrites was formed, presumably by melting and crystallization processes prior to the agglomeration of the chondrites. Many studies of these objects show that they have been formed by the agglomeration of fragments of silicates, drops of molten silicate glasses which have been only partly crystallized, and bits of iron–nickel alloys of the plessite, kamacite and tænite varieties. The bent bits of iron, broken crystals and the chondrules which were once molten drops indicate that the process was one of considerable violence, certainly sufficiently so to remove radiogenic argon from the potassium-containing minerals, which are generally among those of lowest melting points.

Recently, Wasserburg and Hayden[7] have shown by the potassium-40/argon-40 method that the ages of two chondrites, Forest City and Beardsley, are 4·6 and 4·8 × 10⁹ years respectively. These are the times since the radiogenic argon was removed from these objects, and they have not been melted or heated to temperatures of, say, about 1,000° C. during the past 4·5–5 × 10⁹ years. The time of formation of these objects was that of the origin of the solar system or earlier. Such ages depend critically on the potassium and argon analyses, which were made by isotope dilution methods at the University of Chicago and the Argonne National Laboratory under the supervision of Dr. M. Inghram and myself. The potassium analysis was checked by another method developed by Dr. G. Edwards and me[8]. These latter analyses show that the chondrites have a remarkably constant amount of potassium near 0·088 per cent. Potassium-40/argon-40 ages of two chondrites have been reported by Gerling and Pavlova[9]. These are given as 3 × 10⁹ years. Their analyses for potassium are 0·18 and 0·17 per cent, twice the average of Edwards's and Urey's analyses and much higher than their maximum value of 0·1024 per cent for the Beardsley meteorite. Whether the difference in ages is real, or due to errors in potassium analyses, or to loss of argon by heating during geological time is difficult to say, though I suspect that these chondrites, like the others, have smaller amounts of potassium than those reported, and hence their ages may indeed fall in the 4·5–5 × 10⁹ year-range. Patterson and Hayden[10] have found evidence from the ratio of lead-206 to lead-207 in the stones and irons for similar ages, and this means that the lead, which is chalcophile and is in the iron sulphide phase, and uranium and thorium, which are in the silicate phase, have not been separated by melting in this length of time. Since the fragmentation process which formed the chondrites was very energetic, as shown by the evidence that the chondrules were melted, argon must have been lost during the process. Hence this process occurred before the time of the recorded ages.

But the agglomeration into the solid bodies of the chondrites also took place at this time. Any bits of iron, broken crystals and chondrules moving in space near the asteroid belt would have been drawn to the sun in a short period of time by the Poynting–Robertson effect[11] and thus would not have fallen on the larger asteroids, for example, except for a limited period of time. Much of the differentiation of the meteorites by melting, crystallization, fragmentation and agglomeration took place during the formation of the solar system and not since then, and especially not in the past 10^8 years

Wahl[12] has suggested that the black chondrites are white chondrites which have been heated above the melting point of iron sulphide (~ 1,200° C.) The black veins of some chondrites have the same chemical composition as the lighter material adjacent to them and thus seem to have been heated by a slip process during the supposed asteroidal collision which produced them. It will be interesting to study the ages of these objects as well as those of the achondrites and stony irons by the potassium-40/argon-40 method as a means of determining the times of these heating processes. Some time ago, Prof. W. Wahl showed me a beautiful series of chondrites ranging from the very oose structure of Bjurbole type through the white and grey chondrites to the black chondrites, indicating different degrees of heating. Also the calcium-poor achondrites, which Urey and Craig suggested may be melted chondrites, show evidence of heating It will be interesting to secure ages of these objects as a means of estimating the times of these heating processes One hint in regard to the results to be expected comes from Wahl's[13] study of the polymict stone meteorites. Thus black chondritic material with small enclosures of white chondritic material is enclosed in grey chondrite in the Hainaut meteorite Other examples are given by Wahl It seems most ikely that all heating except that due to collision processes occurred before the conglomerates of the chondrites were produced But regardless of the esults of such experiments, the results obtained by Wasserburg and Hayden show that the principal differentiations occurred during, or perhaps even prior to, the formation of the solar system.

Kuiper[14] suggested that the melting processes which obviously have occurred in meteoritic material were produced by radioactive heating during the rst part of geological time after the planets were ormed. This seems not to be the case unless the olar system was formed longer than 4 5 × 10^9 years go. The exact time required for melting is in doubt, ecause of current uncertainties in regard to the osmic abundances of uranium, thorium and potassium. Hence the course of events on this assumption would be an accumulation at low temperature of ubstantial bodies of low conductivity, followed by a ong period (~ 10^9 years perhaps) during which they were heated by radioactive heating until they melted, and then an active brecciation by processes ncidental to the formation of the solar system some 5–5 × 10^9 years ago, which produced the chonrites, and finally no heating processes since then. his means that these asteroidal objects and the sun resumably must have been formed at the same me, that is, before the universe is currently assumed o have originated, some 5 0 × 10^9 years ago—a urprising conclusion for a star of Population I. But erhaps, as I have suggested[15], it may be that these bjects, which I called planetesimals, antedated the olar system. Or the universe has no age, as the roponents of continuous creation maintain. Or, it may be that the elements were synthesized or their bundances readjusted to some extent during the ormation of the sun, and nuclides of shorter halfves such as chlorine-36 or cæsium-135 heated these bjects In this event objects of considerable size formed very quickly after the origin of these elements. Or other heating processes occurred as I have suggested. But the simplest assumption is that the universe and solar system are older than we have thought, and that Population I stars are indeed old stars and not even only moderately old stars. Of course, simple assumptions are not necessarily true.

In summary, it seems probable to me that at least most of the meteorites, stones, irons and stony irons have not been heated markedly since the solar system was formed some 4 5–5 × 10^9 years ago, and that the processes by which they were formed were indeed part of the early history of the solar system. The ages of iron meteorites determined by the helium method are probably in error because of a leak of the radiogenic helium This helium was produced in silicate or sulphide (?) inclusions, and hence leaked more or less rapidly along fissures which are present in these objects

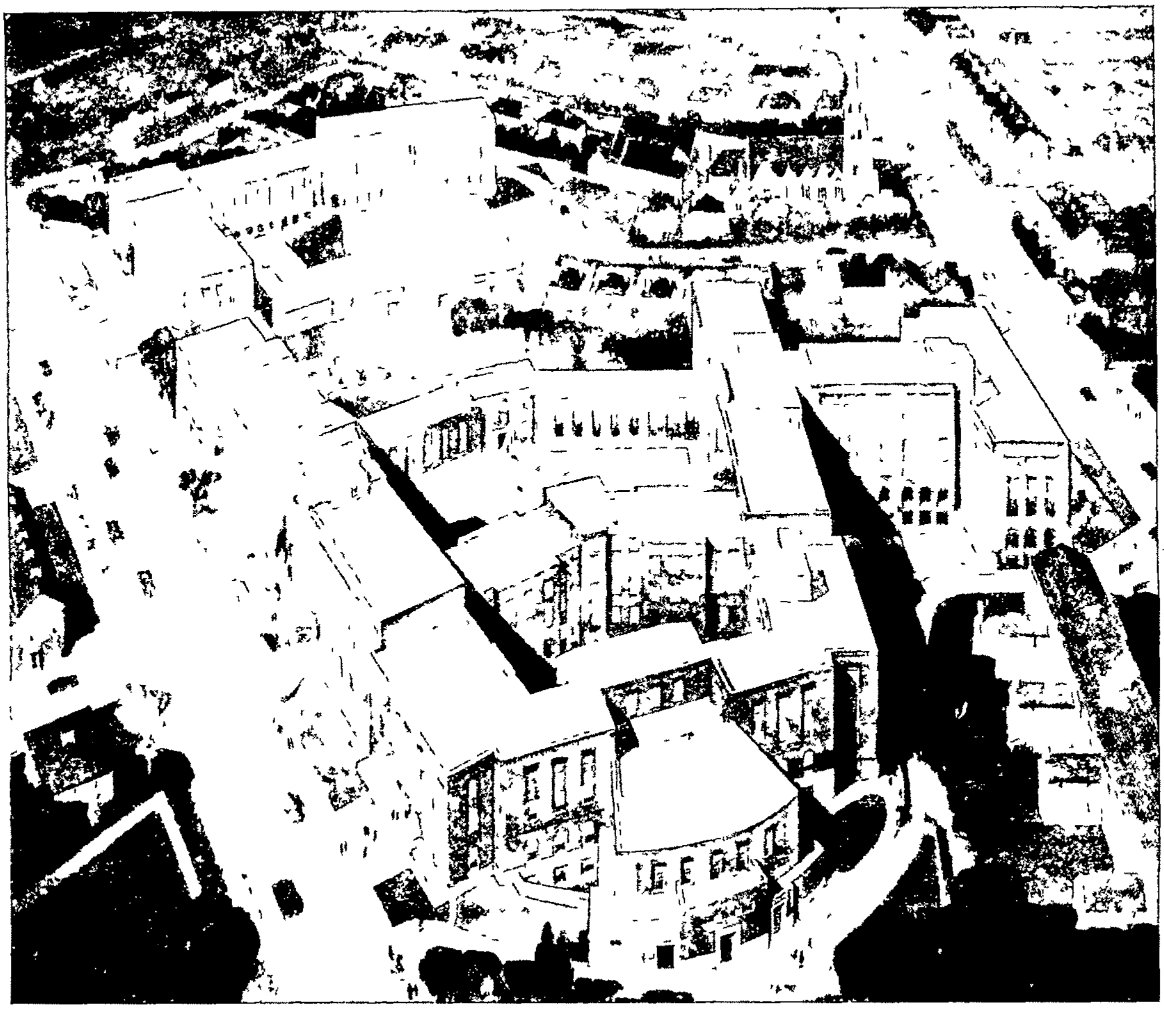
HIGHER TECHNOLOGICAL STUDIES IN NORTHERN IRELAND

By Dr ERIC ASHBY

Vice-Chancellor, The Queen's University, Belfast

IN December 1954 the Royal Assent was given to a Bill in the Northern Ireland Parliament which enables a new experiment to be made in the organization of higher technological education. Hitherto, higher technology has been divided between the Queen's University of Belfast (which concentrated upon civil engineering) and the Belfast College of Technology, which provided, among other subjects, for mechanical, electrical, and aeronautical engineering and chemical technology The University's Faculty of Applied Science was, at it were, a guest in the laboratories of the College of Technology (an arrangement not unlike that which exists in Manchester), and the staff were officers of the Local Education Authority

After long and friendly negotiations between the University and the Corporation of Belfast, the conclusion was reached that it would be undesirable in a small Province with a population of 1 3 millions to duplicate facilities for higher technological education in the University and the City. It was agreed, too, that higher technological education, including Higher National Certificate work, should be separated from more modest forms of technological education. The



Architect's sketch (Messrs. Lanchester and Lodge) of the Science and Engineering Buildings now being erected at the Queen's University, Belfast

solution to the problem seemed to be to set up first-rate facilities for teaching and research in higher technology, and to give both the University and the City access to these facilities. This has been accomplished in the following way: (1) Beginning with mechanical and electrical engineering, the University will appoint all teaching staff concerned with work in the Faculty of Applied Science at university salary rates and on the F.S.S.U. (2) Some (but not all) posts on the teaching staff will include obligations to Higher National Certificate students, and the City will contribute to the University part of the salaries of these posts. Other posts may be concerned solely with Higher National Certificate work: these will remain under the local authority. The control of the Faculty of Applied Science will, of course, lie completely with the University.

The Departments of Mechanical and Electrical Engineering, at present located in the College of Technology, will move ultimately to a building (shown at the top left-hand corner of the accompanying architect's sketch) in the new science and engineering site of the Queen's University. The main block of new buildings on this site is at present in construction and will be ready for occupation in 1958–59. The block facing the road on the left is to accommodate civil (and temporarily electric engineering, the block facing the road on the rig is to accommodate botany and zoology, and t intervening block and two of the three cross-win are to accommodate chemistry. The third cross-wi (a single-story building) is to accommodate t Aeronautics Department endowed by Messrs. Sho Brothers and Harland, together with a hydrauli laboratory. A branch of the University Librar containing sections on engineering, chemistry a the biological sciences, will be accommodated in t building.

These new buildings are less than five minut walk from the centre of the University, and t Senate has therefore made no provision for meals student common rooms in the buildings, in the ho that science and technology students would there be persuaded to meet students from other facultie at least at meal times. The size of the buildings sufficient to accommodate adequately the prese numbers of University students: some 380 science, 150 in first-year medicine and agricultu and 460 in applied science and technology, togeth (ultimately and when the second block is complet with some 500 students taking Higher Nation Certificate.

CARL FRIEDRICH GAUSS AS A PHYSICIST

By Dr N. DAVY
University of Nottingham

THE name of Gauss is worthy to stand beside that of Newton and Archimedes. Born on April 20, 1777, the son of a bricklayer at Brunswick, Germany, he early displayed great mathematical ability. In 1807 he became director of the new astronomical observatory at Gottingen, and professor of astronomy in the university there. Working hard and continuously, not seeking new positions, and seldom leaving his observatory, he eventually died there on February 23, 1855 Space will not permit the analysis of many of his 124 memoirs, all significant, catalogued by the Royal Society, and his biography must also be sought elsewhere[1,2]. In the first part of his life, Gauss devoted himself in turn to the theory of numbers, algebra, general analysis, astronomy and geodesy His mighty works in these subjects were described long ago by able pens[3-5] The purpose of the present article is to survey briefly Gauss's work in physics

About the year 1831, when Wilhelm Eduard Weber became professor of physics at Gottingen, Gauss became interested in terrestrial magnetism The great problem then was—as it still is—to find the source of the earth's permanent magnetic field Halley (1692), following on the work of Gilbert (1600), had suggested that the field might be ascribed to a set of four magnetic poles. Some meagre data to test this had been accumulated by 1831, when philosophers were measuring, at irregular times and at a few scattered places, the three so-called elements of the terrestrial field These were the angle of variation, now called declination, the angle of inclination or dip, and the intensity of the field The venerable Humboldt, both by precept and example, emphasized the need for measuring the third element, as well as the others, with the utmost precision.

Humboldt and Arago were the first to establish magnetic observatories, in buildings free from iron In 1833 Gauss and Weber constructed an improved observatory of this type at Gottingen, in which the declination apparatus, unifilar and bifilar magnetometers were all invented by themselves. This observatory and the procedure adopted therein soon became a model for others throughout the world Gauss's first memoir on terrestrial magnetism was written in Latin, in the grand classical manner of Gilbert and Newton It was called "Intensitas vis magneticae terrestris ad mensuram absolutam revocata" (1832) Improving on the work of Poisson (1828), he here introduced his method of measuring *H*, the horizontal component of the earth's field The same paper also contained Gauss's method of proving experimentally the law of inverse squares, which at first assumes a law of the inverse *n*th power and goes on to show that *n* is equal to two A third manifestation of genius, in the same memoir, was the introduction of absolute units into physics. As measured at Gottingen, at 5 p.m on September 18, 1832, the value of *H* was found to be 1·782088, which Gauss only claimed to be accurate as far as 1 7821, in terms of the millimetre, the milligram and the second, as units of length, mass and time In the middle of such researches, Gauss and Weber (1833) constructed what has been called the first practical electro-magnetic telegraph, using wires connecting the astronomical and magnetic observatories at Gottingen The distance was about 3,000 ft

The name 'gauss' was first fittingly bestowed on the unit of magnetic intensity More recently, it has been replaced in that connexion by the term 'oersted', and the gauss is now the unit of magnetic induction, but numbers of physicists and engineers, reluctant to change with the fashion, persist, in private, in calling the unit of magnetic intensity a gauss, a name for which they have acquired a certain affection

To procure accurate and extensive data so that a proper theory of terrestrial magnetism could be developed, Gauss, from 1831 onwards, organized a Magnetic Union of observatories. At places throughout Europe, daily measurements of the three elements were made at the same moments and at the same regular intervals. By the efforts of Sabine and Lloyd, and following a letter by Humboldt (1836) to the Duke of Sussex, then president of the Royal Society, the British Government was persuaded to assist, very heartily and effectually, by erecting magnetic observatories at home and in the Colonies A special expedition of two ships, the *Erebus* of 370 tons and the *Terror* of 340 tons, under Ross, was sent to the Antarctic in 1839, with the primary object of making magnetic measurements in a region concerning which earlier information was very scanty. Other governments, especially that of Russia, gave their support, and in 1840 it was reported that thirty-two new observatories were established, or nearly so. For the sake of comparison it may be noted that in 1940 about seventy-five magnetic observatories were in operation, some in polar regions, not only measuring the elements at regular intervals, but also making continuous recordings of their fluctuations, now called 'variations'.

We now turn to Gauss's theoretical work. He had no theory of magnetism itself. He was concerned with terrestrial magnetism, the phenomena of which may be divided into the permanent main field and its variations, daily, monthly, annual, secular and non-recurrent (magnetic storms).

Neglecting the variations, in the memoir "Allgemeine Theorie des Erdmagnetismus" (1838), Gauss's purpose was to discover the law or formula which accounts accurately for the permanent magnetic potential and field everywhere on the earth's surface. The theoretical tools were at hand, thanks to Laplace and Legendre Gauss assumed that the potential, at any point on the earth's surface, was a solution of Laplace's equation He assumed also that the field was wholly due to sources inside the earth, and that the potential *V* could be written as the convergent series

$$V = S_1/r^2 + S_2/r^3 + S_3/r^4 + S_4/r^5 + \ldots$$

terms after the fourth being negligible. Here *r* was the distance of the point from the centre of the earth, and S_1, S_2, S_3, S_4 were surface harmonics, functions of the latitude and longitude of the point. The first term could be regarded as due to a uniform magnetization of the earth, or to a small magnet placed at the centre The other terms could not be interpreted physically. S_1, S_2, S_3 and S_4 were expressed in terms of twenty-four constants and trigonometrical functions of the latitude and longitude. This could not be done accurately with the older observations, and Gauss acknowledged that it was the publication in

1838 of Sabine's tables and chart of lines of equal total intensity, in the seventh report of the British Association, which inspired him to complete the laborious task. He also used the inclination (dip) chart by the German, Horner, and the declination chart of Barlow. Gauss then tested his formula by calculating fields at new points, and also the positions of the terrestrial magnetic poles. These last he predicted, in 1838, to be near 73° 35′ N, 95° 39′ W., and 72° 35′ S, 152° 30′ E, respectively, long before Amundsen (1903–6) found the North Pole to be at 71° N, 96° W, and the Discovery expedition (1902–4) found the South Pole at 72° 50′ S., 156° 20′ E. Thus Gauss laid a firm foundation for the theory of terrestrial magnetism on which Schuster, Gunn and others have built Using the better observations of 1885, Neumayer recalculated the twenty-four constants. Schmidt (1889) found that 1 per cent of the field was due to external sources Later still, in 1923, Bauer found that 3 per cent was due to a potential arising from external sources, 94 per cent to a potential arising from internal sources and 3 per cent, of non-potential origin, to electric currents in the atmosphere, but this last result is disputed by some authorities. Chapman has shown that about 72 per cent of the diurnal variation is due to external, and 28 per cent to internal sources The quality of Gauss's work is indicated by the following comment by Clerk Maxwell "Gauss, as a member of the German Magnetic Union, brought his powerful intellect to bear on the theory of magnetism, and on the methods of observing it, and he not only greatly added to our knowledge of the theory of attractions, but reconstructed the whole of magnetic science as regards the instruments used, the methods of observation, and the calculation of the results, so that his memoirs on Terrestrial Magnetism may be taken as models of physical research by all those who are engaged in the measurement of the forces in nature".

Maxwell's reference to attractions probably relates to Gauss's memoir, "Allgemeine Lehrsatze in Beziehung auf die im verkehrten Verhaltnisse des Quadrats der Entfernung wirkenden Anziehungs- und Abstossungs-krafte" (1840) These theorems relate to gravitation, electrostatics and magnetism. Among them we find that celebrated theorem, Gauss's theorem *par excellence*, showing that the total normal outward flux of force over a closed surface is 4π times the electric charge or magnetic pole-strength enclosed, or $4\pi G$ times the mass enclosed.

Much of Gauss's work in pure mathematics has contributed, since his time, to advances in electricity and magnetism. For example, in order to calculate the magnetic field of a two-dimensional pole-piece the cross-section of which is a curvilinear triangle, and the sides of which are circular arcs, one must first use Gauss's concept of a conformal transformation to change the edge of the triangle into the real axis of another plane This is done by the aid of Gauss's hypergeometric equation, which is solved by Gauss's methods.

Turning to optics, we find another manifestation of Gauss's power in the memoir "Dioptrische Untersuchungen" (1840). Here the concept of principal points was introduced, a concept which reduced the laborious mathematics of thick lenses and sets of coaxial lenses almost to the easy algebra of single thin lenses. Gauss's ideas were extended in 1845 by Listing, who discovered nodal points. Along with this may be mentioned, as a bagatelle of genius Gauss's optical invention called a heliotrope (1821) based on the law of reflexion of light by plane mirrors and useful in geodetic work for sending signals o sunlight to distant points

Like Newton, Gauss wrote a "Principia", not bound book, but a memoir called "Principia generali Theoriae Figurae Fluidorum". To Gauss this was jus a trifle, but it alone would have made the name of lesser man. The principle of virtual work and th calculus of variations were applied to a liqui standing in a capillary tube. The differential equatio of the free surface and Young's equation relating t angles of contact were deduced in an elegant manne free from a defect which vitiated Laplace's treatmen of the same topic.

Gauss never rushed into publication. As the year passed, he became more and more averse to it o indifferent to priority. Von Waltershausen tells u that in 1831 Gauss suddenly took up crystallography quickly mastered it in a few weeks and as suddenl relinquished it. His unpublished note-book shows tha he had largely forestalled the later work of Miller.

There is no space to relate all Gauss's persona peculiarities, his virtues and failings, his literar style, his veto on the taking of notes of his lecture by his students, his adverse opinion on Abel's firs great paper, and so forth. We trust that enoug evidence has been adduced to show that, in bot theoretical and experimental physics, Gauss was a great a master as in mathematics and astronomy and that, as Johnson said of Goldsmith, he touche nothing which he did not adorn.

OBITUARIES

Prof. G V Anrep, F.R.S

Prof. Gleb Vasilievitch Anrep, who died Cairo on January 9, was one of the outstandin physiologists of his generation. He was born in St Petersburg in 1891, the son of Basil Anrep, professor o pharmacology in the Military Medical Academy, wh discovered the local anæsthetic action of cocaine, an who was of Swedish extraction. Gleb Anrep studied a the Military Medical Academy, where he came unde the compelling influence of I. P. Pavlov, commencin research work on the conditioned reflexes while stil a student. He was not yet qualified when 'Iva Petrovitch' sent him in the vacation of 1912 to visi Starling, in order to demonstrate to him the effect o vagus stimulation on the secretion of pancreati juice, and to acquire the method of preparing pan creatic secretin. He already spoke tolerable English and soon became fluent during that and two simila visits in the next two years, when he worked unde Starling at University College, London. The thir visit was curtailed by the outbreak of war in 1914 when he returned to Russia, completed his quali fications, and joined the Army, in which he serve until 1917 as a medical officer. He then returned t Petrograd, studied at the Institute of Experimenta Medicine, and took his M D Being opposed to th Revolutionary Government, he joined the ant

Bolshevik forces of General Denekin in 1918, remaining with them until their defeat, after which, with the help of Starling, he came to England, and worked as a lecturer at University College until 1926, taking a D.Sc He became naturalized in 1925, and was made a Fellow of University College in 1928.

In 1926 he moved to Cambridge, as lecturer in physiology, was awarded an M A., and in 1928 was elected a Fellow of the Royal Society.

In 1931 he accepted the chair of physiology at the Fuad I University, Cairo, in succession to Prof W. H. Wilson, and remained there until a short time before his death.

Anrep was an outstanding experimental physiologist of the classical type, imbibing his inspiration, through Pavlov and Starling, largely from the German school of Ludwig and his contemporaries His first loyalty was to 'Ivan Petrovitch', whom he revered and imitated largely, and to the land of his birth, the exile from which he greatly deplored. His second loyalty was to Starling, and to England, to both of which he owed so much. Perhaps a third was to Egypt, the deserts of which he explored with characteristic intrepidity and enthusiasm, having acquired a good knowledge of Arabic, and always having had a taste for adventure

His physiological work fell into two main categories in Russia, on the conditioned reflexes , and in England and Egypt, on circulatory problems. His first paper in the *Journal of Physiology*, in 1912, showed that the rise of blood pressure which followed when the splanchnic nerve was stimulated was in part due to the release of adrenaline. He was made a member of the Physiological Society in 1913, and contributed many papers to that and other journals, on such subjects as the coronary circulation, pancreatic and salivary secretion, the pulmonary circulation, cardiac reflexes, tissue histamine, and the peripheral circulation.

All his work was technically first-class , he had a terrifying capacity for work, was a quick and skilful, but rather temperamental, operator, and had a great knowledge of the literature of his subject

As a person, Anrep was engaging, buoyant, dynamic, with quick enthusiasms and Slav introspectiveness , and, on occasion, as when an experiment failed, he was capable of acute self-depreciation. He had great gifts as a raconteur and as a lecturer of an unusual type. He was a keen collector of apparatus and of postage stamps

He had one son by his first wife, Olga , by subsequent marriages no issue. C. LOVATT EVANS

Mr A. S. Ramsey

ARTHUR STANLEY RAMSEY, senior Fellow of Magdalene College, Cambridge, died at Cambridge on December 31

He was born at Hackney in 1867, the eldest son of the Rev. Averell Ramsey, a well-known Congregational minister. He was educated at Batley Grammar School and Magdalene College, Cambridge, where he graduated fifth wrangler in 1889 After seven years as mathematics master at Fettes College, he returned to Magdalene in 1897 as Fellow and lecturer in mathematics, and held the latter post until his retirement from active teaching in 1934. When the office of University lecturer was instituted in 1926, Ramsey was one of the first to be appointed, and he continued in office until his retirement under the age limit in 1932.

Ramsey would have been the first to disclaim originality in his contributions to mathematics His great gift was as a teacher, particularly of applied mathematics, and he had an especial understanding of the needs of the average student. He soon realized that there was a great lack of systematic text-books adapted to the course of study, and he set himself with indefatigable industry to fill this gap. In the course of years a truly remarkable series of text-books flowed from his pen. His published works are "Modern Plane Geometry" (Richardson and Ramsey), "Hydromechanics" (Besant and Ramsey), "Hydrodynamics", "Elementary Geometrical Optics", "Dynamics" "Statics", "Hydrostatics", "Electricity and Magnetism" , and "Introduction to Newtonian Attraction" All these books are marked by clear thinking, orderly presentation and a wealth of illustrative examples, and most of them, despite great developments in mathematical theory and method, have maintained a steady and deserved popularity His lectures were equally clear and systematic, and, in private teaching, there were few questions to which he would not at once produce the answer from among his carefully filed manuscript notes.

In addition to his mathematical work, Ramsey took a very active part in college and university administration. He was successively bursar, tutor and president (that is, vice-master) of Magdalene, and he was a member of the Financial Board of the University of Cambridge for more than twenty years. He had a special interest in religious matters and particularly in the affairs of the Congregational Churches He was for many years a member of the Council of the Congregational Union of England and Wales, and gave very valuable help to Cheshunt College, Cambridge, as a governor and for nine years as chairman of the governors

Ramsey was a man of uncompromising integrity, and he was possessed by a tremendous sense of duty Though he could be formidable indeed in his condemnation of the culpably second-rate, kindliness was never far absent, and in his later years it was his dominant characteristic. In his retirement he could be relied upon to delight his listeners with a seemingly inexhaustible fund of reminiscence, told with inimitable humour. He made a lasting impact upon the life of his College, and both there and elsewhere he will long be remembered as a teacher and as a wise friend. His private life was clouded by two great tragedies, stoically endured His wife, whom he had married in 1902, lost her life in a motor-car accident in 1927, and three years later came the lamentably early death of his elder son, the brilliant F. P Ramsey, Fellow of King's and author of "Foundations of Mathematics". He is survived by his younger son, A. M. Ramsey, Bishop of Durham, and by two daughters D W BABBAGE

Mr. Edwin Grey

ONE of the last links with the Rothamsted of Lawes and Gilbert's time was broken when Edwin Grey died on January 30 at the age of ninety-five. Young Ted Grey went to the Rothamsted Laboratories in 1872 when he was thirteen years old, and with other boys was trained to carry out the botanical analysis of the hays from the Park Grass plots He was soon marked out as a careful and reliable worker, and as time went on he took part in the classical experiments on soil fertility and animal feeding of the second half of Gilbert's reign. For many years Grey was field superintendent in charge of the famous field plots, and never were they better cared for.

Outside his work Grey entered into the social life of the village and Laboratories with great zest, and his unusually clear memory of scenes and dialogue enabled him to record, in his later years, the human story of the Laboratory and its surroundings in two most readable books. One of these, "Reminiscences of the Rothamsted Laboratories, Staff, and Experimental Fields", gives a striking and vivid picture of the original Rothamsted and its great and also its humbler personalities. The other, "Cottage Life in Hertfordshire Village", portrays in almost photographic detail the daily lives and customs of a smal rural community in the last quarter of the nineteent century.

On his retirement in 1922 after fifty years service Edwin Grey was presented with an address bearing many of the best known names in agriculture. He maintained his interest in Rothamsted affairs for the rest of his long life. Seldom did one visit him withou coming away with some interesting sidelight on the Rothamsted story. He was the last survivor of the old order.

H. V. Garner

NEWS and VIEWS

University College of Rhodesia and Nyasaland

The announcement was made on February 15 that H.M. the Queen has, by order in Council dated February 10, approved a grant of a Royal Charter to the University College of Rhodesia and Nyasaland. The Federal Prime Minister, the Right Honourable Sir Godfrey Huggins, was present at the Council. Furthermore, H.M. Queen Elizabeth, the Queen Mother, has accepted the office of president of the College. As we recorded more than eighteen months ago (*Nature*, 172, 1, 1953), the Carr-Saunders Commission on Higher Education for Africans in Central Africa recommended that the College in which it was interested should be granted complete autonomy and that it should be established by Royal Charter. The news that this has now been done will be pleasing to all who wish well of the experiment now being made in higher education in Central Africa. Reference has been made to this experiment in these columns from time to time (see *Nature*, January 29, p. 181), and the granting of a Royal Charter to the new university institution is indeed welcome. The news that Queen Elizabeth, the Queen Mother, who laid the foundation stone of the College during her visit to Central Africa in 1953, has agreed to become the first president of the College will also be received with pleasure. It is one more indication of the serious interest which the Royal Family takes in university education.

University College of the West Indies

The Jamaica Sugar Manufacturers' Association is to make a contribution to the funds of the University College of the West Indies in response to an appeal made by the Chancellor, Princess Alice, Countess of Athlone. The gift will take the form of 8*d*. a ton on all 'quota sugar' sold during the next seven years. Over this period, the contribution is expected to amount to £75,000. Caroni Ltd., Trinidad, the British Guiana sugar producers and the West India Sugar Company are also to respond to the appeal.

International Conference on the Peaceful Uses of Atomic Energy

Dr. H. J. Bhabha, director of the Tata Institute of Fundamental Research, Bombay, and chairman of the Indian Atomic Energy Commission, will be president of the United Nations Conference on the peaceful uses of atomic energy which opens in Geneva on August 8. Prof. Walter G. Whitman, head of the Department of Chemical Engineering at the Massachusetts Institute of Technology, will be secretary-general of the conference. In this capacity, Prof Whitman will serve as an officer of the U.N. Secretariat, and he will be assisted by a three-man U.N. working party consisting of Ralph J. Bunche and Ilya S. Tchernychev (U.N. Under-Secretaries), and Dr. Gunnar Randers (special consultant to th Secretary-General, Dag Hammarskjold, in matter relating to the conference). Eighty-four countrie have been invited to attend the conference. Mr. Hammarskjold said the nominations were made in accordance with the views of the seven-nation advisory committee drawing up plans for the conference. He will appoint six vice-presidents from nominees to be designated by Brazil, Canada, France the Soviet Union, the United Kingdom and the United States, which with India constitute the advisory committee; India is, of course, providing the president. There will also be a chairman and a *rapporteur* for each of the sections into which the conference will be divided for working purposes. These officers will be appointed by the Secretary-General before the conference opens. They will be selected from scientists eminent in the relevant fields and equitable geographical distribution will be taken into account.

After a preliminary address by Dr. Bhabha the conference will open by considering the world' estimated power requirements in some fifty year time, in order to set the stage for discussion o the effect of nuclear energy on the world powe problem. The agenda is divided into the following main subjects: need for a new power source; the role of nuclear energy; the building of a nuclea energy enterprise; health and safety aspects o nuclear energy; production and use of isotopes; problems relating to large quantities of radioactive substances. These will be considered in plenary session. In addition, section meetings will be held on such topics as reactors, biological and medical questions, and the application of isotopes to research and industrial problems. All subjects must be dealt with and presented only from the scientific and technical points of view. Papers must reach the Secretary-General not later than July 1; their titles, accompanied by an abstract not exceeding 500 words, should be submitted by May 15. Each country and specialized agency attending may send up to five representatives including, to the extent possible, individual experts competent in the atomic energy field; they may be accompanied by as many advisers as necessary. All meetings will be held in public, and will be interpreted in four languages

English, French, Russian and Spanish. As the conference will last only twelve working days, there will not be time for all papers to be presented orally. The choice of those to be read to the conference, in full or in part, will be made by a panel of qualified scientists to be designated by Mr. Hammarskjold on the advice of the advisory committee. Papers which are not presented orally will still be considered part of the conference, and will be included in its published proceedings.

Public School and Grammar School Boys for Industry

FOLLOWING the pamphlets recently issued on careers for university graduates in industry and directing the attention of industry in Britain to the growing importance of the universities as a recruiting ground for the ablest talent in each generation of school-leavers (see also p. 313), the Education Committee of the Federation of British Industries has now prepared a further pamphlet on the recruitment and training of the public school and grammar school boys in industry (pp. 12. Fed. of British Industries, London, 1954. 1*s*.) The pamphlet suggests that industry is in danger of neglecting an important source of managerial talent, and it makes detailed proposals as to the way in which firms able to offer posts suitable for public school and grammar school boys could summarize information regarding such posts and training on a standard index card for distribution to the appropriate schools. This distribution could be made direct to any schools with which the firm has already established contact, or with the co-operation of the Central Youth Employment Executive and the Public Schools Appointments Bureau.

The pamphlet points out that educational changes since the Second World War have led to many more grammar school boys in Britain remaining at school until they are seventeen or eighteen, while to-day 17 per cent of the total number of boys in the secondary schools are educated in grammar schools compared with 11.5 per cent in 1938. The selection procedure appears to be reasonably effective and, broadly speaking, the best intellectual talent in the secondary schools of England and Wales is to be found in the grammar schools, and, in Scotland, in the senior secondary school. Accordingly, industry can no longer count on recruiting from the elementary school leavers a sufficient number of those possessing the intellectual capacity and character demanded of foremen, departmental superintendents, managers or directors. Since at present 18 per cent of grammar school boys leave at 15, 48 per cent at 16, and 34 per cent between 17 and 19, there is still a large proportion of them, and of public school boys, available for recruitment at an age when industry is in direct competition with the Civil Service and other professions. Schoolmasters, in general, are probably less familiar with the prospects in industry, and the pamphlet is designed to dispel lack of knowledge which is leading industry to misuse valuable recruits.

Metallurgical Developments at Swansea

METALLURGY is an applied science, and in the words of Prof. R. Mehl is "a composite of learning and of abilities-to-do". As a university subject, like medicine, it is based on the pure sciences, which form the main part of the curriculum in the intermediate and subsidiary years. The reduction of metal from ore has been receiving a great deal of scientific study, but it is felt that the manipulation and utilization of the reduced metal itself requires increased attention' and in the widest field. Metallic parts for modern structures frequently involve expensive engineering operations, but by the co-operation of the metallurgist, the engineer and the physicist, metallurgical short-cuts may be provided. A scientific study of fabrication processes on a suitable scale may cure existing troubles and lead to improved techniques. This involves a type of physical metallurgy which can be called 'fabrication metallurgy'. It would cover welding and joining, precision casting, extrusion, powder metallurgy and mechanical deformation. The Steel Company of Wales and Richard Thomas and Baldwin, Ltd., have together made a munificent gift, totalling £100,000, to the University College of Swansea to develop work along these lines. Certain portions of the existing courses will be amplified, and students may be able to select alternative lines of study in their last year. The introduction of post-graduate courses is being considered. Laboratory extensions are in hand and research fellowships are contemplated. A professor of physical metallurgy will be appointed within the existing Department, to deal with the teaching and research which this development involves.

Charles Blachford Mansfield (1819–55)

A PIONEER in the aniline industry, Charles Blachford Mansfield, died one hundred years ago on February 26, 1855, a martyr to science. He was born at Rowner in Hampshire on May 8, 1819, and was educated at Winchester and Cambridge, where he took his B.A. degree in 1846. At the newly founded Royal College of Chemistry in London he became the favourite pupil of the superintendent, August Wilhelm von Hofmann, under whose direction he found coal-tar naphtha to be an abundant source of benzene. Benzene had lately been found in coal-tar and named by von Hofmann. By freezing a carefully fractioned sample of coal-tar naphtha, Mansfield in 1849 obtained with the aid of simple dephlegmators a pure benzene distilling below 100° C. which was a prerequisite for the aniline industry. In a pamphlet, "Benzol, its Nature and Utility", he mentioned that a peculiarly brilliant light could be produced by charging air with its vapour. During the 1849 cholera epidemic he advocated a pure water supply for Bermondsey and other districts. Interested in aeronautics, he wrote a book on "Aerial Navigation", which contained a number of remarkable forecasts. In his lectures on the chemistry of metals, delivered at the Royal Institution in 1851–52, he attempted a classification of his own devising. In 1852 he visited Paraguay and drew up a scheme for the colonization of the Gran Chaco. He pointed out the wastage of beef and other animal matter, which could be used for making ammonia or saltpetre, and suggested that the vast stores of timber wasted might be turned into huge unsinkable rafts across the Atlantic. Mansfield's chief contribution to theoretical chemistry was his "Theory of Salts", published in 1855. He was engaged in preparing samples of benzene for the Paris Exhibition, when on February 17, 1855, a naphtha-still in his laboratory at St. John's Wood overflowed. Severely burned, he died nine days later at the Middlesex Hospital, at the early age of thirty-six.

Catalogue of Optical Instruments

NEW illustrated editions have recently been issued of Sections *D* and *M* of the "Hilger General Catalogue" (obtainable from the Hilger Division, Hilger and Watts, Ltd, 98 St Pancras Way, London, N.W 1) Section *D* deals with monochromators for ultra-violet, infra-red and visible radiation and with wave-length spectrometers and specialized spectroscopes, and mention is made of a new series of monochromators, now in the final stages of design, which are planned to replace the former Muller–Hilger Uvisor instruments. Section *M* deals with a wide range of apparatus, including refractometers, polarimeters, temperature regulators, strain viewers, and photoelastic and electrophoresis apparatus Two types of temperature-regulating devices for optical instruments fitted with water jackets are offered For precise measurements the B.T L thermostatic water circulator made by Baird and Tatlock (London), Ltd, and designed in conjunction with the Hilger Division of Hilger and Watts, Ltd., is recommended, and for less critical work the Gallenkamp water heater, which is well suited for the Abbe type of refractometer Other refractometers described are the Hilger–Chance refractometer for solids and liquids, the Rayleigh interference refractometer for gases or for liquids, and a thin-film ultra-violet refractometer for liquids

National Institute of Agricultural Botany

The work of the National Institute of Agricultural Botany during the past year is reviewed in its *Journal* (7, No. 1, 1954) This number includes an account of the oldest regional trials centre, the Norfolk Agricultural Station, and in various ways indicates the many sides of the Institute's work, including reports of trials, classifications of varieties, methods of assessing premature germination (that is, 'sprouting') in wheat, and a further report from St. Albans on quality of oats This latter paper describes an interesting investigation into decayed kernels. There is also a full report on the crop conference held in December 1953 The proceedings were of general interest, and the emphasis on quality is of topical importance It was probably the first occasion when growers' representatives of so many areas have been able to meet millers and bakers, maltsters and brewers, for a full discussion of their different points of view

Fifteenth International Congress of Zoology, London, 1958

The Fifteenth International Congress of Zoology is to be held during July 16–23, 1958, and will meet in the Imperial College of Science and Technology, London The president is Sir Gavin de Beer, director of the British Museum (Natural History), secretary-general, Prof H R Hewer (Imperial College, London, S.W 7), assistant secretary-general, Dr. G. E Newell (Queen Mary College, London, E 1) In preparation for the work on zoological nomenclature by the Congress, arrangements will be made by the International Trust for Zoological Nomenclature in conjunction with the secretariat of the Congress for a colloquium on zoological nomenclature to be held immediately before the Congress, to start on July 7. The task of the colloquium will be to examine in detail the draft text of the *Règles* as amended by the Paris and Copenhagen Congresses, prior to their submission to the Congress for adoption Formal invitations to attend the Congress will be issued in September 1957 All communications meanwhile should be sent to the Secretary-General at the above address

Royal Astronomical Society Officers for 1955–56

The following have been elected officers for 1955–56 of the Royal Astronomical Society *President*, Sir Harold Jeffreys, *Vice-Presidents*, Dr J Jackson, Prof. A C B Lovell, Dr R A. Lyttleton (*geophysical secretary*), and Prof H H Plaskett, *Treasurer*, Prof L M Milne-Thomson, *Secretaries*, Prof C W Allen and Dr A Hunter, *Foreign Secretary*, Sir Harold Spencer Jones, *Council*, Dr A Armitage, Dr D E Blackwell, Prof. H. Bondi, Mrs E. M Burbidge, Mr E H Collinson, Prof. V C A. Ferraro, Mr T Gold, Dr R W. B Pearse, Dr J G Porter, Dr S. K Runcorn, Mr. D H Sadler and Dr P A Sweet

Announcements

H R H. The Duke of Edinburgh has been elected the first Honorary Fellow of the Pharmaceutical Society of Great Britain

President's Awards announced on Indian Republic Day (January 26) have been made to Prof V. R Khanolkar, director, Indian Cancer Research Institute, Bombay, India, and to Prof M. S. Thacker, director, Indian Institute of Science, Bangalore, India

Mr W S Bisat, a well-known civil engineer of Leeds and Fellow of the Royal Society, has been awarded the Liverpool Geological Society Medal in recognition of his work on goniatite faunas and their use in the subdivision of the Carboniferous in the North of England

Mr R H Gummer, a director of International Combustion, Ltd, and associated companies, has been elected president of the Institute of Fuel, in succession to Dr W Idris Jones, director-general of research to the National Coal Board. Mr Gummer is a founder-member of the Institute, and is well known for engineering activities connected with fuel

Dr. C J. Gadd, keeper of Egyptian and Assyrian antiquities at the British Museum, has been appointed to the University of London chair of ancient Semitic languages and civilizations tenable at the School of Oriental and African Studies The title of reader in agronomy in the University of London has been conferred on Mr A G Davis in respect of the post held by him at Wye College

The fourteenth International Horticultural Congress will be held at Scheveningen, Holland, during August 29–September 6 Further information can be obtained from the Honorary Secretary, International Horticultural Congress, Ministry of Agriculture Bezuidenhout 30, The Hague.

The first International Congress on Documentation of Applied Chemistry will be held in London during November 23–25 Further information can be obtained from the Honorary Secretary, International Congress on Documentation of Applied Chemistry 56 Victoria Street, London, S W.1.

A conference on "Low Temperature Physics" will be held under the joint auspices of the International Union of Pure and Applied Physics and Commission I of the Institut International du Froid as part of the four-yearly International Congress of Refrigeration which commences at the Sorbonne Paris, on August 31 The first sessions will be mainly devoted to the applied aspects of low-temperature physics, those concerned mainly with pure physics will begin on September 2 The proceedings will end on September 8 Further information can be obtained from Prof L Weil, Institut Fourier, Place du Doyen Gosse, Grenoble, Isère.

EARLY SCHOOL LEAVING

AN inquiry into the factors influencing the age at which children leave school, and the steps desirable to increase the number of those who stay after the age of fifteen, has been completed by the Central Advisory Council for Education (England). The Council's findings and recommendations have been published in a report, "Early Leaving" (H.M.S.O., 1954. 3s. 6d. net) (see also p. 313).

A comprehensive study was made of the number of leavers at various ages, something of their background, school records, motives and subsequent careers. For this purpose, a 10 per cent sample was taken of maintained and direct-grant grammar schools in England.

The heads of 114 schools completed a questionnaire giving as much information as possible on these lines in respect of each boy and girl who entered school with the intake of September 1946. In addition, evidence was secured from boys and girls themselves, through youth clubs and certain groups of national servicemen.

One of the most important factors influencing the age at which boys and girls leave school was found to be the home background. Professional and managerial families' children accounted for only 15 per cent of the child population, but represented 25 per cent of the grammar school population and 43.7 per cent of the sixth-form complement.

School records of children in different social groups were studied, and it was found that from children of parents in professional or managerial occupations at one extreme to the children of unskilled workers at the other there is a steady and marked decline in performance at the grammar school, in the length of school life, and in academic promise at the time of leaving. This is not a mere development of the better performance at the age of eleven of children in certain groups; it reflects a widespread changing of places in academic order between eleven and sixteen or eighteen years of age.

Shortage of money in itself is a less-common reason for leaving than some others—overcrowding in the home and "different social assumptions" are important considerations. The handicap of adverse home conditions, moreover, tends to increase throughout the school course and falsify many of the predictions made in the process of selection.

To meet the problem raised by unsuitable home conditions, the report recommends investigation and possible help by an appropriate social agency such as the school health service, provision of boarding facilities by local education authorities, and concessions by schools and education authorities, such as keeping the public libraries open until 9 p.m., keeping schools open after normal hours, in country areas the opening of primary school premises in the evening, and more generous assistance to youth clubs which cater especially for grammar school pupils.

Boys tend to stay longer at school than girls and do rather better academically. Evidence confirms the common belief that many parents attach more importance to their sons' education than to that of their daughters.

The Council found that while there has been a continued and marked tendency towards a longer school life since the War, there was a very large number of boys and girls leaving at fifteen who would do well to stay on at school for another year. The value of a school life extending beyond sixteen depends on the character, and especially the intellectual ability, of the particular child.

From the grammar school intake of 1946, in addition to about 10,000 boys and 7,000 girls who took advanced sixth-form courses, there were about 5,000 boys and 5,000 girls who had the capacity to do so if they had stayed longer at school. Of these, about 2,900 boys and 1,300 girls would have been suitable for courses in science or mathematics. There is a great national need for scientists of many kinds; all the scientists of good quality that the schools can produce will be absorbed if the universities and technical colleges can expand their scientific intake. The problem remains of providing the necessary scientific staff for the schools; but if this can be solved, the 4,200 potential scientists out of the additional 10,000 boys and girls who could well take advanced courses should have no difficulty in finding suitable occupations. It is acknowledged that "some of those who have the intellectual capacity for sixth form work may be right to leave without undertaking it"; but if pupils capable of taking advanced courses can be persuaded to stay at school they will be serving both the community and themselves.

The Council recommends that, in drawing up building programmes, local education authorities should estimate generously the need for grammar school places to allow both for an expansion in the size of their intake and also for an increased proportion in the fifth and sixth forms.

The process of selection for secondary education should allow for a small number of grammar school places to be filled at each individual school by alternative methods; more transfers from modern to grammar schools, even after the age of fifteen, should be made.

Local education authorities should review the circumstances in which children leave school early for financial reasons, and adjust their schemes of aid accordingly.

Drastic revision of the less-generous scales, provision of higher grants for older children, generous allowances in respect of further dependent children, and consideration of the use of scales based on net rather than gross income, are the main suggested needs. The Council also believes that the law should be amended to provide for the payment of family allowances for children still at school up to any age. At present such allowances cease when the child reaches the age of sixteen.

A number of recommendations are made for the consideration of employers, trade unions and professional bodies. Many young people, especially boys, leave school early in order to get a job. Conditions of entry to many professions and trades do not encourage a longer school life; craft apprenticeship schemes influence boys to leave school at not later than sixteen. The possibility of reducing the length of craft apprenticeship for boys who have stayed at school for a full five-year course should be considered, and the number of student apprenticeships increased, terms of admission to the professions should provide a greater incentive to pupils to reach sixth form standard In clerical and office careers, there should be a more effective system of grading linked with minimum ages of entry and differential scales of pay

The report also makes suggestions for administrative action within the schools These include treating the whole work of the school, including the sixth form, as continuous, and introducing some transition to sixth-form ways of working earlier in the school course, providing more science facilities for girls and experimenting more widely in such courses for boys, providing comparable courses for pupils of similar ability in grammar and modern schools, maintaining regular personal contact with the home and increased co-operation with the Youth Employment Service and employers

T H HAWKINS

CENTENARY OF ALUMINIUM

DURING June 1–11, at the Royal Festival Hall, London, the aluminium industry is presenting a Progress Exhibition, not only to mark the centenary of aluminium as a commercial metal but also to demonstrate how the present vast output and unique experience already gained are now being applied to every great industry in increasing measure It was at the Paris Exposition in 1855 that the French scientist, Prof St Claire Deville, who had succeeded in extracting aluminium from clay by a chemical process, exhibited samples of the metal Aluminium was rated a precious metal, since it cost £60 per pound to produce The first article to be made of the new metal was a rattle for the child of the Emperor Napoleon III, who ordered aluminium cutlery to replace the gold plate at the Tuileries banquets An aluminium watch-chain was also presented to the King of Siam, when on a State visit to France Attracted by its light weight, the Emperor commissioned Deville to produce aluminium on a large scale so that, with its cost reduced, it could be used for equipment for his soldiers However, only ten tons of aluminium were produced in the whole world in the next ten years, its lowest price being £3 per lb

In 1886, Charles Martin Hall in the United States and Paul Heroult in France, working independently, simultaneously patented the electrolytic process for extracting aluminium from its oxide To-day, using basically that same method of extraction, 30,000 tons of pure aluminium are produced in Britain alone, at the great hydro-electric plant in the Scottish Highlands, and world production in 1954 has probably exceeded three million tons and is still increasing From £144,400 per ton its price is now £165 per ton, and aluminium has the distinction of having increased in price to a less extent than any other important commodity In 1907 came the discovery by a German scientist, Alfred Wilm, that by alloying small quantities of other metals with aluminium, its strength could be greatly increased Further research and development in Britain produced a wide range of alloys which made possible the development of the aircraft industry and of the internal combustion engine

The ten years that have followed the Second World War have been years of remarkable progress when research results have been applied to problems in every industry First came the aluminium prefabricated house, 70,000 of which were built, to be followed by the adoption of aluminium in permanent building construction In shipbuilding its success was never more strikingly demonstrated than by the great American liner *United States*, which has more than two thousand tons of aluminium in her superstructure, lifeboats and many fitments, less spectacular applications of aluminium to ships had already become a commonplace in Britain The world's first aluminium bridges have been built in Britain, and aluminium coaches of London's Underground trains, and aluminium bus bodies on London's streets, provide ample evidence of the faith of the engineer in aluminium.

Its light weight and its resistance to corrosion, symbolized by Gilbert's famous aluminium statue of 'Eros'—now more than sixty years old—have made this the 'Light Metal Age' If the progress, especially in the past ten years, has been remarkable it is still only a beginning, for the future of aluminium is boundless in its possibilities

THE VICUNA

IN a recent issue of *Oryx*, Dr G Dennler de la Tour has described the characteristics, habitat and behaviour of the vicuna (11, No 6, December 1954)

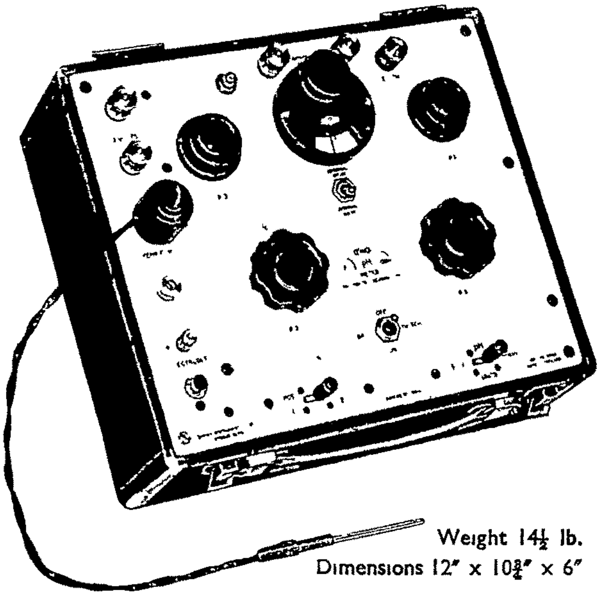
In form the vicuna resembles the guanaco, but it is smaller and slenderer Its colour varies from pale fawn, through vermilion and golden to strongly fulvous. The vicuna has no black on its face, as has the guanaco From the throat to the knees there is a pure white tuft, the belly and inner sides of the limbs being white also The vicuna stands 28–35 in high at the shoulder, its average size decreasing from south to north in its South American range Its wool is shorter but much finer than that of the guanaco and is probably the finest and lightest wool in the world. Vicunas are found in small droves of five to fifteen females led by an adult male which watches over the flock Young males are expelled from the flock by their mothers when they are eight to ten months old and unite into herds of from twenty to a hundred or more

The mating season lies between April and June and, as the gestation period is ten months, parturition occurs between January and March The vicuna almost always produces one offspring, in confinement it does not breed readily

Vicunas feed on grasses of *Poa*, *Bromus*, *Agrostis* *Stipa*, and other alpine genera They drink only every two days and always use the same track to water

The vicuna, generally speaking, lives at higher altitudes than the guanaco It enjoys humid meadows which lie adjacent to the eternal-snow summits of the Andes, many of which reach and pass the 6,000 metre mark

Vicunas occur in the high plateaux of the Andes between 3° S and 30° S, that is, in the extreme south of Ecuador, in Peru and Bolivia, in the extreme north of Chile and in north-western Argentina Their southern limit is in Argentina at about the Agua Negra River, while their Chilean range does not go so far southwards Where man has advanced with his sheep and goats, alpaca and lama breeding



DORAN

UNIVERSAL pH METER

CAT No M4982

This precision instrument embodies almost every possible feature considered desirable in a modern pH Meter. In addition to high accuracy it provides utmost simplicity in adjustment and reading together with reliable automatic temperature compensation. The electrometer valve employed has remarkable stability, negligible grid current and very low current consumption.

Specification·

Ranges
0-14 pH units and 1,400-0-1,400 millivolts.
Accuracy
1 millivolt and 0.01 pH unit.
Batteries
External 2 (or 1.5) volt; internal 15 volts
Consumption
External 50 mA; Internal 0.5 mA.
Supplied in teak or laminated bakelite case.

Weight 14¼ lb.
Dimensions 12" x 10¾" x 6"

Further details are given in our List 109A

Variational Principles in Dynamics and Quantum Theory

• •

By WOLFGANG YOURGRAU, Dr Phil.
and STANLEY MANDELSTAM,
B Sc (Eng), B.Sc (Rand)

In this book, the authors deal with the mathematical foundations of Variational Principles and those sections of dynamics (such as the Hamilton-Jacobi theory) to which they are related. The principle of least action is analysed also from a historical viewpoint, while an evaluation is attempted of the conflicting philosophical conclusions which eminent scientists have reached on this subject. Allied topics discussed include an examination of the role of Variational Principles in the development of quantum mechanics, as well as the application of Hamiltonian methods to electrodynamics. 25/- net

ANALYSIS OF DEVELOPMENT

BENJAMIN H WILLIER
(Professor of Zoology, Johns Hopkins)

PAUL A WEISS
(Member Rockefeller Institute for Medical Research)

VIKTOR HAMBURGER
(Professor of Zoology, Washington University)

735 pages 248 figures 105s.

A work of great distinction which presents a summary of the present state of knowledge, and problems under investigation, of the stages in the embryological development of animal organisms. Each chapter is written by a specialist with the editorial supervision of three eminent embryologists

CONTENTS

1. Problems, Concepts and Their History
2. Methods and Techniques
3. Cellular Structure and Activity.
4. Nucleus & Cytoplasm in Development.
5. Embryogenesis Preparatory Phases
6. Embryogenesis : Progressive Differentiation
7. Special Vertebrate Organogenesis
8. Energy Exchange & Enzyme Development.
9. Ontogeny of Immunological Properties.
10. Ontogeny of Endocrine Correlation
11. Determination of Size
12. Metamorphosis
13. Regeneration
14. Teratogenesis.

A work of great importance and of outstanding authority It is of great special interest to embryologists and of considerable general interest to all biologists of whatever category

MACMILLAN BOOKS

Advanced Level Examples in Physics

R V. JOHNS, M A , B Sc

Lecturer in Physics and Mathematics, City of Liverpool College of Technology

W. F. WARE, B Sc , A.Inst P

Senior Physics Master, Cathays High School for Boys, Cardiff

This book of numerical examples is designed to supplement the theoretical and laboratory work of students preparing for examinations in Physics at the Advanced level of the General Certificate of Education and for Intermediate Degree examinations Some 1,000 examples have been arranged by topics and carefully graded in difficulty. Contents are arranged under the headings Mechanics and Properties of Matter, Heat, Light, Sound, and Magnetism and Electricity 16*s*

A Text-book of Electricity and Magnetism

G R. NOAKES, M A , F Inst.P.

This is the new, Third Edition of a book which will meet the need of those taking Intermediate degree courses and the Advanced and Scholarship Examinations of the General Certificate of Education All the usual topics required at this stage are dealt with, and where necessary calculus is used Among the special topics discussed are the conduction of electricity through gases, atomic physics and modern views on ferro- and terrestrial magnetism *Third Edition* 14*s*

Semimicro Qualitative Analysis

A Course in Applied Chemical Equilibrium

EDWIN O. WIIG, Ph D , WILLARD R LINE, Ph.D , and JOHN F FLAGG, Ph D

This revision of *Semimicro Qualitative Analysis*, while retaining the experimental procedures and much of the form of the earlier text, has been almost completely rewritten The theoretical section has been considerably expanded and a large number of problems of varying difficulty (with the answers to many of them) have been added The sections on special procedures for ferro- and high-aluminium alloys have been modified on the basis of student experience. 25*s.*

Science and its Background

H D. ANTHONY, M A.(Cantab), B Sc , Ph D (Lond), F R A.S

Here is the story of science, with the background of history in which that story is set Although most of the chapters centre around individual men of science whose work is of value to day, the historical background is not only that of isolated biography but the continuous history of human affairs Two chapters, on post-war developments and the pursuit of science for its own sake, have been added for this second edition. *Second Edition* 20*s*

Inorganic chemistry is to-day a lively and developing subject. There ar advances in many fields, but perhaps the greatest stimulus has com from nuclear science, with its need for knowledge of thorium, uraniu and the transuranium elements, of the fission products, of poor neutro absorbers and indeed of every element in the periodic table.

The Journal will publish original research papers, both experimenta and theoretical The boundary between this and other branches o chemistry may not always be easy to define, but the emphasis will b primarily on inorganic chemistry.

Contents of the first number (March 1955):

- RICHARD A GLASS, STANLEY G. THOMPSON and GLENN T. SEABORG: Nuclea thermodynamics of the heaviest elements
- D. J M. BEVAN: Ordered intermediate phases in the system CeO_2—Ce_2O_3.
- R. W M D'EYE and P. G. SELLMAN· The thermal decomposition of thorium oxalat
- EUGENE G ROCHOW and HUGH G. LECLAIR: On the molecular structure o methyl silicone.
- CHARLES D CORYELL and RICHARD C. FIX· The Hammett acidity function H_0 i H_2SO_4-SO_3 mixtures.
- G. JANDER and H KLAUS: Über elektrometrische Titrationen in wasserfrei Essigsaure
- W. F. LIBBY and HARO V. BUTTLAR: Natural distribution of cosmic ray produce tritium II
- F. G. A STONE and DIETMAR SEYFERTH. The chemistry of silicon involvin probable use of *d*-type orbitals
- H. C LONGUET-HIGGINS and D A. BROWN. The dynamics of binary hydride
- L. E. GLENDENIN and E P STEINBERG. Fission yields in spontaneous fission of Cf^{25}
- J SUTTON: Hydrolyse de l'ion uranyle et formation d'uranates de sodium.
- G N WALTON and I. F. CROALL Chemical effects in fission product recoil.
- F. ROSSOTTI· The homogeneous exchange reaction between monovalent an trivalent thallium
- J. G CUNINGHAME, J. EAKINS, E. R. MERCER, M. L SIZELAND and H. H WILL The rapid separation of rare earth fission products by cation exchange, usi lactic acid eluant.

There are two subscription rates, A and B, details of which are as follows:

Subscription A—the normal subscription rate of £4 10s ($12 60) per volun including postage, for libraries, research departments, firms, Government offi and similar organisations,

Subscription B—a special concessionary rate of £3 10s ($9.80) per volume includi postage, for private individuals only, who will be asked to complete a certific to the effect that the journal is for their personal use.

NTRODUCTION TO

Process Control System Design

. *J. YOUNG, B A , B Sc*

This is a straightforward explanation of the fundamentals of the subject, and the student or beginner is given a real understanding of the principles governing the operation of control systems. The author examines the basic principles in quantitative terms with emphasis on dynamic characteristics, and he uses plain English and only the simplest mathematics.

This is an important book for everybody concerned with plant design For the instrument technologist, for the chemical engineer; for physicists, engineers and chemists; and it is written by a leading expert in the field. Mr. Young is Head of the Central Instrument Laboratory of Imperial Chemical Industries. Illustrated, **42s.** net, April

An Introduction to Botany. *THIRD EDITION*

. H. PRIESTLEY, D S O , B Sc , F L S , and LORNA I. SCOTT, M Sc , F L S

This book, designed for first-year students, has been revised throughout and in many places, particularly the physiological sections, has been re-written. The course concentrates on the flowering plant, and life-cycle work is introduced mainly in its relation to the life-history of the angiosperm. In an endeavour to improve the teaching of plant anatomy, the authors have introduced, wherever possible, alternative techniques to enable the student to build up a three-dimensional picture of the reconstruction of the tissues in a way that is not possible by the use of sections alone. Illustrated, **30s.** net, July

Structural Analysis. *SECOND EDITION*

W. FISHER CASSIE, Ph D , M Inst C.E., F.R S E

Although most students can comprehend and appreciate the fundamental conceptions on which the Theory of Structures is based, many find difficulty in applying these principles to numerical problems. This book demonstrates how such application can best be made Each chapter shows, by a series of graded examples, how one particular method of analysis is employed The text is intended as a working guide, and each problem should not merely be read, but should be calculated afresh by the student. A few of the problems indicate the modifications required in practice, illustrating the shortened methods and approximate treatments which may be used in the analysis of complex frames. The book does not, however, consider the design of structures, and is intended for the student of theory The work is confined to statically indeterminate structures, and it is assumed that the reader has studied the theory of simple beams and frames, and is familiar with elementary integration.

Illustrated, **18s.** net

LARGE-SIZE
POROUS
FILTER TUBES
for dust recovery

In the recovery from gases of catalytic fines, of dust or of similar materials, Royal Doulton porous ceramic filters give outstanding performance.

Advantages include —

- Uniformity of pore size, pore distribution and permeability
- Good mechanical strength
- Suitability for operation over a wide range of temperatures
- Resistance to corrosion
- Ease of cleaning—with air, steam, water or chemicals

Royal Doulton porous ceramic filter tubes in various grades from 50 to 750 microns measured maximum pore size can be made in lengths up to 5 feet

Introduction to

NUCLEAR ENGINEERING

Richard Stephenson
Consulting Editor

This is the first book to bring together the many unique engineering problems encountered in the nuclear engineering field Its main purpose is to afford engineers, who are taking, or have completed, a standard engineering curriculum, with the engineering problems encountered in the engineering field It includes details concerning reactor theory, radiation shielding, reactor materials, reactor control, separation of stable isotopes, chemical processing of radioactive materials, remote handling equipment and special engineering problems. Numerous examples and problems are illustrated throughout and references to declassified reports show where more detailed information can be found

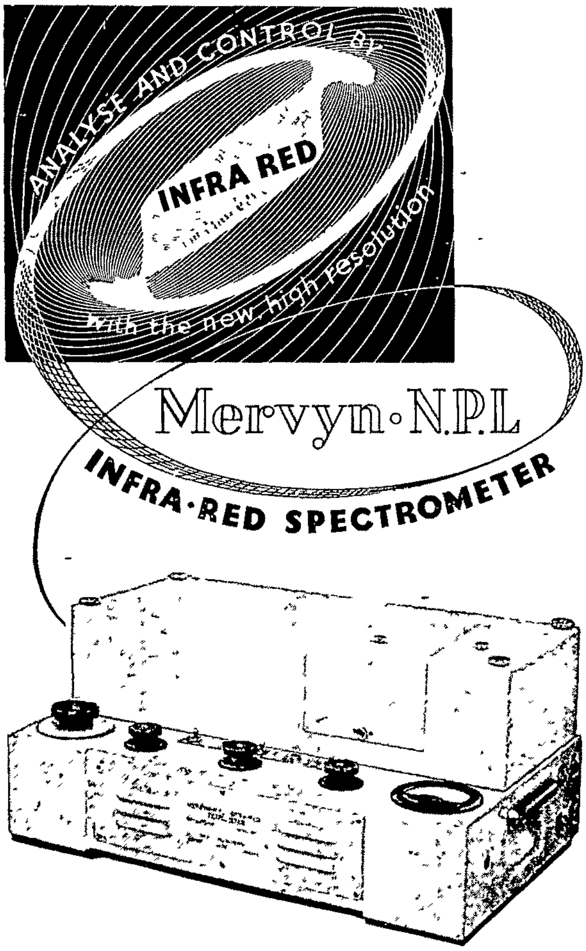
9 × 6 inches 500 pages 57*s* 6*d*

NUCLEAR PHYSICS

Alex E S Green
Associate Professor of Physics,
Florida University

The organisation and systematic treatment of this book have not previously been attempted at this level Until now such logical discussions of the foundations of nuclear physics have been confined to treatises addressed to specialists, research workers and advanced graduate students The subject is dealt with in a fashion appropriate to a vast field in an active state of change and development All major recent advances form part of the contents of NUCLEAR PHYSICS Topics such as the Wigner model, the collective model, the cloudy crystal ball model of nuclear scattering are discussed for the first time in a book of this kind

9 × 6 inches 475 pages 64*s* 6*d*



NOW—Infra-red analysis enters a new phase with the development of this Mervyn engineered instrument using Merton—N.P.L. diffraction gratings.

Here is the long awaited high resolution instrument for the 1 μ — 4 μ region. Of great stability, it reads percentage-transmissions direct.

USING A COMPLETELY NEW ELECTRONIC COMPENSATING SYSTEM

This versatile instrument is compact and simple to operate Has many applications in the manufacture of petroleum products, plastics, detergents, pharmaceuticals and other processes where the high cost of contemporary equipment has restricted the use of Infra-Red techniques

FOR pH CONTROL

JOHNSONS OF HENDON offer to chemists and manufacturers this useful series of five test papers for the measurement of pH values. UNIVERSAL is one paper covering completely the range from pH 1 to pH 10, enabling pH values to be checked to within 0.5 pH. COMPARATOR test papers make a set of four separate indicators for obtaining still greater accuracy by determining the pH value of any solution to within 0.3 pH.

Descriptive leaflet will be sent free on request.

JOHNSONS OF HENDON LTD.
LONDON, N W 4 ESTABLISHED 1743

THE phenomenal progress of recent years in electrical engineering owes much to the contemporary advances in the design of electrical measuring instruments.

The equipment of a laboratory for making electrical tests can involve an expenditure of hundreds of pounds Likewise the test gear essential to the work of the maintenance engineer can also be a source of considerable expense This difficulty is largely surmounted by using modern *multi-range* testing instruments, which afford maximum usefulness with reasonable initial outlay

"AVO" Instruments are the outcome of many years of successful experience by the pioneers and leading manufacturers of *multi-range* instruments Before leaving our factory, every "Avo" instrument is tested and adjusted to give a high degree of accuracy and constancy of performance

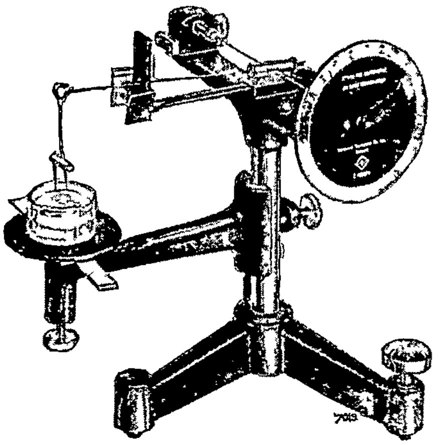
SURFACE TENSION APPARATUS

AND FOR **INTERFACIAL** SURFACES



Details are given in
SHEET No. 7-N.
May we send a copy ?

THIS apparatus is based upon the design by Dr. P. L. du Nouy, and is used for rapidly and accurately determining the surface tension, or the interfacial tension, of liquids. The method is simple, requires only a small quantity of the substance being tested, and is applicable to practically all kinds of liquids. The instrument is calibrated to read directly in dynes per cm.

and his mining, the vicuna has receded to higher altitudes

The vicuna was plentiful throughout its range in the era of the Inca Imperium. Hunting was only allowed every four or five years under official control, and only adult males were killed, the females being sheared and freed Under the Spanish Colonial regime, hunting was free and, according to reports, about 80,000 vicunas were killed each year in Peru and northern Chile, leading to a considerable decline in numbers After liberation from the Spaniards, the natives returned to the earlier practice of shearing and then freeing the animals Later the decline of the vicuna began again, for the export market demanded vicuna skins, vicuna robes and vicuna wool. The use of firearms destroyed whole flocks, the hunters taking advantage of the females' habit of remaining near the male after he was killed. Thus a whole drove could be slaughtered one after another, and, in this manner, thousands were killed. The wool output of one vicuna gives an average of 500 gm. The superstition that the bezoars (stomach-stones) have a medical and aphrodisiac value may have contributed to the practice of killing the animals, instead of just shearing them

It is difficult to estimate the number of vicunas living to-day In Peru the total number in 1940 was calculated at nearly a million, neither from Bolivia, Chile nor Ecuador has it been possible to get reliable data

Dr de la Tour doubts whether the total number of vicunas reaches a million, and estimates that it is probably not half a million

The first protection measures were carried out by the Inca Imperium when hunting was allowed only every four or five years and then under the strictest control Only the members of the Inca clan were allowed to wear clothes made of vicuna wool or use vicuna robes After liberation from Spain, Bolivar accorded protection to the vicuna by a decree in 1825 During the present century, Peru issued a decree in 1920 prohibiting the sale of vicuna skins and the making of goods from its wool, and Bolivia prohibited the export of vicuna skins

Argentina issued a decree in 1926 prohibiting the unting and exportation of vicunas as well as the ransportation and sale of their skin and fur

There is pressing need for joint action between all ive countries to see that existing laws are tightened ıp and carried out

A NEW IDENTIFICATION OF THE FLAME SPECTRA OF THE ALKALINE-EARTH METALS

By Dr C G JAMES and Dr T M SUGDEN

epartment of Physical Chemistry, University of Cambridge

THE characteristic flame spectra given by the alkaline-earth metals have been used extensively n analysis of these elements for many years, despite oubts as to their nature In the cases of calcium nd strontium they are made up predominantly of wo narrow regions for each metal, for calcium at 560-5470 A and 6400-6000 A, and for strontium t 6100-6000 A and 6900-6850 A They have been scribed tentatively to gaseous calcium oxide (CaO) and strontium oxide (SrO) respectively by Pearse and Gaydon[1], although other possible ascriptions have been made by King[2], and by Mahanti[3] Evidence to be given here supports strongly a new hypothesis —that they arise from the radicals CaOH and SrOH, and further that a considerable portion of the radiation in the green given by barium arises from BaOH.

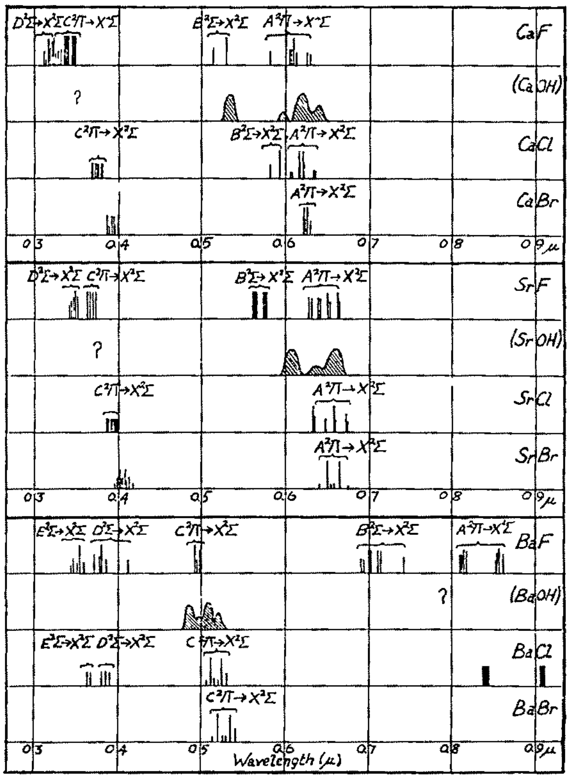

Fig 1 Diagrammatic spectra of the alkaline-earth halide radicals compared with the intense portions of the flame spectra of the alkaline earths

Fig 1 shows diagrammatically the main features of the spectra of the halide radicals of the type of CaF, as listed by Pearse and Gaydon, each system falling into a narrow region presumably because of similarity between the potential energy curves of the contributing states We have inserted between the fluoride and chloride in each case a diagram of the spectrum obtained from these elements in a hydrogen/air flame, using a photoelectric recording device of low resolution in conjunction with a Hilger *E*3 medium quartz spectrograph The correlation of the two regions of strong emission for calcium and strontium with those of the neighbouring halides ($A^2\Pi \rightarrow X^2\Sigma$ and $B^2\Sigma \rightarrow X^2\Sigma$) is very evident

In the case of barium, the corresponding transitions are in the infra-red, and have not been considered Flames containing barium, however, show a zone of diffuse structure, as depicted, near 5000 A., superposed on a background of a much more widespread band system, with more detailed structure This latter, almost certainly due to barium oxide, has been analysed by Mahanti, but the superposed system shows a correlation with the $C^2\Pi \rightarrow X^2\Sigma$ of the halides (Fig 1) Since the hydroxyl group in many ways resembles a halogen atom, it is suggested that the spectra noted arise from the radicals CaOH, SrOH and BaOH

Strong confirmatory evidence is obtained from measurements of the integrated intensity of these spectra in various flames obtained from mixtures of hydrogen, oxygen and nitrogen. A series of such mixtures can be chosen such that after burning in a Mèker type of burner they all give the same (sodium D line reversal) temperature. From the preburned compositions, it is possible to calculate the concentrations [OH] and [O] of hydroxyl radicals and oxygen atoms respectively for thermal equilibrium at the measured temperature of the interconal gases (at atmospheric pressure). If M represents an atom of metal in such gases, then

$$[M_0] = [M] + [M\text{OH}] + [M\text{O}],$$

if the oxide MO and the hydroxide MOH are the only compounds, $[M_0]$ representing the total concentrations in all forms Assuming the chemical equilibria $K_1 = [M]\,[\text{O}]/[M\text{O}]$, and $K_2 = [M]\,[\text{OH}]/[M\text{OH}]$, $[M_0]$ can be expressed in terms of $[M\text{OH}]$

$$\frac{[M_0]}{[M\text{OH}]} = \frac{K_2}{[\text{OH}]} + 1 + \frac{K_2[\text{O}]}{K_1[\text{OH}]}$$

Under these conditions, it is to be expected that the very great majority of the metal is present in the form of the oxide MO, making the first two terms of the above sum negligible[4,5], so that it reduces essentially to

$$\frac{[M_0]}{[M\text{OH}]} \sim \frac{K_2[\text{O}]}{K_1[\text{OH}]}$$

At a given temperature, for a series of flames with constant $[M_0]$ if the intensity I of a band is proportional to $[M\text{OH}]$, then a plot of $1/I$ against the calculated [O]/[OH] should be a straight line passing very nearly through the origin Such a plot is shown (Fig 2) for the 5560–5470 A band from calcium for a series of flames at 2,000° K Similar sets showing such behaviour have been obtained for the other calcium band and the bands from strontium, also with other series at different temperatures In the case of barium, finite intercepts are obtained, probably because of the background, for which it is difficult to correct The flames were all of the shielded type described by James and Sugden[6], and the amount of metal (added as fine sprays of dilute salt solution from an atomizer, the results not depending on the anion) too small to give self-reversal effects. The intensity of the bands, as well as of the resonance line of the metal, varied linearly with the amount added, indicating that they arise from molecules containing only one atom of metal

The much weaker emission found between 3500 and 4500 A for calcium and strontium was effectively constant in intensity with a given series of isothermal flame gases, and may be reasonably ascribed to the calcium and strontium oxides, which can be expected to account for well over 90 per cent of the metal The same is true for the barium flame spectrum outside the narrow limits shown in Fig 1. This method of using series of isothermal flames is therefore capable of giving diagnostic information about the emitters in such cases as this, and provides a valuable tool for the quantitative study of reactions at high temperatures The high intensity of the bands attributed to the radicals CaOH, etc , however, makes it very unlikely that they are present in

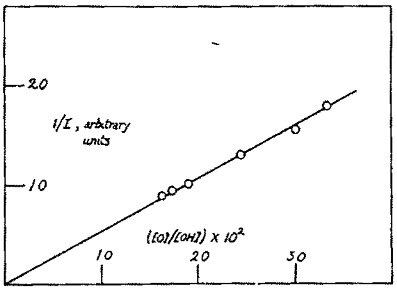

Fig 2 Plot of reciprocal intensity of the intense band in the calcium flame spectrum at 5560–5470 A against calculated [O]/[OH] for flames at 2,000° K

chemical equilibrium, as was assumed in the above scheme, and it is considered probable that they probably arise from collisional processes of metal atoms and OH to give excited molecules which revert to the ground state This would not affect the form of Fig 2, except that the slope of the line would no longer be simply related to equilibrium constants

A detailed account of this work will appear elsewhere. One of us (C G J) is grateful to the Department of Scientific and Industrial Research for a maintenance allowance [Sept 24

ELECTRIFIED DROPLETS FROM THE BURSTING OF BUBBLES AT AN AIR–SEA WATER INTERFACE

By DUNCAN C. BLANCHARD
Woods Hole Oceanographic Institution, Mass.

THE bursting of a bubble at an air–sea water interface is an effective mechanism for the production of airborne droplets[1,2]. For small bubbles the large majority of these droplets evolve from the vertical water jet which forms upon collapse of the bubble cavity This jet, we have found, moves upward at a high velocity and is transformed into five or six droplets. The height of projection of these droplets, a function of bubble size, may reach a maximum of 18 cm It seems certain that this process significantly contributes to the production of the airborne salt particles present over the oceans

Early in our study of breaking bubbles[1], it was found that the droplets produced by the vertical jet were electrically charged With the apparatus schematically shown in Fig 1, measurements were carried out on the sign and magnitude of this charge as a function of the radius of the droplet Bubbles were produced at a rate of 3–10 sec $^{-1}$ by pumping air under 10–30 lb /sq in. through a finely drawn out section of glass capillary tubing E. These bubbles burst at the surface of the sea water in the inner container F and ejected electrically charged droplets into the observation-region G This region was sealed off from the outside air by an open-bottomed rectangular 'Plexiglass' housing *B* which made contact with the sea water in the outer container *D*. It was necessary to use the outer container as a water seal since the distortion of the water surface near the 'Plexiglass' made it impossible to make observations near the water surface. The d.c. power supply *A* was used for producing a uniform, vertical electric field between the brass plate *C* and the earthed surface of the sea water in the inner container *F* by increasing the plate potential to any desired plus or minus value up to a maximum of 12 kV.

The determination of the electrical charge and radius of a droplet ejected by the jet from a bursting bubble was made in the following way. Before the droplet returned to the water surface, the voltage on the plate was adjusted until the droplet was stationary in the electric field. The gravitational force could then be equated to the electric force, giving an equation with two unknowns, the droplet radius and charge. The field-strength was then decreased to allow the droplet to move slowly downward. An equation of motion could then be obtained which, when solved simultaneously with the first equation, gave the droplet radius and charge. A cathetometer was used for observing the droplet and to determine its motion in the electric field. To avoid evaporation of the droplet while under observation, it was necessary that the air and water temperature were essentially the same.

All the results obtained to date, including those shown in Fig. 2, were from bubbles less than about 150 μ in radius the ejected droplets of which rose less than 20 mm. The weight of salt contained in droplets produced from this range of bubbles is comparable to that found by Woodcock[3] over the oceans. Curve A of Fig. 2 is for droplets from bubbles which were allowed to break in the presence of an electric field. In this manner all the droplets originating via the jet mechanism obtained, by electrostatic induction, a charge of opposite sign from that of the plate potential. For a given droplet radius, this charge was substantially the same in the range of fields from 50 to 300 V. cm.$^{-1}$. Curves *B*, *C* and *D* are for the natural charge on the droplets. In these cases the bubbles were allowed to produce droplets before the balancing electric field was applied. It will be noted that the results, unlike those for the induced charges tend to fall into three separate groupings. The first, for droplets less than 3μ radius, indicates an increase of charge nearly proportional to the fifth power of the radius. The second, for droplets between 3 and 6μ in radius, shows approximately a second-power relationship. Other results suggest that this curve is not unique but that a family of curves exists in this region. The third grouping, for droplets greater than 6μ radius, is similar to the second. The maximum charge per unit volume is obtained by droplets of about 3μ radius. At this radius the quantity of charge is nearly identical with that obtained when the bubbles break in the presence of an electric field. To date no explanation has been given for these groupings.

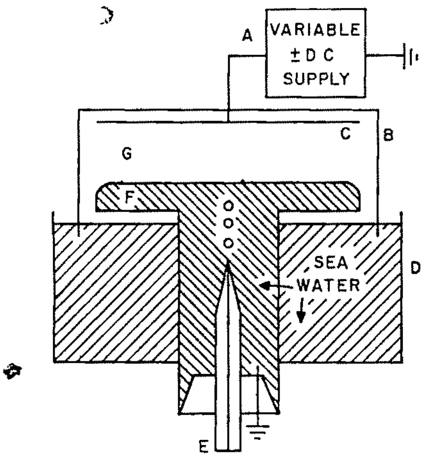

Fig. 1. A schematic view of the apparatus for suspending an electrically charged droplet in a vertical electric-field

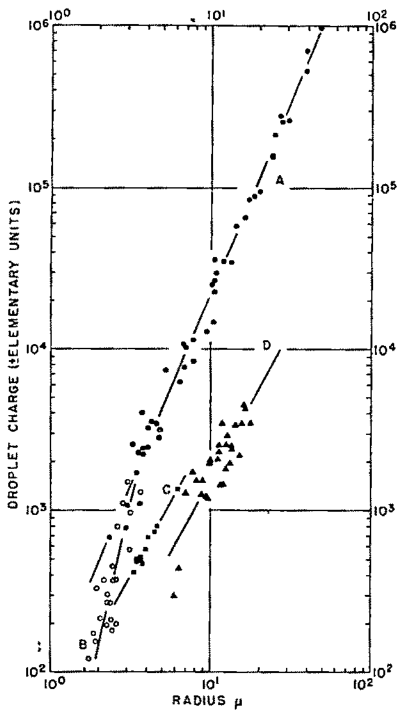

Fig 2. Natural and induced charge on droplets from bursting bubbles

If the maximum height of ejection of droplets is less than about 2 mm., the sign of the charge on all the drops is, almost without exception, positive. For ejection heights of 2–20 mm., which implies larger bubbles, the charge on the droplet ejected to the maximum height is still positive, while the lower droplets may show either sign.

These results lead to some very interesting speculations as to what might happen under various natural conditions. Consider, for example, a thunderstorm passing over the sea with a peak field-strength at the sea surface of 100 V. cm.$^{-1}$. From curve *A* of Fig. 2, one finds that all droplets less than 10 μ in radius originating from the jets of breaking bubbles will be carried upward towards the cloud. One might also wonder about the electric field at the surface of these droplets and its tendency to induce corona discharge. With the equation of curve *A* and Gauss's law, one finds that the field strength E (V. cm.$^{-1}$) at the surface of a droplet of radius R (microns) is $E = 1{\cdot}24 \times 10^3 R^{0{\cdot}4}$. With E varying only as the 0·4 power of the radius, the field-strength at the surface of droplets 3–50μ radius varies only from about 1,900 to 5,900 V. cm.$^{-1}$. These calculations assume that the charge is uniformly distributed over the surface of the drop. It is well known that a charged conducting sphere in a vertical electric field will have an intensification of the field on the top and bottom of the sphere. This intensification was computed, with Laplace's equation, for the droplets of curve *A* when they are subjected to an electric force just sufficient to balance the gravitational force. The computed fields were in no case more than 15 per cent larger than those given above. These fields are not sufficient for breakdown; but evaporation of the droplets, which almost invariably occurs under natural conditions, might raise the surface field to breakdown values.

It is likely that the positively charged droplets from the smallest bubbles alone carry an appreciable electrical current between the atmosphere and the earth. If one assumes a positive charge totalling 3,000 elementary units carried by the several droplets from a small bubble and, on the average, about one bubble per second per square centimetre breaking over the entire ocean area of the world, then a current of 1,800 amp. will be obtained. It is assumed, of course, that winds and turbulent diffusion will transport these small droplets upward. This current is of the same magnitude but in the opposite direction to the observed current-flow in fair-weather areas over the earth[4]. It is probable that the above estimate of the current carried by these low-mobility droplets is high, but, nevertheless, this mechanism may contribute significantly to the earth's counter or supply current, which at present is attributed to thunderstorms.

Further laboratory- and field-studies should lead to other interesting aspects of this production of charge on droplets from bubbles breaking at the sea surface. This work is being continued, and more detailed publication is planned for the future.

This work was supported by the Office of Naval Research, under contract number *Nonr*-798(00) (*NR*-082-124).

OCCURRENCE OF A NEW BASE IN THE DEOXYRIBONUCLEIC ACID OF A STRAIN OF *BACTERIUM COLI*

By D. B. DUNN and Dr. J. D. SMITH

Agricultural Research Council Plant Virus Research Unit, Molteno Institute, Cambridge

THE thymine-requiring strain of *Bacterium coli*, 15 T^-, was first described by Cohen, who has examined in detail several aspects of its physiology[1]. One of the most interesting observations was that, when placed in a synthetic medium lacking thymine, the cells will only survive 15–20 min. before rapidly losing their viability.

We have found that when grown under conditions of thymine deficiency or in the presence of 5-aminouracil or 2-thiothymine, *B. coli* 15 T^- produces a type of deoxyribonucleic acid containing considerable amounts of a new base. This base is also found in small amounts in the deoxyribonucleic acid from cells grown in excess of thymine and also from *B. coli* B.

B. coli 15 T^- was grown on a glucose – ammonium sulphate synthetic medium supplemented with thymine. The addition of the thymine analogues 5-aminouracil (10^{-3} *M*) or 2-thiothymine (2×10^{-3} *M*) to cells at a density of 2×10^{8}/ml. in medium containing 2·5 μgm./ml. thymine produced inhibition of growth, measured turbidimetrically, beginning after 90 min. (two generation times), and finally resulted in the formation of long bacterial filaments. These effects were completely reversed by the addition of 100 μgm./ml. thymine simultaneously with the inhibitor. Long bacterial filaments were also formed after growth in a thymine-deficient medium (0·2–0·5 μgm./ml.).

Deoxyribonucleic acids were prepared[2] from bacteria grown in the presence of 5-aminouracil, 2-thiothymine, or in low concentrations of thymine, and were hydrolysed in 72 per cent w/w aqueous perchloric acid[3], and the bases separated by two-dimensional paper chromatography in *iso*propanol–water–hydrochloric acid[4] and *iso*propanol–water–ammonia[5]. Unlike the 5-halogenated pyrimidines[6], 5-aminouracil and 2-thiothymine are not incorporated into *B. coli* 15 T^- deoxyribonucleic acids. However, all three nucleic acids gave, in addition to the four usual bases, a fifth ultra-violet-absorbing spot (*X*) which ran with cytosine in *iso*propanol–water–hydrochloric acid and slightly ahead of thymine in *iso*propanol–water–ammonia. *X* was also released from the nucleic acid after hydrolysis for 1 hr. at 55° in *N* hydrochloric acid. In this latter respect it behaved like the purines adenine and guanine.

The ultra-violet absorption maxima and minima of *X* are given in Table 1. Measurement of the change in spectrum over the *p*H range 0–14 indicated the presence of two dissociations with *pK* values of approximately 4 and 10, respectively. The presence of a basic dissociation (*pK* about 4) was shown by paper electrophoresis at *p*H 2·5 and 3·5, when *X* migrated towards the cathode. Its high R_F values in butanol–water–ammonia[7] and *iso*propanol–water–ammonia (Table 1) suggested that *X* possibly contained an alkyl group.

As at first we considered that *X* was likely to be an alkylated pyrimidine bearing a basic group, we compared it with a number of pyrimidines including 5-aminouracil, 5-methylaminouracil, 5-dimethylaminouracil, 5-amino-1-methyluracil, 5-amino-4-methyluracil and 4-amino-5-methyluracil. It soon became apparent that *X* behaved more like a purine than a pyrimidine, and after comparison with several purines (including 2-methyladenine, 6-methylpurine, 8-methylpurine and 6-ethylaminopurine) we found that 6-methylaminopurine[8] was identical with *X* in its ultra-violet absorption spectrum, its chromatographic movement in five different solvents and its electrophoretic mobility at *p*H 2·5 and 3·5 (Table 1). On heating at 120° in 6 *N* hydrochloric acid for 18 hr., both *X* and 6-methylaminopurine were converted into substances which did not absorb ultra-violet light. These on paper chromatography in butanol–water–formic acid, *iso*propanol–water–ammonia or *iso*propanol–water–hydrochloric acid were in each case shown to contain two ninhydrin-reacting substances one of which corresponded to glycine. On hydrolysis with strong hydrochloric acid the purine ring is known to break down, giving

* The absorption maximum of this compound is very flat

glycine, carbon dioxide, carbon monoxide and ammonia[9] Both *X* and 6-methylaminopurine form insoluble silver and cuprous salts[10] a characteristic of some purines. Treatment with sodium nitrite in acetic acid converts *X* into a substance differing from *X* in its chromatographic behaviour and no longer bearing a positive charge at *p*H 3 5, so it does not migrate on electrophoresis With this reagent, 6-methylaminopurine gives a product which is presumably 6-methylnitrosaminopurine. This is indistinguishable from the compound formed from *X* in its chromatographic movement in butanol–water–formic acid, its electrophoretic behaviour at *p*H 3 5 and its ultra-violet absorption spectrum (Table 1).

We have also isolated, from 15 T^- deoxyribonucleic acid containing *X*, a substance with the expected properties of the nucleoside of *X*. The nucleic acid was treated with deoxyribonuclease and rattlesnake venom diesterase and 5′-nucleotidase, and the hydrolysate run on paper chromatograms in *iso*propanol–water–ammonia. The deoxyriboside of *X* runs ahead of thymidine and the free base *X*. On paper electrophoresis at *p*H 3 5, it runs more slowly than *X* because of the greater frictional resistance of the larger molecule At *p*H 1 and 7 its ultra-violet absorption spectrum is similar to that of *X* , but, unlike *X*, the maximum does not shift to the longer wave-lengths at *p*H 13 (Table 1). On treatment with *N* hydrochloric acid at 55° for 1 hr. it is converted to a substance identical with *X*.

A more careful examination of deoxyribonucleic acid from bacteria grown in excess of thymine showed that these contained small amounts of *X* amounting to about 0 4 per cent of the total bases Quantitative analysis of deoxyribonucleic acids from bacteria grown in the presence of 5-aminouracil, 2-thiothymine, or low concentrations of thymine, showed that, in comparison with nucleic acid from bacteria grown in excess of thymine, the former contained about 20–30 per cent less thymine relative to the other bases, and that this deficiency was almost quantitatively accounted for (on a molar basis) by the amount of *X* present. In these nucleic acids the amount of adenine was also decreased by about 5 per cent.

Table 2 MOLAR PROPORTIONS OF PURINES AND PYRIMIDINES IN DEOXYRIBONUCLEIC ACIDS OF *B coli* 15 T^- GROWN UNDER DIFFERENT CONDITIONS

Conditions of bacterial growth	Total bases (moles/100 moles)				
	Adenine	Guanine	Cytosine	Thymine	*X*
25 μgm /ml thymine	23 6	27 5	26 2	22 4	0 4
1 5 μgm /ml thymine + 10^{-4} *M* 5-amino-uracil	22 3	27 6	26 6	19 1	4 2

We conclude that the new base *X* is 6-methylaminopurine This has already been shown to replace adenine in the growth of *Lactobacillus casei*[11], and by studying the effect of this substance in the nucleic acid metabolism of *B. coli* 15 T^-, we hope to discover the reason for its appearance in the deoxyribonucleic acids under conditions of thymine deficiency The fact that 6-methylaminopurine apparently replaces thymine residues in the nucleic acid is extremely difficult to reconcile with the theory of replication proposed by Watson and Crick on the basis of their structure for deoxyribonucleic acid[12] and may mean that the nucleic acid formed is abnormal in other respects. In fact, it was for this reason that we first compared *X* with a number of 4- and 5-substituted pyrimidines in order to eliminate the possibility that it might be a pyrimidine so substituted as to make its deoxyriboside behave like a purine deoxyriboside towards acid hydrolysis

We wish to thank Dr. S S Cohen for the culture of *B coli* 15 T^-, Dr. D J Brown and Dr. D. M Brown for gifts of chemicals and Dr. E Lester Smith and Dr. A M Michelson for chemical advice. One of us (D B. D) wishes to thank the Agricultural Research Council for a studentship held during the course of this work. [Dec. 9.

The Endocrine Chain in an Insect

It is now well recognized that growth and moulting in the insect are initiated by a hormone produced in the neurosecretory cells of the brain. This brain factor activates the thoracic gland, which is then believed to secrete the definitive growth and moulting hormone[1]. But the possibility remains that there may be yet further links in the chain of endocrine organs, located in the abdomen.

The œnocytes and the dermal glands have already been excluded[2], but the pericardial cells and the various types of hæmocytes are obvious possibilities. Blockage of the hæmocytes by the injection of Indian ink into the 4th-stage larva of *Rhodnius* at one day after feeding causes a delay in moulting which may range from one to three or four weeks beyond the normal fourteen days. Blockage of the pericardial cells with trypan blue has no effect—unless sufficient is injected to fill the hæmocytes also. Similar results are obtained with iron saccharate.

These injections no longer cause any great delay if made later than the third day after feeding (Fig. 1): clearly they interfere with the initiation of mitosis in the epidermis (which begins at the fourth or fifth day), not with the ordinary processes of intermediary metabolism. The detailed study of the hæmocytes in *Rhodnius* is not yet complete, but there is already histological evidence of secretory activity becoming evident on the fourth day after feeding.

Butenandt and Karlson[3] have recently succeeded in isolating in crystalline form from the pupæ of the silkworm an active principle which will induce puparium formation in *Calliphora* and which, as proved by Williams[3], will cause renewed development in the diapausing pupa of *Platysamia*. Through the kindness of the German authors I have been able to test the activity of their hormone on *Rhodnius* and have found that 0·5–0·75 μgm. injected into the decapitated 4th-stage larva at twenty-four hours after feeding (weight about 80 mgm.) will induce moulting. In *Rhodnius*, as in *Platysamia*, the hormone is equally effective when injected into the isolated abdomen. This suggests, as Butenandt and Karlson point out, that it is the active principle of the thoracic gland. But in view of the observations reported in this communication, the possibility remains that it may be a product of the hæmocytes. That possibility is favoured by the observation that moulting induced by injection of the hormone is not delayed by blockage of the hæmocytes with Indian ink or iron saccharate.

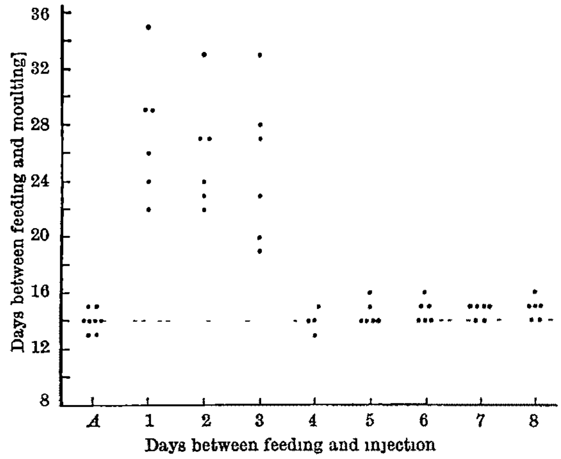

Fig. 1. Effect of blockage of the hæmocytes on the time between feeding and moulting in the 4th-stage larva of *Rhodnius*. 5 mm.^{3} of 2 per cent iron saccharate was injected into batches of six larvæ on the first to the eighth day after feeding. *A*, control batch of eight which received no injection

A Critical Response to Changing Length of Day in an Insect

In British populations of the emperor dragonfly, *Anax imperator* Leach, the final larval instar is usually entered in August. A diapause follows, and metamorphosis is postponed until the following spring. In this way, emergence of the adult is closely synchronized[1].

Close inspection of the time-frequency distribution of emergence has shown it to be bi-modal, and it has been established that the larvæ emerging in any one year are of two distinct types.

The first, major emergence group (Fig. 1, *A*) is composed of larvæ which have entered the final instar the previous year and have since completed diapause. The second emergence group (Fig. 1, *B*), which is developed to a variable extent from year to year, and which seldom comprises more than 10 per cent of the annual population, is made up of larvæ which have over-wintered in the penultimate larval instar, entered the final instar in spring, and emerged shortly afterwards.

That larvæ of the second group metamorphose without delay demonstrates that the diapause in the final instar must be facultative, being induced in summer and autumn, yet being averted in spring. In Nature, it was found that the latest date upon which the final instar was entered by a larva destined to forgo diapause was May 28. Since the duration of metamorphosis is known, a further check is provided by the latest dates of emergence, which are closely similar from year to year. From three years of observations there is strong evidence for concluding that diapause is averted in larvæ entering the final instar before June 1, but is induced after that date.

The seasonal incidence of diapause suggests that the environmental factor responsible for its determination is likely to be the sign of change in successive lengths of day. Preliminary experiments conducted in 1952 have lent support to this thesis. In these experiments, larvæ experiencing unchanging photoperiods of a length corresponding to July 31 responded in a fashion similar to those subjected to a regime of decreasing lengths of day, both groups entering diapause.

This observation suggests that, when daily increments fall below a certain threshold value, they are no longer appreciated as such, but are recorded by larvæ as being of constant length, until such time after the summer solstice as decrements begin to

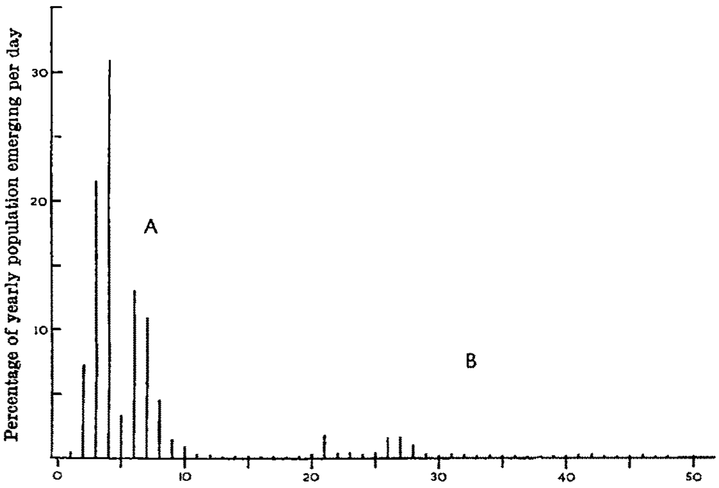

Fig 1 Time-frequency distribution of adult emergences in a population of *Anax imperator* during 1952 *A* Main emergence group provided by larvæ which had completed diapause *B* Subsidiary emergence group provided by larvæ in which diapause had been averted Emergence began on May 17 and finished on July 5

exceed the threshold. If this is so, then the observation that diapause is induced after June 1 means that larvæ are unable to discern increments of less than about two minutes *per diem*

Spring species have been defined as those possessing a diapause in the final larval instar[1]. For the diapause to be determined facultatively obviates the necessity for larvæ entering the final instar in spring to postpone emergence for one year , but, at the same time, it extends the emergence period The extent to which the emergence period is lengthened will depend upon the value of the threshold increment of length of day that evokes a response Members of a spring species in which diapause has been averted will possess the properties of summer species. Thus, in the first emergence group of *A. imperator*, emergence is closely synchronized whereas, in the second, it is temporally dispersed (see Fig. 1).

A imperator is thought to be the first invertebrate in which a response to changing, rather than absolute, photoperiod has been discerned. It is noteworthy that previous studies on diapause have involved uni- or multi-voltine animals For species having a larval duration of more than one year, it is probable that some factor more incisive than absolute photoperiod is required as a seasonal indicator. It is therefore likely that a similar response exists in other long-lived invertebrates of temperate regions

A Model of Cortical Activity

IN a study of the organization of the cerebral cortex, alternative experiments on the evoked potentials of the hippocampus and of the isocortex were performed in order to apply the findings in the more simply constructed layer of Ammons pyramids to resolution of the electrical fields of the cortex proper. The former consists essentially of one layer of similarly oriented cells, whereas the latter structure shows duplication in the form of stratified supragranular and infragranular layers We have found that the electrical correlates of the layered isocortex are not in the direction that at first seemed obvious For one thing, the d c standing potential across the unstimulated isocortex is less rather than greater than that across the pyramid cell-layer of the hippocampus, suggesting that the cell dipoles are not arranged in series. Furthermore, the overall potentials of activation of an area of the isocortex show an increase in magnitude during inactivation of the supragranular layer

A consideration of some well-known facts will indicate the manner of derivation of the model The supragranular layer is more variable than the infragranular, both between species[1] and between neighbouring cortical regions in the same species (unpublished work). The infragranular layers are everywhere more uniform, suggesting a protean function. The experiments of Murphy and Dusser de Barenne[2] show that motor function survives the destruction of the supragranular layers of the precentral cortex and demands only the integrity of the deep cells. This suggests that the topmost part of the cortex may be regulatory Morphologically, the characteristic and unique type of cortical cell, the pyramids, has in its apical dendrite a feature which has not been accounted for in any previous model of cortical function

In Fig. 1 is illustrated our finding that there is a release of the isocortex, in the reaction to an afferent

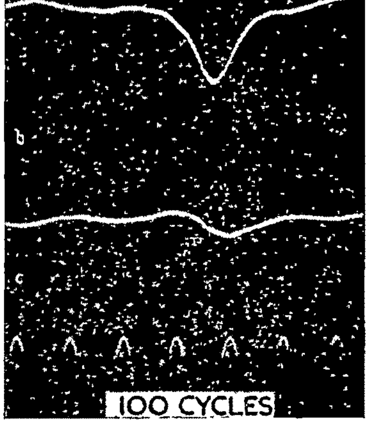

Fig 1 Sequence of records from the sensory cortex of a rabbit evoked by stimulation of the sciatic nerve (*a*) before, (*b*) during, and (*c*) after narcotization of the cortex with cyanide applied to the pial surface Time in milliseconds

stimulus, following narcotization of the supragranular layers This has been seen to occur with a variety of narcotic and poisonous agents, and in cortical activity evoked by stimulation of various afferent sources as well as via the corpus callosum Rendering the surface layers of the isocortex subnormal by adequate stimulation has resulted in a similar release, or augmentation, of the activity

To account for these experimental facts and to harmonize with the other relevant observations, we propose the following model of cortical activity The potential differences maintained across the cell bodies of the cortical neurons are a measure of their polarization and regulate the firing pattern Because the cortical cells have apical dendrites ramifying in the molecular layer, the successive tiers of cells are not in series, in so far as their electrical fields are concerned Instead, the external current flow of the cells of one layer tend to reverse the polarization of members of the other and thus modulate their impulse discharge. In this way, the small and medium-sized pyramids of the supragranular layer act as a ballast to the efferent cells and inhibit their activation by the afferents When the supragranular layer is thrown out of action, the cortical response is more vigorous

The mechanism which we are postulating does not require the degree of discrete signal transference from cell to cell which is widely assumed In this respect it fits in well with the results of our studies, for we have found, as Jasper (ref 3, p 146) has previously remarked, that cortical discharges evoked by stimulation of afferent pathways are surprisingly uncomplicated and uniform events. Such a fact is hard to reconcile with the idea that discrete bits of information trickle through the cortex. Thus both our findings and our interpretation lend support to those who feel that the relation of cortical activity to so complex a phenomenon as mentation must involve dynamic sequences such as the moving domains of Cragg and Temperley[4]

Sialic Acids

IN 1936[1] one of us (G B) isolated from bovine submaxillary mucin a crystalline reducing acid, later[2] named 'sialic acid'. Qualitative reactions indicate that sialic acid or substances closely related to it occur in most epithelial mucins, in ovomucin, in the glycoproteins of blood serum and in gangliosides[3] Crystalline substances reacting like sialic acid have now also been isolated from porcine, ovine and equine submaxillary mucin None of these products is, however, identical with any of the others—a fact already evident from the X-ray powder diagrams (Fig 1).

Fig 1 X-ray powder diagrams of (*a*) bovine, (*b*) ovine, (*c*) porcine and (*d*) equine sialic acid

The bovine sialic acid crystallizes in monoclinic rectangular plates, the others in needles or prisms Although each substance appears microscopically uniform and invariably gives in different preparations the same X-ray diagram, elementary analyse have not given values consistent enough to establis definitely the compositions. The most probabl compositions are

Bovine sialic acid, $C_{13}H_{23}NO_{11}$ (or $C_{13}H_{21}NO_{10}$ H_2O)
Porcine „ „ $C_{11}H_{19}NO_{10}$
Ovine „ „ $C_{11}H_{19}NO_9$

(The purified equine substance has not yet bee obtained in quantities sufficient for elementar analysis)

Bovine sialic acid contains an N-acetyl group, an an O-acetyl group which is very easily split off Th ovine substance has only an N-acetyl group, and th porcine acid no acetyl group but instead an N glycolyl group. The glycolic acid was isolated an identified as the calcium salt.

Periodate splits off one primary alcohol group fro sialic acids On treatment with concentrate sulphuric acid, carbon monoxide is liberated—rath less than one mole per mole for bovine and ovi sialic acids and rather more than one mole per mo for the porcine substance This probably indicat the presence of an α-hydroxy-group in each of the and accounts for the glycolic acid in the porci sialic acid

Titration with hypoiodite, as described by Wil staetter-Schudel, indicates the presence of an aldehyde group. This conforms with the finding tha on treatment with sodium borohydride approx mately one molecule of hydrogen is taken up pe molecule of sialic acid. The Schiff reaction wit fuchsin-sulphurous acid (as modified by Tobie[4] however, is only very faintly positive for bovi sialic acid, and is negative for the other two

After reduction of sialic acid with sodium borohydride, subsequent treatment with dilute hydrochloric acid at 100° produces no reducing substance This almost excludes the presence of a glycosidi linkage in the molecule The presence of three end groups and the almost certain absence of a glucosidi linkage suggest a branched carbon chain in the molecule The infra-red spectra have given no additiona clue to the structure Only end-absorption startin at about 2500 A. is seen in the ultra-violet.

The optical rotations of the ovine and porcin sialic acids remain constant at room temperature whereas that of the bovine acid changes very slowly probably owing to decomposition or ring-formation The substances melt with simultaneous decomposition, already showing some browning below the decomposition point

	$[\alpha]_D$	Decomp point
Bovine sialic acid	+ 8° ± 2°	152–153° (uncorr)
Porcine ,, ,,	− 31° ± 2°	185–187° ,,
Ovine ,, ,,	− 32° ± 2°	185–187° ,,

The 2-carboxy-pyrrole found by Gottschalk[5] as a product of splitting on alkaline hydrolysis of submaxillary mucin is no doubt formed by a cyclization process during the alkaline decomposition of sialic acid The neuraminic acid of Klenk[6], the hæmataminic acid of Yamakawa and Suzuki[7], and the lactaminic acid of Kuhn[8] obviously all bear a very close relation to sialic acid The first two probably simply represent de-acetylated sialic acids.

A detailed report of this work will appear elsewhere

Note added in proof. The assumption of the presence of a branched carbon chain in the sialic acid molecule has received additional support by recent micro hydroxyl-group determinations. These revealed six hydroxyl groups per molecule in the porcine sialic acid and five in that of the bovine substance.

Biological Decomposition of Aromatic Nitro-compounds

Certain organic nitro-compounds, for example, chloramphenicol, are known to arise biologically , but very little is known about the transformation of this class of compounds by micro-organisms Erikson[1] and Moore[2] found that certain Actinomycetes could utilize picric acid, trinitroresorcinol, and nitrobenzene, and Simpson and Evans[3] have reported briefly on species of *Pseudomonas* that decompose *o*- and *p*-nitrophenol with the formation of nitrite , the last workers also mention nitrite production from 2,4-dinitrophenol and chloramphenicol

According to a personal communication from Mr H. Ingvard Petersen (Government Weed Research Department, Lyngby, Denmark), the herbicide dinitro-*ortho*-cresol is rapidly inactivated in soil, apparently by biological agencies, whereas the chemically related herbicide dinitrobutylphenol appears more persistent From the soil used in these detoxication experiments, we have isolated an organism that decomposes 4,6-dinitro-*ortho*-cresol and several related compounds with release of nitrite

The organism appears in young cultures as a non-spore-forming, Gram-positive, irregular rod, approximately 1 4–4 0 μ × 0 6–0 8 μ, in characteristic angular or parallel arrangements , the cells in older cultures become shorter or almost coccoid, 0 7–1 3 μ in diameter Taxonomically, it seems to be an atypical form of *Corynebacterium simplex*[4]. Decomposition of dinitro-*ortho*-cresol in solution as well as in agar medium is evidenced by the bleaching of the yellow colour and the appearance of nitrite. Growth is possible in a synthetic medium with no other organic constituents than 0·01–0 05 per cent dinitro-*ortho*-cresol (as sodium salt), but is slow and unreliable under these conditions , addition of 0 01–0 1 per cent yeast extract greatly accelerates growth and nitrite formation The results of an experiment in liquid medium with 0 02 per cent dinitro-*ortho*-cresol and 0 01 per cent yeast extract are shown in Fig. 1. (Nitrite and residual dinitro-*ortho*-cresol were both determined colorimetrically on a Coleman spectrophotometer, the former by means of the Gries reagent, the latter directly by the intensity of the yellow colour.)

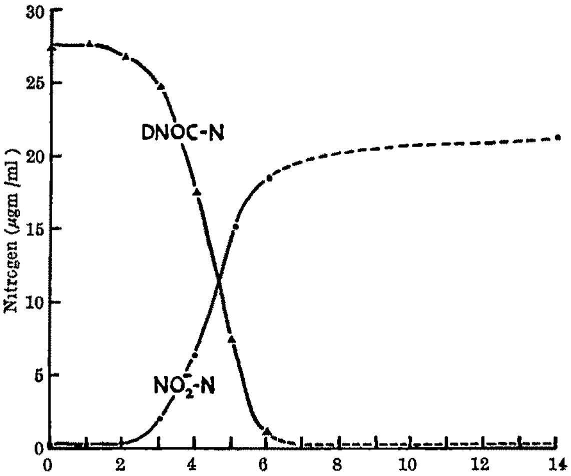

Fig 1 Production of nitrite from dinitro-*ortho*-cresol (approx 10^{-3} *M*) by *Corynebacterium* sp (*simplex* ?) in liquid medium incubated at 25° C

Besides 4,6-dinitro-*ortho*-cresol, the organism decomposes *p*-nitrophenol, 2,4-dinitrophenol, and 2,4,6-trinitrophenol (picric acid), but not *o*- and *m*-nitrophenol, 2,5- and 2,6-dinitrophenol or 3,5-dinitrobenzoic acid. Thus only compounds with a nitro-group in the *para*-position appear liable to attack , we have not, however, been able to detect nitrite formation from 4,6-dinitrobutylphenol, which also seems to be less readily inactivated in soil, as mentioned above The results in Fig. 1, as well as similar experiments with dinitrophenol, show that more than half the nitrogen in dinitro-compounds is converted into nitrite, that is, both nitro-groups are metabolized Possibly the *p*-group represents the point where the enzymatic attack begins and the ring-structure is broken, with subsequent release of the second nitro-group

The results of these experiments will be published in detail elsewhere

Meaning of 'Turnover' in Biochemistry

HEVESY[1] considers the determination of the rate of renewal, or turnover, as one of the most important applications of tracers A clear definition of the term 'turnover' is therefore of obvious interest. In the present literature the term 'turnover' is used with two different meanings This leads to confusion.

Zilversmit, Entenman and Fishler[2], and later other workers in Chaikoff's laboratory[3,4], use 'turnover-rate' as a synonym of rate of disappearance. According to this definition, turnover-rate has the dimension: amount/time. Siri[5], on the other hand, uses 'turnover-rate' as the reciprocal of turnover-time. According to his definition, therefore, turnover-rate has the dimension 1/time, that is, it is Zilversmit's rate divided by pool content

Even though it may not have chronological seniority, Siri's terminology is preferable because it is more logical. We may speak of transfer-rate or exchange-rate from one pool to another, or rate of disappearance from one pool, and can say, for example, how many atoms (or grams) of phosphorus are exchanged per unit of time or disappear from a pool per unit of time, and the rate of turnover is the number of times a given pool of, say, phosphorus atoms is turned over, or is renewed, per unit of time As the rate of turnover of a wheel (presumably the original for the analogy) is the linear velocity of the car divided by the circumference of the wheel, so the rate of turnover of a metabolic pool is the transfer-rate divided by the pool content.

If the concentration of tracer changes as a first-order process

$$\frac{d\alpha}{dt} = k\alpha,$$

where α is concentration of tracer (that is, specific activity) and t is time, then k stands for the 'rate constant' in the terminology of chemical kinetics.

If the change in tracer concentration is the result of a transfer process with a constant rate of transfer, a (amount per unit time), from a constant pool content, A, then

$$k = \frac{a}{A},$$

where a/A is the relative rate of transfer. Then,

$$\frac{\text{amount/time}}{\text{amount}} = \frac{1}{\text{time}}.$$

This relative rate of transfer tells what fraction of the pool content, A, is transferred per unit of time or, if a is larger than A, how often the pool content A is turned over per unit of time. This relative rate of transfer is therefore properly called 'turnover-rate' Its reciprocal A/a shows how much time is required for one turnover of a pool of content A This is the 'turnover-time'.

'Renewal-rate' is a synonym of 'turnover-rate', and a similar argument applies for its definition In tracer work we do not study renewal of atoms but of pools, and the renewal-rate should show how many times a pool is renewed per unit of time

It is suggested that for the sake of clarity in terminology, the term 'turnover-rate', or its synonym 'renewal-rate', be used exclusively as an index for the number of times the content of a pool turns over or is renewed, which is the reciprocal of time of turnover

Feulgen-negative Nuclear Division in *Habrobracon* Eggs after Lethal Exposure to X-Rays or Nitrogen Mustard

THE females of the parasitic wasp *Habrobracon juglandis* (Ashmead) when well fed will store eggs in the first meiotic metaphase (metaphase-1) and retain them until the female is placed with the host[1]. The unfertilized eggs develop into viable haploid males. When the untreated egg is oviposited, meiosis proceeds and the pronucleus is formed 30 min after oviposition at 30° C The nuclei divide synchronously at the rate of approximately one division every 15 min At the ninth or tenth cleavage stage (2½–3 hr. after oviposition) most of the nuclei migrate to the egg periphery. After two or three more divisions, cell membranes slowly form between the nuclei, and tissue differentiation begins The embryo hatches about thirty hours after oviposition and feeds on the paralysed host

In the present experiments, well-fed females were treated with X-ray exposures of 10 kr (1 5 kr./min) or an equivalent dose of nitrogen mustard (prophase-1 hatchability was criterion[2]). This exposure is approximately five times the lethal dose for metaphase-1 oocytes The X-rays were delivered by a G. E. Maxitron-250 unit operating at 250 kVp, with a tungsten target and 1 mm. aluminium inherent and 3 mm. of aluminium added filtration (half-value layer, 0 55 mm copper), the nitrogen mustard (kindly supplied by Merck and Co) was delivered in the form of an aerosol. The subsequent development of eggs which were in metaphase-1 during the time of treatment was studied, the eggs were fixed in Kahle's fluid at various times after oviposition and were stained according to the Feulgen procedure after optimum hydrolysis in 1 N hydrochloric acid.

More than 95 per cent of the eggs treated with X-rays and all eggs treated with nitrogen mustard were identical in their developmental pattern. Meiosis proceeds at a normal rate, even when chromosome bridges are present. The first cleavage is partially inhibited, particularly but not specifically at metaphase, for one to two hours after oviposition—nuclear division then slowly proceeds until two to eight Feulgen-positive interphase or prophase nuclei are present, usually near the anterior end of the egg. At approximately the eighth hour after oviposition, ooplasmic areas can be seen within the yolky egg interior. These areas are ordinarily diagnostic for cleavage nuclei, but nothing definite can be recognized within them except for occasional spindle-like structures By the ninth or tenth hour, Feulgen-negative bodies which are otherwise identical with interphase nuclei begin to appear in the ooplasmic areas These become distributed throughout the yolky interior By the tenth or twelfth hour, 50–150 of the Feulgen-negative nuclei have appeared, and they begin to enlarge gradually The two to eight Feulgen-positive nuclei can occasionally be detected at this stage, and they also usually enlarge When nuclear enlargement begins, apparently no more Feulgen-negative nuclei are formed. At twenty hours after oviposition, enlargement of the Feulgen-negative nuclei is nearly maximal (up to 200 times the normal volume) and the Feulgen-positive nuclei are usually not easily detectable

It has been known for several years that, at lethal exposures, both X-rays and nitrogen mustard more or less immediately and specifically interfere with deoxyribonucleic acid synthesis, whereas other intracellular syntheses are not directly disrupted[3] It is probable, therefore, that the strange lethal action of these mutagens on the *Habrobracon* egg is intimately associated with a failure in synthesis of deoxyribonucleic acid. The presence of a few Feulgen-positive nuclei militates against the possibilities that deoxyribonucleic acid is too diffuse to be detected, or that the original pronuclear chromosomes undergo segregation and nuclear division ends with equal and complete distribution of the deoxyribonucleoprotein strands It may be that the characteristics of deoxyribonucleic acid are changed by mutagens so that hydrochloric acid hydrolysis, necessary for removal of purine prior to aldehyde–fuchsin coupling, removes most of, or all, the deoxyribonucleic acid , this hypothesis appears to be contrary to available information[4] Perhaps synthesis of deoxyribonucleic acid has been blocked by nitrogen mustard or X-rays, and the new nuclei are products of other reduplicating systems which are synthesized and replicated until deoxyribonucleic acid is required for further development This proposal must be regarded with considerable caution, since the participation of deoxyribonucleic acid in genetic continuity is a well-established phenomenon[5]

Chromosomes and Nucleoli in *Pisum sativum*

SINCE the beginning of the century, reports have een published in which an ideogram has been given, r at least the morphology of the chromosomes has een described, of *Pisum sativum* With improved echniques and with a better understanding of hromosome structure, it is reasonable to suppose hat recent workers would be in agreement In the atest observations[1], all authors agree that there are ourteen chromosomes in a normal diploid cell , but ere agreement ends There is disagreement over he positions of the centromeres, the number of hromosomes with satellites, and the position of these satellites and their connexion with the nucleoli In addition, a number of secondary constrictions (non-nucleolar) have appeared from time to time in nearly all the chromosomes The majority of these constrictions can, we believe, be traced to the action of the drugs used on the cells prior to fixation The doubts over the relationship of satellites and nucleoli have been prevalent since 1942, when Hakansson and Levan[2] reported that nucleoli are formed at the centromeres of all the chromosomes and that the visible constrictions in the chromosomes are not associated with nucleolus formation

To facilitate the examination of the chromosomes at mitosis, we used monobromonaphthalene and 0 05 per cent colchicine to disorganize the spindle and shorten the chromosomes The use of these drugs is a standard technique and they are not known to produce extra constrictions in the chromosomes La Cour's 2 *BE* proved superior to 2 *BD* or acetic alcohol as a fixative Staining with Feulgen was also superior to either aceto-carmine or aceto-orcein for mitosis Fast green was used as a counter stain to show nucleoli

In the diploid somatic cells, there are usually one or two nucleoli, and occasionally three or four, but never more As corroborative evidence, no more than two nucleoli per nucleus have been observed in the haploid pollen grains Contrary to a previous report[2], we did not find extra nucleolar bodies in the cells at root-tip mitosis, nor did we observe persisting nucleoli at metaphase or anaphase stages of division Two pairs of the chromosomes have nucleolar constrictions and thus have satellites, one pair of satellites being smaller than the other Both pairs are on the long arms of the chromosomes At prophase the attachment of the four chromosomes to the nucleolus, or nucleoli, leaves no doubt that they are definitely associated with nucleolus formation Other secondary constrictions were not observed in any chromosomes In the longest pair of chromosomes the centromere is submedian. There are two short pairs with median or near median centromeres, and one longer pair with a definite subterminal centromere In the remaining pair the centromere is subterminal, but not as markedly as in the nucleolar chromosomes After contraction with drugs, the longest chromosome is only about 4 μ long, and it is therefore difficult and sometimes impossible to pick out all the individual chromosome pairs in a cell Our ideogram (Fig. 1) is therefore presented with a certain amount of reservation In other words, we are unprepared to say that we can distinguish between several chromosomes that are within 0 5 μ of each other in length Our ideogram is substantiated by the sizes and shapes of the chromosomes at second anaphase of meiosis and at mitotic anaphase in pollen grains.

Our squashes of meiotic stages were stained with aceto-carmine and sometimes also with fast green At prophase only one or rarely two nucleoli are formed Frequently they are cap-shaped The prophase division stages are abnormal in that the chromosomes are indistinct and diffuse from after

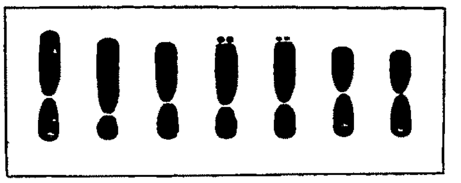

Fig 1 An ideogram of the chromosomes of *Pisum*

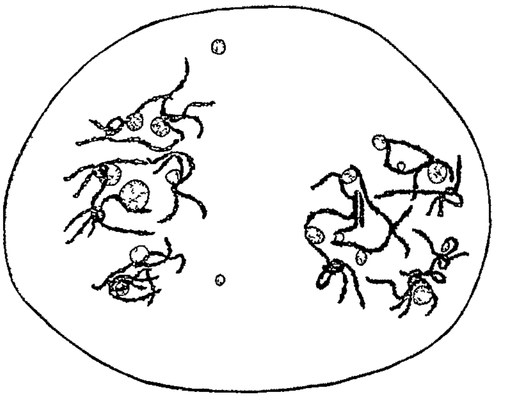

Fig 2 Late prophase of second division of meiosis Note the number and the positions of the nucleolar bodies on the chromosomes × 1,000

pachytene until just prior to first metaphase Along with this condition there is an obvious granular appearance of the nuclear contents. At first telophase a nucleolar-like substance appears interspersed with the chromosomes. During the short resting-stage and the prophase of second division, this substance forms into distinct globules which are associated with the chromosomes (Fig 2) At the same time there are several smaller bodies lying free in the cytoplasm In the nucleus they vary in number from one to twelve There may be one formed on each chromosome, there may be two or three or none What we wish to emphasize is that the bodies arise from the substance that first appears at telophase They are not formed at specific loci of the chromosomes We therefore disagree with Hakansson and Levan, and with Marshak, who reported that the nucleoli were formed at the centromeres of each chromosome. These nucleolar-like bodies disappear at second metaphase and reappear at the following telophase They are present again both inside and outside the nucleus at the tetrad stage They are, however, reduced in number in the nucleus The most we have seen is five

The existence of nucleolar-like bodies or 'telophase globules' is not confined to *Pisum.* We have also seen them in *Zea mays* and in *Phaseolus*, and they have been reported in several species of *Fritillaria*[3]

The nucleolar substance stains like normal nucleoli, the globules appear and disappear at the same stages of division as the nucleoli. They are, in fact, indistinguishable with nucleoli but are not confined to specific loci However, in the root meristems, at prophase of mitosis in pollen grains and probably at prophase of meiosis, the formation of nucleoli is directly associated with specific loci, that is, the nucleolar constrictions. A special system of nucleolus formation may be operative in some species of plants, or may be operative in all species but more obvious cytologically in some

Use of the Mouse for Detection of Small Numbers of Tubercle Bacilli

Following early experiments[1], it was considered that the mouse was one of the animals most resistant to tuberculosis More recently, it has been found that the mouse could be readily infected by the intravenous route[2], or by inhalation[3], but it was still considered to be highly resistant to subcutaneous infection. It was found[4] that $C57$ black mice, maintained on a deficient diet and infected intranasally, were as sensitive as the guinea pig for the detection of small numbers of tubercle bacilli. The small lesions produced in the lungs had to be examined microscopically, as non-specific lesions sometimes occurred, in tuberculous lesions there were, of course, numerous bacilli

The mouse is obviously more economical to use than the guinea pig, but the breeding and maintenance of $C57$ mice on a deficient diet and their intranasal inoculation have certain disadvantages for routine work, an attempt was therefore made to develop simpler methods. It is well known that tubercle bacilli multiply freely in the mouse, but sometimes produce very slight lesions Carbon was therefore added to the suspensions of tubercle bacilli so that the position of the inoculum could be seen In preliminary experiments mice were infected by the intravenous, intraperitoneal, intrapulmonary and subcutaneous routes

Carbon was found to be of no special value following intravenous infection, and direct intrapulmonary injection was not regularly successful. Aggregates of carbon were readily found in the omentum following intraperitoneal infection, and sometimes the bronchial lymph nodes contained much carbon, but multiplication of bacilli was not great in these sites The site of inoculation was readily found following subcutaneous (or often intramuscular) infection and, rather surprisingly, it appeared that multiplication of bacilli was abundant and regular, so a more extended series of experiments was performed

Cultures were grown on Loewenstein's medium, weighed when moist, and emulsified in distilled water containing 1 per cent serum. Dilutions were made in this fluid, to which carbon had been added. Each mouse, guinea pig or culture tube was inoculated with 0 1 c.c. of dilution Mice and guinea pigs were killed at intervals and smears made from the small black foci in the subcutaneous or intramuscular tissues and from the regional lymph nodes. Cultures were examined at the same time

Doses of 10^{-4} to 10^{-8} mgm. of human tubercle bacilli were used, and the smallest dose gave negative results in mice, guinea pigs, and on culture tubes Doses of 10^{-7} mgm produced growth on only two or three of four tubes of Loewenstein's medium and produced no lesions in one of four guinea pigs Bacilli were, however, found in all eight mice killed three to six weeks after infection, and in the last mouse small clumps of bacilli were found easily, and there were numerous isolated bacilli. Doses of 10^{-6} mgm produced growth on only two or three of four tubes of Loewenstein's medium, but all guinea pigs became infected Bacilli were readily detected in mice two weeks after infection and were numerous after four weeks Doses of 10^{-4} and 10^{-5} mgm. produced growth on all culture tubes, and bacilli were numerous in mice two weeks after infection. Bovine tubercle bacilli multiplied rather more rapidly than human tubercle bacilli in mice

Myco phlei and four other strains of saprophytic acid-fast bacilli were injected in doses of 10^{-2} to 10^{-4} mgm. With the larger doses, smears from the inoculum revealed many acid-fast bacilli and these were, of course, detected in mice two weeks later After four weeks there were, however, slightly fewer bacilli With doses of 10^{-4} mgm very few bacilli were seen at all, the results were therefore very different from those obtained with virulent tubercle bacilli

In this work three separate laboratory strains of white mice, maintained on stock diets, have all been equally susceptible Mice varying in age from three weeks to 'adult' were used, and although the young mice appeared to be slightly more susceptible, the difference was considered to be unimportant.

No evidence has been obtained to conflict with the view that it is difficult to produce generalized tuberculosis in mice following subcutaneous infection, but the foregoing results indicate that, if smears are made from the site of inoculation, it may be possible to use mice for the routine detection of small numbers of virulent tubercle bacilli. The method is now being tried on clinical material

Larvæ of *Sphaerophoria* as Predators on Thrips in South Africa

IN an earlier paper[1] attention was directed to the fact that thrips have remarkably few effective natural enemies. Syrphidae were mentioned as predators, but the thrips-feeding habit seems to be very rare in these insects, the larvæ of most of the entomophagous forms feeding on aphids and other Homoptera Some Syrphid larvæ, however, are known to prey on other insects, such as caterpillars, but there seem to be scarcely any records of species feeding on thrips Where thrips are rather inactive and congregated in numbers on leaves or in galls, they would seem to be more liable to attack by predators such as Syrphid larvæ

At Grahamstown, Cape Province, South Africa, larvæ of the Syrphid fly, *Sphaerophoria quadrituberculata* Bezzi (Diptera, Syrphidae), were observed feeding on the immature stages of the thrips, *Cercothrips afer* Priesner, in curled leaves of a plant originally thought to be *Ficus burtt-davyi* Hutch., but now identified as *Ficus craterostoma* Warburg. All the Syrphid larvæ found were in the third or final instar, and were nearly fully grown. They were kept in glass dishes in the laboratory and supplied with thrips several times a day. The thrips larvæ, prepupæ and pupæ were eaten voraciously, the Syrphid larvæ striking out vigorously in all directions until contact was established with the prey, but the adult thrips were not attacked This appears to be the first record in Africa of the thrips-feeding habit in Syrphidae Prof. J. C. Faure, Dr E. K Hartwig and Mr. J C Jacot-Guillarmod kindly inform me (*in litt*, 1954) that they have never observed or know of any records of Syrphid larvæ feeding on thrips in South Africa.

Cercothrips afer is large for a thrips and is a most conspicuous species. The immature stages are bright red, whereas the adults are black and attain a length of 7 mm Although this thrips may occur in considerable numbers in the curled leaves of *F craterostoma*, it lives there as an inquiline, and is not in any way responsible for the curling Actually the curling of the leaves results from the feeding activities of another and smaller thrips, *Gynaikothrips hirsutus* (Karny) This thrips, too, is often very numerous in such curled leaves, which can really be termed open galls, for the inward rolling of the edges of the leaves is accompanied by marked hypertrophy of the plant tissue Both thrips have been recorded previously from South Africa Jacot-Guillarmod[2] found *Cercothrips* associated with *Gynaikothrips* on *Ficus petersii* Warburg in Natal, but, although he suggested the curling of the leaves was probably due to the latter species, he did not state definitely that *Cercothrips* lives as an inquiline in the curled leaves. My observations leave no doubt as to the respective parts played by the two species of thrips

Although the Syrphidae include some of the most important of beneficial insects, they have as yet been little studied in Africa As in other parts of the world, however, the larvæ of the entomophagous species will probably be found to be mainly aphidophagous. The genus *Sphaerophoria* is world-wide in distribution, and its larvæ are known to be predators on aphids and other homopterous insects Only two species of *Sphaerophoria* appear to have been recorded so far from the Ethiopian region *Sphaerophoria quadrituberculata* is a remarkable species It was described by Bezzi[3] in 1915 from Durban, Natal, but does not seem to have been found since. The males are unusual in having a pair of large, conspicuous, raised tubercles on both the third and fourth tergites of the abdomen, to which the specific name directs attention. The structure of the immature stages, described recently by Stuckenberg[4], is equally remarkable, and the thrips-feeding habit of the larvæ is exceptional The feeding habits of this species were hitherto unknown. Curled leaves present a highly specialized environment, and it would be interesting to know if the larvæ of this Syrphid occur in habitats other than galls and prey on insects other than thrips. It seems not unlikely, however, that the larvæ of this species are restricted to this ecological niche in curled leaves and feed exclusively on thrips

I am grateful to Mr C. F. Jacot-Guillarmod for naming the two species of thrips, and to Dr. L. E. W. Codd for the identification of *Ficus craterostoma* Mr. B. R. Stuckenberg kindly identified the Syrphid and described its immature stages, which were previously unknown

Alkaline-Earth Borohydrides and their Applications in Organic Syntheses

WE have pointed out that the alkaline-earth metal borohydrides discovered by us are very suitable for the reduction of ketones and aldehydes to the corresponding alcohols[1] The present communication deals with the application of these borohydrides—particularly of $Ca(BH_4)_2$—for reduction of other functional groups

The most important of these applications is the reduction of carboxylic acid esters to primary alcohols We have been able to reduce a great number of aliphatic and aromatic carboxylic esters, generally in excellent yields, by means of calcium borohydride. For example, we have reduced the following esters to the corresponding carbinols (yields in parentheses) ethyl *p*-nitrobenzoate (96 per cent), ethyl phenylacetate (90 per cent), ethyl glycinate (70 per cent), ethyl alaninate (73 per cent), threo ethyl *p*-nitrophenylserinate (88 per cent), for this last reduction, lithium–aluminium hydride is quite unsuitable[2].

The azlactones, too, proved to be well suited for reduction by the aid of calcium borohydride[3], 2-phenyl-4-benzyliden-oxazol-5-one gave α-benzoylaminocinnamyl alcohol

The above-mentioned reductions can be carried out with solutions of calcium borohydride in hydroxyl-free solvents (tetrahydrofurane), but the alcoholic solutions prepared by the metathesis of sodium borohydride and calcium chloride are equally suitable In alcoholic medium, of course, to avoid the alcoholytic decomposition of the calcium borohydride, the temperature must be kept between about −20° and −10° C (Esters with smaller reactivity are not reducible in alcoholic solution)

It is very interesting that the reductions can also be successfully carried out in solvents of high water content (for example, in 50 per cent alcohol) provided that the temperatures employed are sufficiently low; thus threo ethyl-β-phenylserinate and ethyl *p*-nitrobenzoate are reducible in 50 per cent ethanol with good yields The reductions are generally completed in 4–10 hr.

If required, it is possible to work in a hydroxyl-free solvent by the following technique · the solution of the ester in tetrahydrofurane is stirred for some hours with a mixture of calcium iodide and sodium borohydride at a temperature between 0° and 25° C, or, if necessary, at higher temperature. Obviously the reducing agent is 'nascent' calcium borohydride

We have developed further methods for preparing the alkaline-earth metal borohydrides in solid form For example, calcium borohydride can be obtained from the reaction of anhydrous calcium chloride and sodium borohydride in tetrahydrofurane. The reaction requires 4–8 hr and thorough stirring (with a magnetic stirrer or a ball mill) The solution contains, after the sodium chloride has been centrifuged off, calcium borohydride of fairly good purity. (With such solutions esters with smaller reactivity, such as ethyl benzoate, are also reducible) The solution gives on evaporation *in vacuo* a crystalline tetrahydrofurane addition compound of calcium borohydride

The reducing properties of strontium or barium borohydrides are very similar to those of calcium borohydride

Our experimental results indicate that the calcium borohydride and other alkaline-earth metal borohydrides are reducing agents of higher reducing activity than the other borohydrides hitherto used for reduction purposes, namely, the borohydrides of sodium, potassium and lithium This may be ascribed perhaps to the more covalent character of these compounds

The general opinion, that esters are not reducible with sodium or potassium borohydride[4], must be corrected In our experiments, we succeeded in reducing some esters with sodium and lithium borohydrides in alcoholic solution to primary alcohols in excellent yields Nevertheless, some esters, which are readily reduced by alkaline-earth borohydrides are not reducible by means of lithium or sodium borohydrides under similar conditions

The alkaline-earth metal borohydrides are, in our opinion, among the most important reducing agents. They are suitable for the reduction of esters to primary carbinols, a reaction which is regarded as the most important function of lithium–aluminium hydride In addition, the alkaline-earth borohydrides have a combination of features which is unique · solvents with hydroxyl groups (for example, ethanol, water) may be used, the selectivity of the reductions is greater than in the case of lithium–aluminium hydride, there is no danger of explosion and ignition as contrasted with the latter, compounds sensitive to alkalis can also be reduced, as the solutions of alkaline-earth borohydrides are nearly neutral

We believe that these compounds have good promise *inter alia*, in the study of several groups of natural products, such as the proteins, polypeptides (determination of C-terminal residues[5]), sugar derivatives and polysaccharides

A detailed account of this work will be published elsewhere

Inhibition of the First Limit of the Hydrogen – Oxygen Reaction by Ethane

A STUDY of the inhibiting action of ethane on the second limit of the hydrogen–oxygen reaction in vessels coated with potassium chloride[1] shows that the main features of the inhibition are essentially similar to those reported for propane[2]. The reduction in explosion pressure with increasing mole fraction of ethane is almost exactly linear, and the quantity of inhibitor ($i_{1/2}$) required to halve the explosion pressure is approximately proportional to the mole fraction of oxygen, and approximately independent of the mole fraction of hydrogen, vessel diameter, and vessel surface As in the case of propane, these main facts can be explained by introducing a termination reaction between hydrogen atoms and the hydrocarbon

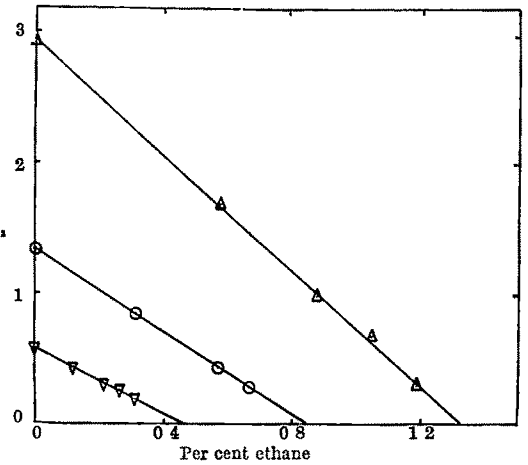

Fig 1 36 mm diameter potassium chloride-coated vessel Temperature 540° C Mole fraction hydrogen, 0 28 Mole fraction oxygen (y) = 0 56 △ , y = 0 28 ○ , y = 0 14 ▽

into the accepted mechanism for the uninhibited second limit[3], when the relation obtained is

$$i_{1/2} = k_1y/k_2, \qquad (\text{i})$$

where y is the mole fraction of oxygen, and k_1, k_2 are the velocity constants of reactions (1) and (2)

$$H + O_2 = OH + O \qquad (1)$$

$$H + C_2H_6 = C_2H_5 + H_2 \qquad (2)$$

This treatment assumes that every radical produced n reaction (2) is destroyed without chain propagation, allowance for this assumption can be made by ntroducing a term Q, the fraction of ethyl radicals destroyed without chain propagation, into the denominator of equation (i) As with propane, second-limit results give no indication of any significant variation of Q with mixture composition, vessel diameter or vessel surface, and the fate of the ethyl radicals thus remains uncertain

In an attempt to examine the fate of the ethyl radicals at low pressures, the inhibition of the first limit by ethane was investigated A simple expression can be obtained if the following assumptions are made (a) only hydrogen atoms are destroyed at he vessel surface, (b) this surface destruction is fficient, and is thus inversely dependent on the pressure ($k_H = A/P$), (c) gas phase termination hrough the termolecular formation of HO_2 is negligible, (d) reaction of oxygen atoms and hydroxyl adicals with ethane can be neglected The expression hen obtained is

$$2k_1y = k_2iQ' + A/P^2, \qquad (\text{ii})$$

where Q' is the fraction of ethyl radicals destroyed without chain propagation at first-limit pressures

Table 1

Hydrogen	Mole fraction Oxygen	Nitrogen	Ratio $I/2i_{1/2} = Q/Q'$
0 28	0 14	0 58	0 87
0 28	0 28	0 44	0 98
0 28	0 56	0 16	0 99
0 44	0 56	—	0 93
0 14	0 56	0 30	0 97
0 10	0 56	0 34	0 98
0 07	0 56	0 37	1 04
0 56	0 14	0 30	0 80
0 14	0 14	0 72	0 87
0 07	0 14	0 79	0 84

Fig 1 shows the linear relation obtained when $1/P^2$ is plotted against i The intercept when $1/P^2 = 0$ is given by $I = 2k_1y/k_2Q'$, and the ratio $I/2i_{1/2}$ thus gives Q/Q'. Table 1 gives this ratio for a wide variety of mixtures, and shows that Q/Q' is effectively constant, and equal to unity Since the first-limit measurements cover the pressure range 5–20 mm mercury, while the second-limit measurements cover the range 50–100 mm. mercury, it may be concluded that over the whole of this pressure-range the fraction of ethyl radicals destroyed is effectively constant

The combination of first- and second-limit results thus suggests that Q is independent of pressure, mixture composition, vessel diameter and vessel surface It is concluded that the ultimate termination reaction is

$$C_2H_5 + O_2 = C_2H_4 + HO_2, \qquad (3)$$

and in consequence, the only possible competing chain propagation reaction can be a reaction with oxygen such as

$$C_2H_5 + O_2 = CH_3CHO + OH, \qquad (4)$$

the fraction Q then being given by

$$Q = k_3/(k_3 + k_4)$$

The high yields (up to 80 per cent) of ethylene obtained in the oxidation of ethane at these temperatures[4], as well as the kinetic facts (Baldwin, R R , and Simmons, R F , unpublished work), require reaction (3) to be at least as fast as reaction (4)

A detailed treatment, in which allowance is made for the assumptions (a)–(d) above, confirms these conclusions, and will be published shortly

Photosensitivity of Iron Chelates

During work with iron chelates, it was noted that many chemical analyses for total iron were inconsistent when repeated at intervals on solutions left standing on the laboratory bench in the light. A sensitive method was then devised for the estimation of the chelated iron molecule as a whole, based on the light-absorption of solutions in the ultra-violet region Dilute solutions (approximately 0 0001 M) of the di-sodium iron ethylenediaminetetracetate have an absorption curve with a maximum at about 260 mμ This peak is well separated from, and is much more pronounced than, that of the di-sodium ethylenediaminetetracetate itself at about 210 mμ Therefore, the optical density at 260 mμ, as determined by a spectrophotometer, was used as a measure of the chelated iron present in solutions of the di-sodium iron compound

Solutions of two other iron chelates, namely, those with diethylenetriamminepentacetic acid and with N-hydroxyethylethylenediamminetriacetic acid, can be analysed similarly by determining optical densities at their ultra-violet maxima of about 260 mμ and 245 mμ respectively. It has been noted by using the above method that solutions of these three iron chelates, although they are completely stable in the dark, are decomposed on exposure to daylight, thereby accounting for the inconsistent chemical analyses mentioned above

Other metal chelate solutions tested so far, namely, those of copper and nickel with ethylenediamminetetracetate, are stable in light

The photosensitivity of di-sodium iron ethylenediamminetetracetate has been noted previously by Jones and Long[1] , but this important point seems to have been overlooked by biologists The proposed scheme for this decomposition, as published[1], is

(i) Ferric-EDTA + light $\longrightarrow$ Ferrous-EDTA + decomposition products of EDTA

(ii) Ferrous-EDTA + $\frac{1}{2}$ H_2O + $\frac{1}{4}$ O_2 $\longrightarrow$ Ferric-EDTA + OH'

(iii) By repeated photoreduction and subsequent re-oxidation, sufficient hydroxyl ions are released to form the hydroxy-compound, Fe(OH)EDTA, and finally to precipitate ferric hydroxide

Results I have obtained with the ultra-violet absorption method on solutions of di-sodium iron ethylenediamminetetracetate exposed to light are in accord with the above scheme, except that no decomposition of the ethylenediamminetetracetate molecule has been recorded. It is therefore of prime importance in quantitative laboratory experiments that solutions of these iron chelates should be protected from the action of light

Another practical point is that vessels in which solutions of iron chelates have been decomposed by light acquire a tenacious deposit of iron hydroxide This deposit is best removed by an acid rinse, being little affected by the normal wash with water and detergent

The three iron chelates mentioned above have been used as a source of iron for plants[2,3] Their mode of action is not understood, but it is thought that plants absorb through their roots the whole chelate molecule and translocate it intact[4] There is, however, no evidence to show how plants obtain the iron from this very stable complex (log K of the ferric compound = 25 1 [5]) It has been postulated that the iron is only released after the ethylenediamminetetracetate has been partially metabolized[6] , alternatively, a more stable complex would have to be formed

In view of the photosensitivity of iron chelates a further possibility arises, namely, that reduction takes place within the plant leaves, to give the less-stable ferrous compound (log K = 14 2 [5]) Then the iron in this form could be removed more readily by complex-formation with proteins or could be replaced by some other metal ions, for example, copper and zinc

Further experiments are in progress to test the significance of the photosensitivity of iron chelates in plant nutrition and these will be reported later

Deposit of Spheroidal Graphite

THE superior mechanical properties of nodular cast iron, in comparison with other cast iron, are believed to be due to the graphite which is present in a spheroidal form. Small additions of various metals, and suitable heat treatment, induce or inhibit the formation of this variety of graphite, and recently the presence of hydrogen in the gas atmosphere has been demonstrated to have a marked influence[1]. No generally accepted explanation of this phenomenon has been advanced , but several investigators have suggested that the presence of foreign particles is necessary in order to induce nucleation or growth of the spherulites by an epitaxis or by screw dislocation mechanism[2]

During experiments whereby small samples of refractory materials were heated in a wire-wound mullite tube furnace in a moisture-free town's-gas atmosphere at temperatures varying from 1,100° to 1,600° C , the samples were found to be coated with

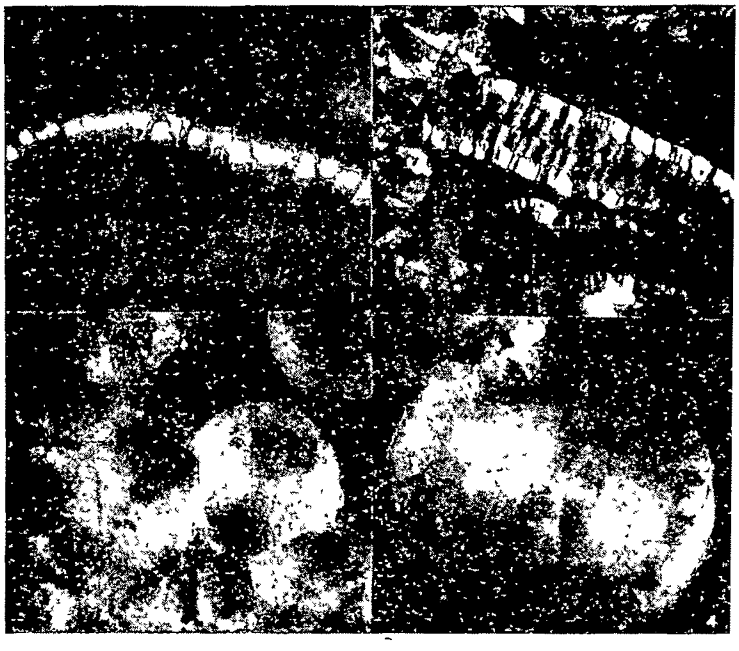

Fig 1 Typical filament × 315

Fig 2 Longitudinal section of a filament × 350 (reflected light, crossed nicols)

Fig 3 Cross-section of botryoidal structure × 720 (polarized light)

Fig 4 Cross-section of individual sphere × 720 (polarized light)

a deposit of graphite which was composed entirely of spheroids in botryoidal and filamentous aggregates. Microscopic examination revealed that the filaments were composed of a string of spheres or sections of spheres, remarkably similar to the spherulites in the nodular cast iron[3].

Fig. 1 shows a typical filament and Fig. 2 shows a longitudinal section. Figs. 3 and 4 are cross-sections of a botryoidal structure and of an individual spheroidal structure respectively. On the surface of many of the spheres, spiral structures were observed and photographed. These were particularly abundant in the botryoidal masses.

X-ray examination gave a pattern of graphite.

Geological Ages of Witwatersrand Uraninites

THE origin of the gold and the uranium in the conglomerates of the Witwatersrand system is a much-disputed problem. Two main schools of thought seem to have emerged, namely, the adherents to a placer hypothesis and those who support a hydrothermal theory of origin. Geological age determinations on Witwatersrand uraninites would yield valuable information to geologists concerned with this problem, since it is universally agreed that this system is of sedimentary origin and a maximum possible age for the system as a whole can be arrived at from field observations.

Davidson[1] undertook an age study on a sample of Witwatersrand uraninite by the lead-isotope method and obtained age values which at first could not satisfy the requirements of a hydrothermal theory of origin unless the Witwatersrand system was about twice as old as geologists were willing to believe, and thus considerably older than any other known sedimentary system. Subsequent geological age determinations on this same sample were made by J. L. Kulp[2,3] and Collins, Farquhar and Russell[4]. Further views on these results by Davidson[5] tend to reconcile the calculated most probable age with a hydrothermal theory of origin, which required a uraninite age younger than the possible maximum age of the sedimentary system. Geologists possessing an intimate knowledge of the Witwatersrand put the maximum possible age of this system at about 1,000 million years, whereas the age calculations of Davidson have successively decreased the most probable age from about 1,700 million years to between 465 and 816 million years. These figures were arrived at without undertaking a further study of more uraninite samples from this system.

The Witwatersrand system, in the type area, is some 25,000 ft. thick and its horizontal extent stretches over a 'strike' of about 150 miles. For this reason, no far-reaching conclusions should be drawn from the results of the study of a single, isolated sample of uraninite concentrate.

I have completed age analyses on ten samples of uraninite concentrates, three 'carbon' (thucholite) concentrates and two samples of uranium-rich 'carbon' ores according to the lead-isotope method, in conjunction with which four galena samples were analysed for their lead isotopic patterns. The samples were chosen to represent almost all the different recognized series of the system, and in horizontal extent the entire existing mining area was covered. A study of the patterns of apparent ages calculated from the RaG/UI, AcD/AcU and the AcD/RaG relations indicated that in most cases a loss of radon of between 5 and 27 per cent should have occurred while in other cases the discrepancies in apparent ages of a particular sample could be explained by assuming a loss of uranium, or a loss of lead, or additions of old radiogenic lead, sometimes in addition to loss of radon. These conclusions were drawn after the manner of Holmes[6]. It is thus clear that the Witwatersrand uraninites are, strictly speaking, unsuitable material for accurate age determinations.

Nevertheless, a study of the apparent ages and radiogenic lead-isotope patterns found for the suite of samples as a group indicates that all the uraninites of the Witwatersrand system proper probably have the same geochemical and mineralogical history. The results seem to justify the conclusion that all these uraninites have a true age of between 1,850 and 1,950 million years, and that this mineral was therefore introduced into the Witwatersrand sedimentary beds as a detritus, being derived by an erosion process from an ancient source. Evidence of some form of reworking in the sedimentary system, after its deposition and consolidation, is proved by the admixture of radiogenic lead found in a galena which occurred as isolated large and perfect crystals and by the signs

Table 1

Sample	Pb^{204}/Pb^{206} (per cent)	Estimated radiogenic Pb (per cent)	AcD/RaG (per cent)	t_{UI}	t_{AcU}	$t_{\frac{AcD}{RaG}}$	Preferred age (Figures in brackets doubtful)

of loss of uranium from some uraninites found in 'carbon'

Uraninite from the Black Reef, which is composed of the erosion products of the Witwatersrand system, indicated a loss of uranium, which implied that the mineral was unable completely to survive this secondary erosion process. The survival of the original uraninites during their alluvial transportation period may, however, be explained if it is postulated that the earth's atmosphere at the time of the deposition of the Witwatersrand system was of a reducing (or at least a neutral) nature (with all the geochemical implications of such a postulate) as opposed to the oxidizing nature of the present atmosphere. According to Urey[7], the postulated transition could have occurred not much later than about 800 million years ago

Some of the most pertinent data obtained in this study are given in Table 1, where the samples are arranged in stratigraphical order and ages are given in millions of years

A full account of this work and a more complete discussion of the reliability of the results and their implications will be published in the forthcoming issue of the *Transactions of the Geological Society of South Africa*, 57

Proposal for a New Æther Drift Experiment

Furth[1] has recently suggested a repetition of the Michelson–Morley experiment using microwaves and attempting to detect the change in resonant frequency of a cavity as it is rotated through 90° Essen[2] proposes that any change in the resonant frequency of the cavity be detected by using the cavity to control an oscillator the frequency of which is compared with that of a quartz standard, and estimates that a change in resonant frequency of one part in 10^{10} might be detectable

If instead of the cavity being used to control the oscillator frequency, as in Essen's method, it is used to produce a phase change in a signal from a fixed-frequency oscillator, greater sensitivity can be obtained

The method is demonstrated in principle in Fig 1 The output of an oscillator operating at the resonant frequency of the cavity is split into two branches, one of which contains the rotating cavity the other a broad-band 90° phase-shifter Thes two branches feed a phase-sensitive detector followe by a tuned amplifier and output indicator Th auxiliary feedback circuit shown in dotted line maintains the oscillator at the mean resonant fre quency of the cavity As will be shown later, th refinement may not be necessary

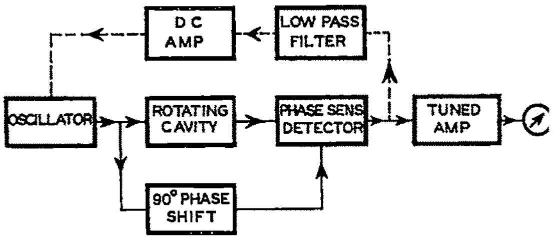

Fig 1

Let a rotation of the cavity through 90° produce change Δf in the resonant frequency of the cavity which is assumed to be resonant initially at th oscillator frequency f. Then the change in phas $\Delta\varphi$ on passing through the cavity will be $\Delta\varphi =$ $2Q \ \Delta f/f$, Q being the quality factor of the cavity Thus, since we are dealing with very small values $\Delta\varphi$, the detector output amplitude will vary a $\cos(\pi/2 + \Delta\varphi) \approx -(\Delta\varphi)$

If the cavity is rotated continuously, then an effects due to æther drift will appear twice eac revolution. Thus if the amplifier is tuned to twic the rotation frequency and has a narrow band-widt changes due to random drifts in frequency and t vibration, at other than twice the rotation frequenc will be eliminated A suitable means of obtaining narrow band-width would be the use of a synchronou rectifier switched at twice the rotation frequency followed by a low-pass filter

An estimate of the minimum detectable change frequency $\Delta f/f$ may be made as follows. If th resonator output power is P_r, then the output the detector will be $P \propto P_r(\Delta\varphi)^2$ Assuming th detector and amplifier have a noise factor N and ban width B, and that the minimum detectable power equal to the noise power, the minimum detectabl value of $\Delta f/f$ is

$$\frac{1}{2Q}\sqrt{\frac{NkTB}{P_r}}\,, \qquad (1$$

where k is Boltzmann's constant and T the absolut temperature As an example, consider a 10,000 Mc / cavity of $Q = 10^4$, an input power to the detecto $P_r = 10^{-3}$ W., a noise factor $N = 20$, a band-widt $B = 1$ c/s, and temperature $T = 300°$ K. The the minimum detectable value of $\Delta f/f$ is 5×10^{-1} an improvement of 200 times on the method suggeste by Essen. The value of N used here is appropriat to a superheterodyne system based on Fig 1. Fo simplicity the frequency-changing stages have bee omitted from Fig 1 In principle, the sensitivit can be increased without limit by reducing th amplifier band-width B

The basic advantage of the method suggested her over those which involve a measurement of fre quency-differenc is that it is a phase-differenc between signals from the same source which measured Thus the stability of the source is no particularly important, provided that its frequenc remains within a region less than f/Q If the inpu signal is such that a phase difference of φ occurs the cavity, and rotation of the cavity produces a further periodic phase change $\Delta\varphi$, then the detector output power is proportional to $[\sin(\varphi + \Delta\varphi) - \sin\varphi]^2 = [\cos\varphi \sin\Delta\varphi]^2$. Hence, when $\varphi < \pi/4$, the reduction in sensitivity is small. Because $\Delta\varphi$ is periodic, it will be amplified, whereas accidental changes in phase-angle uncorrelated with $\Delta\varphi$ will be suppressed.

While not strictly relevant to Furth's suggestion, it is worth noting that the method suggested here is applicable to experiments such as those of Wood, Tomlinson and Essen[3], if the cavity is replaced by a quartz resonator. This should result in a considerable increase in sensitivity because of (*a*) the higher Q obtainable, (*b*) the ability to apply larger powers to the detector, and (*c*) the lower noise figures realizable at lower frequencies. As an example, consider a quartz resonator with frequency 100 kc./s. having $Q = 2 \times 10^5$, $P_r = 10$ mW., and $N = 2$, other parameters being as before. The minimum detectable $\Delta f/f$ is approximately $2·5 \times 10^{-15}$.

Use of Soluble Filter Gauzes

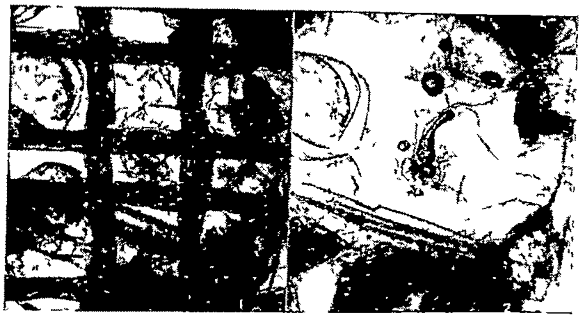
IN connexion with filtration problems in agricultural spraying machinery, we have been making a study of the nature and quantity of matter in natural waters capable of being retained on filter gauzes. We found it necessary to develop a technique for this purpose which we think may be of interest in biological investigations.

Removal of the material from the gauze for microscopic examination is not satisfactory, as it cannot be assumed that a fair sample is removed or that delicate structures are not damaged. We therefore replaced the metal gauze by one of cellulose acetate, with the intention of dissolving away the filter base after transfer to a microscope slide. The filtered matter, mainly mineral and cellulose structures, could be left *in situ* undissolved and clearly visible.

To simulate 100-mesh wire gauze, an acetate fabric was kindly supplied by Messrs. Courtaulds consisting of 45-denier 10-filament (continuous) yarn with 30 turns to the inch woven with 92 warps and 84 wefts per inch.

400 ml. of water was found to give a convenient amount of deposit on a $B14$ cone (area $= 0·44$ sq. cm.). The part of the mesh containing the deposit was carefully cut out and mounted on a microscope slide. The presence of water on the yarn as well as in the organic matter gave rise to a cloudiness on dissolving the acetate mesh directly in acetone. It was therefore found necessary to dehydrate the specimen by successive washes in 30, 70 and 100 per cent ethanol before applying the acetone. The alcohol and acetone were introduced at the edge of the specimen and allowed to flow across by holding the slide obliquely. A cover slip was placed over the esidue before the acetone had evaporated.

Figs. 1 and 2 are photographs of the same deposit taken before and after dissolving the filter. These illustrate the greater detail visible when the filter is removed, both as regards absence of the fibres of fabric and also because of the greater ease with which the image can be focused. There is little disturbance of the disposition of the residue in the process except for some shrinkage in the diameter of filamentous matter and slight movement due to surface tension effects.



The colour of algae is sufficiently well retained during the solvent treatment to enable them to be clearly distinguished from colourless structures.

Thanks are due to Dr. G. S. Hartley for suggesting this method, and to the Board of Pest Control, Ltd., for permission to publish this work.

Method for Recovery of Metallic Grids for Electron Microscopy

THE metallic grids used as supports for the parlodion films containing material for electron microscopy are usually rejected after use. Good results in recovering these grids were obtained by the use of the following technique, which is a modification of one previously described[1].

Initially, the grids are washed with hot distilled water to dissolve soluble salts. The film of oil from the diffusion pump is removed by boiling the grids in a 0·1 per cent soap or any detergent solution for half to one hour and leaving them to stand in contact with the soap solution for a day at room temperature. The soap is then removed by washing with hot distilled water, followed by another washing with acetone to ensure complete removal of any residual oil. After treatment with acetone, the grids are placed in contact with approximately 1 N hydrochloric acid solution at 30–40° C. to remove the products of corrosion of the grids. The time of contact with the acid solution depends on the metal (less for copper and more for nickel grids) and also on the degree of corrosion. Generally, after no more than ten or twenty minutes, all grids present a clear bright surface and the acid solution can be poured off. The clean grids are then carefully washed with boiling distilled water to remove all traces of acid and dried at 100–120° C. protected from dust. The cleanliness of the grids can be checked by optical or electron microscopical examination, but it is not necessary. It was found that a small can, open on the top and having about twenty holes drilled in the bottom, is very convenient for washing the grids with water and acetone. Generally, ten washings were sufficient to ensure complete removal of the cleaning solutions

The more dilute solutions of soap and especially of hydrochloric acid give better results than concentrated ones, as described before[1], because no close control of the time of contact between the grids and the cleaning solutions was necessary.

This method of cleaning used grids has some advantages over the flambage cleaning method proposed by Eaves[2], because it does not make them friable nor does it destroy copper grids, as pointed out by Eaves, however, it does involve much more material and time

Use of Methyl Cellulose Gel as a Substitute for Agar in Tissue-Culture Overlays

IN the course of experiments designed to assay non-cytopathogenic animal viruses by Dulbecco's plaque-count method[1] using fluorescent antibody[2] to identify the plaques, a non-fluorescent substitute was required for the agar used in the overlay Methyl cellulose has been used by Earle[3] to increase the viscosity of tissue-culture fluids for suspended-cell cultures, and appears to be harmless to animal tissue. An investigation of its properties showed it to be capable of forming highly viscous aqueous solutions which would gel spontaneously on raising their temperature The presence of salts at physiological concentrations lowers the temperature of gelation Thus one can make a solution of methyl cellulose containing tissue nutrients which, after being added as a liquid at room temperature to the tissue, will set quite firmly soon after being placed in an incubator at 37° C. A further advantage is that this overlay can be removed entirely without disturbing the tissue, this is achieved by cooling the culture in a refrigerator for a short time, during which the gel liquefies, enabling it to be removed by pipetting

The following procedure was used for obtaining 'bare' plaques of fowl-plague virus entirely free from overlay. Petri-dish tissue cultures of chick tissue monolayers were made by Dulbecco's method[1], and infected, 5 ml of 1·5 per cent methyl cellulose overlay was poured on to each infected plate and incubation continued for a further three days The overlay was prepared as follows 1·5 gm methyl cellulose of 4,000 centipoises viscosity (Dow Chemical Co) (previously thoroughly washed with alcohol and ether) was added to 15 ml. de-ionized distilled water at 100° C in a 250-ml conical flask The flask was shaken to disperse the methyl cellulose (which is insoluble at this temperature) and immediately autoclaved After removal (still hot) from the autoclave, a warm sterile mixture of 5 ml four-fold Earle's saline[4] and 80 ml synthetic medium (Waymouth, C, personal communication) containing antibiotics was added and thoroughly mixed On cooling rapidly with agitation, the methyl cellulose dissolved to give a clear viscous solution This was stored frozen at – 20° C.

Following incubation of Petri-dish cultures, the overlay was pipetted off after adding 10 ml. of phosphate-buffered saline at 0° C. to each plate, and chilling for $\frac{1}{2}$ hr. The cultures were rinsed with more phosphate saline and were then available for staining for 10 min with vital stain, or other treatment

Under this overlay, plaques due to fowl plague virus take three days to become visible, whereas under agar only two days are required. This is believed to be due to a lower rate of diffusion of the virus in the methyl cellulose overlay, tests have indicated that the latter has no inhibitory or inactivating effect upon this virus.

Advantages of methyl cellulose overlay over agar are (1) non-fluorescence, (2) simpler handling after a stock is made up, (3) overlay can be completely removed, (4) complete absence of toxicity on cells

Disadvantages of the method are (1) plaques take longer to form, (2) stock solutions are more difficult to prepare, (3) gel is much weaker than that obtained with agar of equivalent concentration.

A few experiments have been made with methyl cellulose gel for other uses in tissue culture It may be used as a substitute for plasma clot, but seems inferior to the latter as judged by the rate of increase in size of outgrowths from explants. Tests indicate that such gels have useful applications in bacteriology, these are under investigation.

Preservation of Dogfish

IN institutions where dogfish are used for dissection, the preservative most commonly employed is a solution of formaldehyde in water. Formaldehyde is a good preservative, but its volatile and pungent character makes its use in the class-room and the store-room a matter of disagreeable compulsion

Experiments first started in 1939 to find a suitable storage fluid to replace formaldehyde showed that pine oil compounds possessed many advantages in checking the growth of bacteria and fungi 'Perminal KB' is a pine oil emulsion produced by Imperial Chemical Industries, Ltd, to assist in the kier boiling of cotton—as a solvent for fats and waxes, and as an emulsifying agent. When diluted with water it is an excellent preserving fluid for dogfish which have been fixed in formaldehyde The steps are as follows: (1) wash the fixed dogfish in water overnight to remove the formaldehyde, (2) place in 'Perminal KB' 10 c c, water 90 c.c, rinse the specimens under the tap before dissection

Dogfish so treated have been kept in this solution for more than five years without evidence of deterioration, but it should be emphasized that this method is of use only with fixed material Fresh, unfixed material placed in this solution will decompose

Royal Society of Arts (at John Adam Street, Adelphi, London, W C 2), at 2 30 p m—Mr F C Bawden, F R S "Virus Diseases of Plants" (Fernhurst Lecture)

Physical Society, Colour Group (at the Institute of Ophthalmology, Judd Street, London, W C 1), at 3 30 p m—Mr T H Vinnicombe "The Robbialac Colorizer Method of Paint-Colour Mixing and its Value to All Concerned in the Usage of Colour"

Geological Society of London (at Burlington House, Piccadilly, London, W 1), at 5 p m—Mr R G West and Mr J J Donner "The Glaciations of East Anglia and the East Midlands, a differentiation based on Stone Orientation Measurements of the Tills"

Royal Society of Medicine, Endocrinology Section (at 1 Wimpole Street, London, W 1), at 5 p m—Discussion on "Hormones and Cancer" Opening Speakers Sir Stanford Cade and Sir Charles Dodds

Institution of Electrical Engineers, Supply Section (at Savoy Place, London, W C 2), at 5 30 p m—Mr Å Rusck "High-Voltage Transmission Developments in Sweden"

British Institution of Radio Engineers (at the London School of Hygiene and Tropical Medicine, Keppel Street, Gower Street, London, W C 1), at 6 30 p m—Mr R K Vinycomb "A Versatile Electronic Engine Indicator"

Society of Chemical Industry (joint meeting of the Food and Microbiology Groups, in the Rooms of the Chemical Society, Burlington House, Piccadilly, London, W 1), at 6 30 p m—Mr D H F Clayson "Food Perishability in Terms of Micro-ecology"

Royal Institute of Chemistry (at Norwood Technical College, Knights Hill, West Norwood) at 7 p m—Dr Tudor S G Jones: "Chromatography Theory and Some Applications"

Thursday, February 24

Royal Society (at Burlington House, Piccadilly, London, W 1), at 4 30 p m—Prof Wilson Smith, F R S, Mr G Belyavin and Mr F W Sheffield "The Host Tissue Component of Influenza Viruses", Mr R Halliday "The Absorption of Antibodies from Immune Sera by the Gut of a Young Rat"

London Mathematical Society (at the Royal Astronomical Society, Burlington House, Piccadilly, London, W 1), at 5 p m—Prof A G Walker "Tangent Planes"

Institute of Refrigeration (at the Institution of Mechanical Engineers, 1 Birdcage Walk, Westminster, London, S W 1), at 5 30 p m—Mr G Yate Pitts "Sub-soil Temperatures and Frost-heave"

University of London, British Postgraduate Medical Federation (at the London School of Hygiene and Tropical Medicine, Keppel Street, London, W C 1), at 5 30 p m—Dr R A Kekwick, "The Plasma Proteins" * (From a series of lectures on "The Scientific Basis of Medicine")

Friday, February 25

Association of Applied Biologists (at Imperial College, Imperial Institute Road, London, S W 7), at 10 45 a m—Scientific Papers

Royal Meteorological Society (joint meeting with the Royal Astronomical Society, at Burlington House, Piccadilly, London, W 1), at 2 30 p m Discussion on "Hydrodynamical Processes in Meteorology and Geophysics"

Physical Society (in the Lecture Theatre, Science Museum, South Kensington, London, S W 7), at 5 p m—Dr W S Stiles "The Basic Data of Colour-Matching and some related Aspects of Visual Theory" (Thomas Young Oration)

Royal Institution (at 21 Albemarle Street, London, W 1), at 9 p m—Dr Eric Ashby "A Procession of Flowers"

Saturday, February 26

Association of Scientific Workers (in co-operation with the Education Committee of the London Co-operative Society, at the Central Hall, Westminster, London, S W 1), at 2 30 p m—Prof C H. Powell, F R S "The H-bomb"

APPOINTMENTS VACANT

Applications are invited for the following appointments on or before the dates mentioned

Senior Biologist in the Chief Engineer's Department, British Electricity Authority, to take charge of a small biological laboratory situated in North London and undertake research and advise the Authority on the effects of power station operation upon the life of rivers and other waterways—Director of Establishments, British Electricity Authority, Winsley Street, London, W 1, quoting AE/568 (February 25)

Scientific Officer (with a first- or second-class honours degree in engineering or equivalent qualification, and workshop training or apprenticeship) in the Department of Scientific and Industrial Research, Low Temperature Research Station, Cambridge (after one year's training at Torry Research Station, Aberdeen) for research in refrigeration, processing and handling of meat—The Ministry of Labour and National Service, Technical and Scientific Register (K), 26 King Street, London, S W 1, quoting C 43/5A (February 26)

Lecturer in Applied Mathematics—The Registrar, King's College, Newcastle-upon-Tyne (February 28)

Lecturer (with a university degree in physical chemistry or chemical engineering) in Chemical Engineering—The Registrar, King's College, Newcastle-upon-Tyne (February 28)

River Inspector (corporate member of the Royal Institute of Chemistry and of the Institute of Sewage Purification, or other appropriate qualifications)—The Clerk, Lothians River Purification Board, City Chambers, High Street, Edinburgh (February 28)

I C I Research Fellows in Physics, Chemistry, Engineering, Metallurgy and Pharmacology, or any related subject, and Leverhulme Postgraduate Fellows (2) in the Faculty of Science—The Registrar, The University, Liverpool (March 1)

Reader in Experimental Physics at Queen Mary College—The Academic Registrar, University of London, Senate House, London, W C 1 (March 3)

Senior Scientific Officer (with a degree in physics or engineering, and experience in the design and development of lenses, and the supervision of a small optical workshop) in the Department of Supply, Weapons Research Establishment, Salisbury, South Australia, to undertake the design and development of optical systems for special purpose cameras and optical instruments—The Senior Representative, (A P 27), Department of Supply, Australia House, Strand, London, W C 2 (March 3)

Lecturer in Anglo-Saxon Antiquities and Archæology—The Secretary, University of Durham, 38 North Bailey, Durham (March 5)

Chair of Applied Science, with special reference to engineering, tenable at the Imperial College of Science and Technology—The Academic Registrar, University of London, Senate House, London, W C 1 (March 7)

Ciba Fellow in Clinical Pharmacology, to develop techniques for the clinical evaluation of drugs where suitable techniques are not already available—The Secretary of University Court, The University, Glasgow (March 12)

Lecturer in Chemistry (Organic Chemistry)—The Secretary of University Court, The University, Glasgow (March 12)

Lecturer in Engineering—The Secretary, The University, Aberdeen (March 12)

Cereal Technician (with intermediate B Sc or equivalent qualification, and preferably with a science background) **at the Agricultural Research Institute**, Wagga, Australia, to be responsible for the technical work involved in the assessment of wheat quality including laboratory milling, tests on dough quality and experimental bread making—The Agent-General for New South Wales, 56 Strand, London, W C 2 (March 14)

Assistant Lecturer in Physics—The Secretary and Registrar, University College of North Wales, Bangor, North Wales (March 15)

Assistant Lecturer in Theoretical Physics—The Registrar, The University, Manchester (March 16)

University Lecturer in Agricultural Zoology and Physiology of Farm Animals, and a **University Demonstrator in Agricultural Entomology**—The Secretary, School of Agriculture, Downing Street, Cambridge (March 16)

Research Officer (with a university honours degree in science, with chemistry, botany or biochemistry as major subjects, and preferably some research experience in mycology) **in the Biochemistry Unit**, Wool Textile Research Laboratories, Melbourne, Australia, to take part in a programme of research on cellulose-destroying fungi with special reference to the nutritional requirements of particular moulds, the nature of the enzymes produced and their mode of action on cellulose—Chief Scientific Liaison Officer, Australian Scientific Liaison Office, Africa House, Kingsway, London, W C 2, quoting 462/69 (March 19)

Head of the Department of Entomology—The Secretary, Rothamsted Experimental Station, Harpenden, Herts (March 31)

Lecturer in Applied Mathematics—The Secretary and Registrar, The University, Southampton (March 31)

Technical Assistant (graduate, whose degree course included mathematics and/or physics, and a knowledge of a modern continental language) **in the School of Theoretical Physics**—The Senior Clerk, Dublin Institute for Advanced Studies, 64 Merrion Square, Dublin (March 31)

Scientific Officer (with a first- or second-class honours degree in an approved scientific subject or other approved qualifications, and preferably with industrial experience) **in the Department of Industrial and Forensic Science** of the Ministry of Commerce—The Secretary, Civil Service Commission, Stormont, Belfast, N Ireland (April 1)

Director (with high attainments in one of the basic sciences relevant to the work of the Institute, and preferably with experience of horticultural crops) **of the Glasshouse Crops Research Institute**—The Secretary, Glasshouse Crops Research Institute, Worthing Road, Rustington, Sussex (April 15)

Lecturer in Applied Mathematics, and a **Lecturer in the Department of Civil Engineering** at the University of Cape Town, South Africa—The Secretary, Association of Universities of the British Commonwealth, 5 Gordon Square, London, W C 1 (Cape Town, April 15)

Senior Lecturer (with a higher degree, for example Ph D or equivalent qualifications, and preferably with lecturing experience) **in Physics** at the University of Queensland, Australia—The Secretary, Association of Universities of the British Commonwealth, 5 Gordon Square, London, W C 1 (June 15)

Biologist (preferably with an honours degree in zoology or one of the natural sciences) **in the Department of Game and Tsetse Control** Northern Nigeria, for duties which include the administration of game conservation and control, with study of animal ecology generally, the habits of individual wild animals, significance of wild animals to tsetse and diseases of stock—The Director of Recruitment, Colonial Office, Sanctuary Buildings, Great Smith Street, London, S W 1, quoting BCD 152/3/01

Chemical Technician (preferably with experience in a biological laboratory) **in the Radioisotope Laboratory** at the Pollards Wood Research Station, Chalfont St Giles, Bucks—The Institute of Cancer Research, Royal Cancer Hospital, Fulham Road, London, S W 3, quoting "Chemical Technician"

Experimental Officers (preferably with a pass degree in chemistry and experience in microchemical analytical techniques) to assist in basic research in inorganic chemistry and metallurgy—Senior Recruitment Officer, Atomic Weapons Research Establishment, Aldermaston, Berks, quoting 512/WGE/34

Lecturer (preferably with an honours degree in agriculture, horticulture or engineering, and experience in teaching and research) **in Farm Mechanization and Agricultural Engineering**—The Registrar, Wye College, near Ashford, Kent

Lecturer (with industrial engineering experience and also experience in research) **in Mechanical Engineering**—The Registrar, Queen Mary College (University of London), Mile End Road, London, E 1

Master to teach **Botany** and **Zoology** in the Sixth Forms—The Headmaster, St Dunstan's College, London, S E 6

Mathematicians (with a first- or second-class honours degree in mathematics, and preferably some research experience in an applied field) at various Ministry of Supply Research and Development Establishments in Southern England—The Ministry of Labour and National Service, Technical and Scientific Register (K), 26 King Street, London, S W 1, quoting A 28/5A

Scientific Officers (with a first- or second-class honours degree or equivalent in mathematics or mathematical physics), at the Royal Aircraft Establishment, Farnborough, Hants, for research and development on targets for guided weapons—The Ministry of Labour and National Service, Technical and Scientific Register (K), 26 King Street, London, S W 1, quoting A 36/5A

Scientific Officers (with at least a first- or second-class honours degree in chemistry, and preferably with research experience in physical chemistry), for basic research in inorganic and metallurgical chemistry—The Senior Recruitment Officer, Atomic Weapons Research Establishment, Aldermaston, Berks, quoting 511/WGE/34

Senior Experimental Officer or **Experimental Officer** (with at least H S C in physics or equivalent qualification in electrical engineering, and preferably with experience of metal vacuum systems and/or high voltage equipment), to take charge of the running, maintenance and improvement of a high voltage ion accelerator used for nuclear physics research—The Establishments Officer, United Kingdom Atomic Energy Authority, Atomic Energy Research Establishment, Harwell, Didcot, Berks, quoting 2/103/233

Senior Experimental Officer (with at least H S C (science) or equivalent, and several years appropriate experience in an industrial laboratory), at Sellafield, Cumberland, to undertake experimental work in metallurgy and physics—United Kingdom Atomic Energy Authority, Industrial Group Headquarters, P O Box 19, Risley, Warrington, quoting 797

LECTURES AND COURSES

CHELSEA POLYTECHNIC

MANRESA ROAD, S W 3
(Telephone FLAxman 5747)

Full-time courses and part-time day and evening courses are arranged in biology, botany, chemistry, geology, mathematics, physics, physiology, zoology, in preparation for the preliminary (intermediate) science examination and the B Sc general degree of the University of London for internal and external students, and for professional examinations Full-time or part-time courses are also held for the B Sc internal special or honours degrees in botany, chemistry (full-time only) geology, mathematics, pharmacy, physics, physiology (evening only) and zoology Facilities are provided for research and postgraduate study and short courses of lectures are held on special topics Full-time courses are arranged for professional qualifications in pharmacy and chiropody There are special evening courses in food and drugs, gemmology, industrial microbiology, and surgical technicians work

Applications for enrolment for the Session 1955-6 may now be made on forms to be obtained from the Principal

---

GRESHAM COLLEGE

BASINGHALL STREET, LONDON, E C 2

Four lectures by Professor H Hartridge, M A, M D, Sc D, M R C P, F R S (Gresham Professor in Physic), on "Some Mechanisms of the Body," Monday to Thursday February 21 to 24 The lectures are free and begin at 5 30 p m

STATISTICAL METHODS IN INDUSTRY

A short, residential course in PRACTICAL STATISTICAL CALCULATIONS suitable for scientists and technologists engaged in research and development, process and quality control, operational research and all kinds of investigational work will be held in Cambridge June 28 to July 7—Details from the Organizer, 18 Nightingale Road, Hampton, Middlesex

OFFICIAL APPOINTMENTS

The engagement of persons answering these advertisements must be made through a Local Office of the Ministry of Labour or a Scheduled Employment Agency if the applicant is a man aged 18 *to* 64 *inclusive, or a woman aged* 18 *to* 59 *inclusive unless he or she, or the employment, is excepted from the provisions of the Notification of Vacancies Order,* 1952

COMMONWEALTH AGRICULTURAL BUREAUX

COMMONWEALTH INSTITUTE OF ENTOMOLOGY

Applications are invited for an appointment as Acarologist, whose principal duty will be the determination of phytophagous and predatory mites of economic importance, but who would also enjoy excellent opportunities for general systematic work in the Acarina Candidates are sought who show evidence of special interest or achievement in this field The successful candidate would work in the British Museum (Natural History), London The salary will be in a scale that rises from £530 by annual increments to £1,540 per annum, with efficiency bars at £855 and £1 150 There is also a pay supplement that runs from £25 at £530 to £35 at £900 to £1,500 The starting salary will be determined by age, qualifications and experience Superannuation will be provided for under the F S S U

The closing date for applications is April 30 1955, and full details of the appointment and methods of application can be obtained from the Director, Commonwealth Institute of Entomology, 41 Queen's Gate, London, S W 7

EMPIRE COTTON GROWING CORPORATION

Entomologist required in August, 1955, to work on cotton and other crops in the Research Section of the Agricultural Department, Aden Postgraduate experience an advantage, but not essential Salary according to qualifications and experience but not less than £1,100, including local allowance Free quarters, leave passages and admittance, after probationary period to the Staff Assurance Scheme to which the Corporation contribute 21 per cent of basic salary

Applications, with names and addresses of two referees, to the Secretary, Empire Cotton Growing Corporation, 12 Chantrey House, Eccleston Street, London, S W 1

SHORT SERVICE COMMISSIONS IN THE INSTRUCTOR BRANCH OF THE ROYAL NAVY

Applications are invited from university graduates and qualified teachers under 36 years of age for Short Service Commissions of 3, 4, or 5 years in the Instructor Branch, Royal Navy Applications will also be accepted from final year undergraduates, and these will be considered in anticipation of their degree results Requirements are mainly for officers with qualifications in mathematics, science (physics, chemistry, metallurgy), or engineering, but a few vacancies exist for officers with qualifications in history or English with a sound mathematics or science background After two years' service, officers will be eligible for selection for permanent commissions A Short Service engagement in the Instructor Branch will discharge any candidate's obligation under the National Service Acts Entry will be in two grades Selected candidates with first- or second-class honours degrees receive approximately £410 in their first year's service, £429 in second year, £548 in third and fourth years, £584 in fifth year Other candidates receive £319 in first, £392 in second and third years, £429 in fourth and fifth years Previous officer service will be recognized for adjustment of seniority and rate of pay on entry Accommodation and rations are provided or allowances in lieu Married officers if aged 25 or over receive marriage allowance of £338 per annum if not accommodated in official married quarters, £283 per annum if they are so accommodated Married officers under the age of 25 receive marriage allowance of £146 per annum, but are not entitled to be accommodated in official married quarters An initial outfit allowance of £115 is paid, together with a free issue of certain articles of clothing A reduced allowance is payable to candidates with previous Naval Service as officers Tax free gratuities of £300, £400 or £500 are payable at the end of 3, 4 or 5 years respectively Instructor Officers serve both ashore and afloat and their duties include both technical instruction and general education Officers with suitable qualifications may also be trained and appointed for full- or part-time meteorological and weather forecasting duties Service in the Instructor Branch will, in the case of officers who enter from contributory service under the Teachers (Superannuation) Acts, be treated as contributory service, contributions being deducted from the above gratuities Other officers may have their service in the Instructor Branch similarly treated if they so desire

Fuller details and application forms may be obtained from Director (P) Naval Education Service, Admiralty, London, S W 1 Completed application forms should be returned, if possible, before May 31, 1955

McMASTER UNIVERSITY

DEPARTMENT OF PHYSICS
GRADUATE ASSISTANTSHIPS

Applications are invited for part-time teaching and research assistantships in the Department of Physics, McMaster University, from persons qualified to register in courses leading to the M Sc and Ph D degrees Assistantships normally carry a yearly stipend of $1,450 to $1,850 Assistants are required to devote 10 to 12 hours per week to duties during the academic session (October to April inclusive) and are able to devote full-time to their research during the summer Research is in progress in the following fields Theory of Molecular Spectra, F R Britton, Atomic Mass Determinations, H E Duckworth, Cosmic Rays, F Gulbis, Beta and Gamma Spectroscopy, M W Johns, Microwave Diffraction, A B McLay, Solid State, H E Petch, Theoretical Nuclear Physics, M A Preston, Fission Yields and Isotopic Abundances, H G Thode

Interested persons should write to Dr H E Duckworth, Department of Physics, Hamilton College, McMaster University, Hamilton, Ontario, Canada

---

UNIVERSITY OF BRISTOL

DEPARTMENT OF AGRICULTURE AND HORTICULTURE
RESEARCH STATION LONG ASHTON, BRISTOL

Applications are invited for the post of Scientific Assistant for Greenhouse Experiments to take charge of the experimental work with sand and water cultures in connection with investigations on the mineral nutrition of fruit crops The appointment will be in the Assistant Experimental Officer grade under the scheme of the Agricultural Research Council for Research Institutes

Further particulars may be obtained from the undersigned

A L LEGGETT,
Secretary

UNIVERSITY OF CAPE TOWN

PROVINCIAL ADMINISTRATION OF T
CAPE OF GOOD HOPE JOINT MEDICA STAFF

Applications are invited for the Chair Surgery in the University of Cape Town appointment will be made under the terms the Joint Staff Agreement between the Unive of Cape Town and the Provincial Administra of the Cape of Good Hope It is a full- appointment, and the occupant of the Chai not permitted to undertake remunerative pri work The salary is £2,500 per annum, plu temporary cost-of-living allowance (at pre £320 per annum for a married man and per annum for others) The professor is Hea the Division of Surgery He will be in charg surgical beds in Groote Schuur Hospital

Applications (with copies of testimonials) sh state age, experience, qualifications and rese work, completed or in progress, and give names of two referees whom the University consult Two copies of the application testimonials should reach the Secretary, Ass tion of Universities of the British Commonwe 5 Gordon Square, London, W C 1 (from w a memorandum giving the general condition appointment should be obtained), not later April 30, 1955 An additional copy shoul sent direct by air mail to the Registrar, versity of Cape Town, Private Bag, Rondebo Cape Town, South Africa, by the same date University reserves the right to recommend appointment of a person other than one of applicants, or to recommend no appointment

---

UNIVERSITY OF CAPE TOWI

SOUTH AFRICA

Applications are invited for a Senior Lec ship in Land Surveying The substantive s scale is £1,200 by £50 to £1,450 per an There is also a temporary cost-of-living allow for a married man (at present £234 per ann The salary scale recognized for the Provi Fund is £1,050 by £50 to £1,400 per annum

Applications (with copies of testimonials) sh state age, experience, qualifications and rese work, completed or in progress, and give names of two referees whom the University consult Two copies of the application testimonials should reach the Secretary, Ass tion of Universities of the British Commonwe 5 Gordon Square, London, W C 1 (from whc memorandum giving the general conditions o pointment should be obtained), not later April 15, 1955 An additional copy shoul sent direct by air mail to the Registrar, versity of Cape Town, Private Bag, Rondeb Cape Town South Africa, by the same date University reserves the right to appoint a pe other than one of the applicants, or to r no appointment

---

NOTTINGHAM NO 1 HOSPITA MANAGEMENT COMMITTEE

Applications are invited for the full-time pointment of Non-medical Biochemist (S grade) at the General Hospital, Nottingham beds) Whitley Council conditions of se apply

Applicants should send details of qualifica and experience, together with names and addr of two referees, to reach the Secretary Ge Hospital Nottingham, by March 5 1955

UNIVERSITY OF CAMBRIDG

SCHOOL OF AGRICULTURE

Applications are invited for three post Assistant in Research from October 1, 195 the following subjects agricultural enginee animal physiology, soil science Qualifica should include an honours degree in appro subjects The stipends of Assistants in Res are under review The present stipend is rising by annual increments of £25 to £600 posts are pensionable under the F S S U non-pensionable allowance of £50 a year is in respect of each dependent child under th of sixteen or in receipt of full-time educati

Applications should be made in writin reach the Secretary, School of Agriculture, D ing Street, Cambridge, not later than Marc 1955

MID-ESSEX TECHNICAL COLLE

MARKET ROAD, CHELMSFORD

Two adult Laboratory Stewards required i diately for (a) chemistry (b) instrument ma Salary £350 by £15 by £20 to £460 Su candidates may be considered for post of S Laboratory Steward Salary £440 to £520 salary scales are under review)

Details and application forms from Cle the Governors

UNIVERSITY OF CAPE TOWN

SOUTH AFRICA

Applications are invited for a Lectureship in
pplied Mathematics in the Department of
athematics, and for a Lectureship in the Depart-
:nt of Civil Engineering For the Lectureship
Civil Engineering preference will be given to
ndidates who have either practical or research
perience in (a) structural engineering or (b) in
: practical applications of soil mechanics The
ary scale is £850 by £50 to £1,150 per annum
e scale recognized for the Provident Fund is
)0 to £1,050 per annum) There is also a
nporary cost-of-living allowance for a married
in (at present £234 per annum)

Applications (with copies of testimonials)
ould state age experience, qualifications and
earch work, completed or in progress, and give
names of two referees whom the University
y consult Two copies of the application and
timonials should reach the Secretary, Association
Universities of the British Commonwealth, 5
rdon Square, London, W C 1 (from whom a
morandum giving the general conditions of ap-
ntment should be obtained), not later than
ril 15, 1955 An additional copy should be sent
ect by air mail to the Registrar, University of
pe Town, Private Bag Rondebosch, Cape
wn, South Africa by the same date The
iversity reserves the right to appoint a person
er than one of the applicants, or to make
appointment

SHEFFIELD EDUCATION COMMITTEE

KING EDWARD VII SCHOOL

Required for the Summer Term, 1955 an Assis-
t Master to teach physics to "A" level and
ne general science A special responsibility
owance of £90 will be available to a candidate
h suitable qualifications

Application forms obtainable from the Director
Education, Education Office, P O Box 67,
effield, 1 (stamped, addressed envelope) to
om they should be returned not later than
oruary 25, 1955

HILL END HOSPITAL

ST ALBANS, HERTS

Apply, giving brief particulars to the Director of Recruitment Colonial Office, Sanctuary Buildings, Great Smith Street, London, S W 1, quoting reference BCD 197/194/02

H M OVERSEA CIVIL SERVICE

Applications are invited for the following post Lecturer in Agriculture Tanganyika A Lecturer in Agriculture is needed in the Agricultural Department of the Government of Tanganyika, to teach at the Natural Resources School, Tengeru Candidates must be male between 25 and 45 years of age and possess a degree or diploma in agriculture and experience of teaching or lecturing in the subject Appointment on probation to the permanent and pensionable establishment if the officer is under 40 years of age (otherwise on contract terms), with salary in the scale £852 to £1,620 a year, plus a non-pensionable cost-of-living allowance of 10 per cent of salary Outfit allowance of £45 if initial salary is £1 206 a year or less Free passages on appointment and leave Government quarters, when available, at a rental of 10 per cent of salary Income tax at local rates

Apply, with brief particulars, to the Director of Recruitment, Colonial Office, Sanctuary Buildings Great Smith Street London, S W 1, quoting reference BCD 63/8/06

TECHNICIAN OR JUNIOR OR STUDENT Technician required for histological and microphotographic work, mainly in connection with research Salary scale, Technician, within range £470 to £545 Junior or Student Technician within range £150 to £393, according to age and experience —Apply in writing as soon as possible to Secretary, St Mary's Hospital Medical School, Paddington, W 2

BIOCHEMISTRY GRADUATE, PREFERABLY with some research experience, required for investigations on red-cell enzymes Salary up to £700 per annum, according to qualifications —Applications by April 15 1955 Further details from the Regional Director, Blood Transfusion Service, Royal Infirmary Edinburgh, 3

TECHNICIAN (MALE) REQUIRED IN THE Department of Chemical Pathology Salary on scale £450 to £515 per annum, with London weighting and superannuation Applicants should hold the A I M L T or an equivalent qualification —Apply in writing, giving details of experience to the Secretary Guy's Hospital Medical School, London Bridge, S E 1

VACANCIES IN THE METEOROLOGY Department, Imperial College London S W 7 (a) Experienced Physicist or Electrical Engineer with knowledge of electronics (salary £600 to £700), for work on clouds and rain (b) Physics Graduate, for research on thunderstorms (bursary £350) (c) Woman Mathematics Graduate for computational work (salary £400 to £450), ability to type an advantage Appointments for one year in first instance, starting as soon as possible, in any case before September 1 —Applications to the Registrar by March 15

MATHEMATICIAN AND PHYSICIST REQUIRED by Ministry of Supply Experimental Establishment, Porton, near Salisbury, Wilts, for operational research Qualifications First- or second-class honours degree in mathematics or physics Appropriate experience desirable Salary within Scientific Officer range £467 10s to £845 Women somewhat less F S S U benefits may be available —Application forms from Ministry of Labour and National Service Technical and Scientific Register (K), 26 King Street, London, S W 1, quoting A 33/5A

NORTHAMPTON POLYTECHNIC

LONDON, E C 1

Chief Laboratory Technician for applied phys required Knowledge of physics and laborat and workshop experience necessary Post invol assisting in development of laboratories and a some responsibility for junior staff Prefere given to man keen on continuing his stud Five weeks paid holiday annually Superann tion scheme -Scale £503 by £25 10s to £ per annum

Apply by letter to the Secretary

BRADFORD EDUCATION COMMITTEE

TECHNICAL COLLEGE, BRADFORD

Applications are invited for appointment Lecturer in Chemistry in the College Candid should possess experience in inorganic chemi and preferably in semi-micro analytical meth The salary scale for men (according to Burnham Technical Award) will be from £965 £1,065 per annum

Conditions of the appointment and forms application may be obtained from the Director Education, Town Hall, Bradford, 1, and c pleted forms should be returned to the Princ of the College as soon as possible

A SPALDING
Director of Educat

PHYSICIST REQUIRED BY NEWCAST Regional Hospital Board on basic grade Sal scale £460 by £25 to £510 Candidates must h a good honours degree in physics, but prev hospital experience not essential Appointee quired to assist in radium and x-ray proble including rotational therapy, as well as radiotope work —Applications, with names addresses of three referees, to be sent to Director, Cancer Organization, 3 Windsor C cent, Newcastle upon Tyne, 2, as soon as sible

---

READER AND SENIOR LECTURERS Lecturers in Physics —The Dean College of and Science, Baghdad, Iraq

APPOINTMENTS VACAN

RESEARCH PHYSICIST

The British Jute Trade Research Associa has a vacancy for a Physicist to assist in rese into the fundamental principles underlying processing of textile fibres into yarns the w primarily involves classical physics, and a cants should possess a good honours degree commencing salary will be fixed in accorda with the qualifications and experience of person selected and F S S U provision will available

Write, giving full details to the Secretary, British Jute Trade Research Association, noull Road, Kingsway West Dundee

---

PHYSICAL METALLURGIST REQUI for programme of laboratory investigational on alloys in the Research Laboratory of Imp Smelting Corporation Ltd A degree or equiv qualification in metallurgy is required, together at least one year's experience of the practical plication of physical metallurgy work, preferab a research department This is a senior staff pointment, superannuated, and commencing s will be entirely dependent upon individual q fications and experience —Applications to Pe nel Manager, Imperial Smelting Corporation Avonmouth, quoting reference LRM/N

IMPERIAL SMELTING CORPORAT has a vacancy for a Group Leader in Su Chemistry Section of Research Laborator supervise a small group carrying out researc vestigations on the surface chemistry of pigm Applicants should possess an honours degre chemistry and knowledge or experience in su chemistry, colloid chemistry or related fiel Applications, quoting reference GLS/N to sonnel Manager, Imperial Smelting Corpor Ltd , St Andrew's Road Avonmouth Bristo

---

JOHNSON MATTHEY AND CO, require two Graduate Chemists, age 25 to 3 the research laboratories of the Ceramic Div One man is required for investigation into ments, and experience of the paints or p industries would be considered an advantage second man is required for research in the of ceramic colours for the glass and po industries The appointments will be ma the permanent staff and carry full supera tion Salary according to qualifications an perience —Write, giving full particulars of education and experience, to the Res Manager, Johnson Matthey and Co Ltd liam Clowes Street, Burslem Stoke on Tr

MULLARD RESEARCH LABORATORIES invite applications from honours graduates to carry out research and development on the application of new magnetic materials to computors Initially, the work will be concerned with digital storage and information-handling devices incorporating ferrite cores

Postgraduate experience in either computor techniques, transistors or magnetic devices would be an advantage The work calls for a high degree of individual responsibility and there is great scope for initiative and inventiveness Publication of results will be encouraged

Salaries based on qualifications, experience and age, and are in keeping with present-day levels General prospects within the organization are excellent

Applications to

Mr G A Taylor,
Personnel Manager,
Mullard Research Laboratories,
Cross Oak Lane, Salfords,
near Redhill, Surrey,
quoting reference, E R L

A SCIENCE GRADUATE WHO IS IN-
ested in a progressive career in modern manu-
turing is required by a large and growing
mpany with chemical interests During the last
years the company has met its expansion needs
the introduction of graduates of progressive
tlook who wished to make a career in modern
lustry, and who wished to develop in the
nagerial and executive field without losing
ıch with technical matters Most of these
n have read chemistry, but it has appealed also
the engineer or physicist who wished to veer
ay from the purely technical field The initial
sition, after training will be the management
a small process or production department
e position will be clearly defined in both re-
onsibility and authority, and will be preceded
careful training under senior graduate mem-
rs This training will be continued long enough
ensure the position is taken over with confi-
nce Two other positions of a similar nature
ll be available later in the year, and applica-
ns from interested graduates taking finals this
mmer or from men in the Services, will be
nsidered now Upper age limit 27 years Com-
ncing salary £650 to £850, depending upon the
ndidate's background, and this will be paid
ring the training period At the end of train-
full scope will be given for the use of
lity and initiative and progress will be related
ely to merit All senior positions are, without
eption, filled from within the company Strict
nfidence will be observed —Please forward a
ef outline of background, etc, to Box 648,
G Scott and Son, Ltd, 143-147 Regent Street
ndon, W 1

OSEPH LUCAS, LIMITED, HAVE AN IN-
sting vacancy in their research and develop-
nt laboratories which would be suitable for a
ng graduate with honours degree in mathe-
tics or physics The work is largely of a
damental nature, and is concerned with
ustics and mechanical vibrations Previous
ustrial experience is not necessary —Please
ly, giving qualifications age, and any other
vant details, to Personnel Manager, Joseph
as (Electrical), Ltd, Great King Street,
ningham, quoting reference PM/D/59

EQUIRED IMMEDIATELY FOR SERVICE
overseas territories, experienced men, aged 25
35, with good personalities and qualifications
agriculture or agricultural sciences, to act as
hnical Representatives Excellent prospects
good salary according to qualifications, ex-
ience and territory Initial technical and com-
cial training before proceeding overseas —
te (quoting No 1011), stating age, fullest
iculars of qualifications and experience and
ry required, to Personnel Manager, Fisons
Control, Ltd, Bourn, Cambs

UBE INVESTMENTS RESEARCH
oratories require a young scientist for work
olymer research and measurements of proper-
of plastics Excellent prospects for advance-
t as a member of a team engaged on funda-
tal research in a vital new field —Apply,
ng qualifications and experience, to the Secre-
Tube Investments Research Laboratories,
ton Hall, Saffron Walden

RESEARCH AND DEVELOPMENT

Courtaulds, Ltd, invite applications for the following vacancies in their Research and Development Laboratories Bocking Braintree, Essex Graduate Textile Technologist, age 27-32, with industrial experience to work on textile dyeing and finishing Ref No D 61 Graduate Textile Technologist, to work on Research and Development in the field of textile manufacture Ref No D 62 Graduate Chemist, age 33 or less, for work on textile sizing Ref No D 63

Candidates should write for a detailed form of application to the Director of Personnel, Courtaulds, Limited, 16 St Martin's-le-Grand, London, E C 1, quoting the appropriate reference number

CHEMIST

HONOURS GRADUATE

Courtaulds Ltd, has a vacancy in its Textile Research Laboratory at Bocking, Essex, for a Graduate Physical Chemist who is interested in the basic physical problems of textile chemistry and is prepared to contribute original ideas in a developing situation Applicants should possess an honours degree and have had practical experience of research methods Age 25 to 33

Candidates should write for a detailed form of application to the Director of Personnel Courtaulds, Ltd, 16 St Martin's-le-Grand London, E C 1, quoting the reference number D 64

DISTILLERS COMPANY LIMITED

A vacancy has arisen in the Industrial Group Secretariat of the Company for an Assistant (male or female) to take charge of the recording and distribution of technical information Duties will include reading abstracting and circulating technical journals, and devising suitable filing systems for technico/chemical information Applicants should be between 30-50 years of age, and should possess a degree in chemistry or economics A knowledge of French and German, together with experience of abstracting from technical literature would be an advantage

Apply Staff Manager, The Distillers Co, Ltd, 21 St James's Square London, S W 1 Ref 4/55

A SPONSORED RESEARCH ORGANIZATion requires young Organic Chemists, male or female with honours degree or equivalent, for research and development work Recently graduated applicants would find this an interesting opening to industrial research Applications are also invited from organic chemists for a more senior position —Full particulars, in confidence to J A Radley, Industrial Research and Development Laboratories Elgar Road, Reading

RESEARCH CHEMIST THE BRITISH Drug Houses, Ltd, have a vacancy in their Chemical Research Laboratories for a young woman graduate interested in steroid chemistry Previous experience desirable, but not essential —Write, giving details of studies, experience, if any, and age, to Staff Manager, Graham Street, City Road, N 1

A GRADUATE IS REQUIRED FOR BASIC and applied research on the machining and cold forming of metals A good degree (or equivalent qualification) in engineering science or metallurgy is required There are good prospects for advancement Commencing salary commensurate with qualifications and experience Pension scheme —Send full details, including age, experience, qualifications and present salary in confidence to Box 649 T G Scott and Son Ltd 143-147 Regent Street, London, W 1

APPLICATIONS ARE INVITED FROM recently qualified chemists for an interesting and progressive post in a cereal laboratory The work will involve non-routine analysis and research Applicants should be in the 20-25 age group Five-day week, and pension scheme in operation —Write, giving full particulars of academic qualifications and experience to Personnel Manager (L), Quaker Oats Limited, Bridge Road, Southall Middlesex

PHILIPS BALHAM WORKS, LTD 45 Nightingale Lane, S W 12, requires Graduate in Electrical Engineering or Physics preferably with experience in electronics, for development of nucleonic instruments Permanent appointment with excellent prospects —Applications should be addressed to the Personnel Officer at the above address

THE EDISON SWAN ELECTRIC CO, Ltd, Cosmos Works, Brimsdown, Enfield, Middlesex, has vacancies in its Research and Development Departments for

1. Development Engineers for work on design and development of thermionic valves
2. Technical Assistants for work in connection with design and development of thermionic valves
3. Mechanical Engineers interested in the problems of mass production associated with thermionic valves

These vacancies are the result of a rapid expansion in the Company's activities The positions are progressive and carry the advantages of a pension scheme

Applicants for vacancies (1) should have an engineering or physics degree but applications from candidates with H N C or equivalent will be considered

Applicants for vacancies (2) and (3) should have ordinary N C or H N C or Inter B Sc or equivalent

The starting salary will be in accordance with the qualifications, experience and age of the applicants

Applications should be in writing and will be treated with the strictest confidence

Apply to the Personnel Superintendent

RESEARCH ENGINEERS HONOURS graduates preferably with some postgraduate or industrial research experience, capable of planning and controlling research work on a wide range of mechanical engineering problems including materials structures, mechanisms and heat transfer Wide scope and good prospects for men with initiative Age 25 to 30 approximately —Applicants should write to Manager, Research Department, Metropolitan-Vickers Electrical Co Ltd, Trafford Park, Manchester, 17, giving a statement of their age, qualifications and experience and suitable references

ARTHUR GUINNESS, SON & CO (DUBlin) Ltd have a vacancy for a Chemist in their Brewing Research Laboratory, Dublin, to work on general analytical and brewing research problems Candidates should possess a good honours degree in chemistry, and some postgraduate experience Salary according to qualifications and experience There is a non-contributory pension scheme, and other benefits — Applications, giving full details of qualifications and experience, should be addressed to the Chief Chemist, Arthur Guinness Son & Co (Dublin), Ltd, St James's Gate, Dublin

ARTHUR GUINNESS, SON & CO (DUBlin) Ltd require a Chemist or Biochemist for their Brewing Research Laboratory in Dublin The post will be a responsible one and will offer ample scope and prospects to one interested in biochemical research work Candidates should be under thirty years of age and possess a good honours degree in chemistry or biochemistry and postgraduate experience in research work Knowledge of enzymology would be an advantage A good salary will be offered and there is a non-contributory pension scheme, and other benefits —Applications, giving full details of qualifications and experience should be addressed to the Chief Chemist, Arthur Guinness Son & Co (Dublin) Ltd, St James's Gate Dublin

ENGLISH CLAYS LOVERING POCHIN & Co Ltd St Austell, Cornwall, have vacancies in the Research Department for (1) an Inorganic Chemist with postgraduate experience (2) a Graduate Physical Chemist —Application in confidence to the Research Manager

SENIOR AND JUNIOR RESEARCH PHYsicists, preferably with university or industrial research experience are required to undertake basic research work of thermionic emission and related aspects of surface physics Wide scope and good prospects for men with initiative — Applicants should write to the Manager, Research Department, Metropolitan-Vickers Electrical Co Ltd, Trafford Park Manchester, 17, giving particulars of their age, qualifications and experience and suitable references

LADY CHEMIST, GRADUATE OR H N C, required for analysis of electroplating and allied solutions —Apply, Electro-Chemical Engineering Co, Ltd, 161 Queens Road, Weybridge, Surrey

TECHNICAL LIBRARIAN

WOMAN

Courtaulds Limited require a technical librarian (woman) for a new research laboratory at Coventry Candidates should have a knowledge of chemistry to degree standard and previous experience in an industrial technical library

Candidates should write for a detailed form of application to the Director of Personnel Courtaulds Limited, 16 St Martin's-le-Grand, London, E C 1, quoting the reference number D 60

BAKELITE LIMITED HAVE VACANCIES at their Aycliffe (Co Durham) works for two young qualified chemists and a young chemical engineer Applicants should have a B Sc degree or equivalent and some industrial experience The work concerns chemical and chemical engineering investigation into problems arising in the manufacture of P V C resins and compounds, and the manufacture of products based upon P V C resins Salaries will be in the range of £650 to £850 per annum in accordance with age and experience —Applications should be addressed to The Personnel Manager, Bakelite Limited, 12 Hobart Place, London, S W 1

GLASS / CERAMIC / VITREOUS ENAMELling Technologists, preferably university graduates, required for research and development work on vitreous enamels at laboratories situated in Warrington Candidates should have had some industrial experience in one of the ceramic fields, and be less than 35 years of age —Replies should be addressed to Radiation Ceramics Research Department, Richmonds Gas Stove Company, Ltd Grappenhall Works Warrington

---

ROWNTREE & CO , LTD , INVITE APPLICATIONS for three senior appointments in the fields of biochemistry, physical chemistry and physics on the staff of a new Research Unit at York, the erection of which is now nearing completion The men appointed should have high professional attainments in their respective fields, and in particular should have initiative and the ability to handle their problems constructively They will be expected to work co-operatively on the various projects under investigation , the problems will be related to the Company's products and, while not academic in character, they will nevertheless, be of a fundamental nature It is hoped that ultimately one of these men will be appointed to head the Unit Men of exceptional calibre are being sought, and the salary will be commensurate with these qualifications Appointments will qualify for participation in the Company's Pension Scheme, under which pensions equivalent to two-thirds of salary are achievable —Letters of application should give, in confidence full details of the applicant's age, training and career, and should be addressed to the Staff Officer (Men A), Rowntree & Co , Ltd The Cocoa Works, York

---

THE BRITISH BOOT, SHOE AND ALLIED Trades Research Association requires two young physicists Post No 1 For work on physical properties of shoes and shoe materials (e g , moisture transmission and sorption , elasticity and plasticity) and applications to (a) foot comfort problems (in collaboration with a physiologist), and (b) basic processes of the industry (e g , lasting) Qualifications At least two years' research experience, with proved ability in experimental and theoretical work Post No 2 For practical research and development work on (a) footwear production and wear problems, and (b) shoe materials Recent graduates considered, but some laboratory experience (industrial or other) will justify higher starting salary Both posts offer good prospects in status and salary (no fixed ceiling) F S S U —Applications to H Bradley, C B E , Director of Research Satra House, Rockingham Road, Kettering, Northants

---

GRADUATE CHEMIST, METALLURGIST or Chemical Engineer required to deal with problems relating to the installation of electroplating plant and process control Applicants must have completed military service and be willing to travel —Apply, Electro-Chemical Engineering Co , Ltd , 161 Queens Road, Weybridge, Surrey

---

CHEMISTS OR PHYSICAL CHEMISTS, with honours degree or equivalent required for fundamental investigations on the combustion of fuels, with particular reference to corrosion problems Initial salary according to qualifications and experience in range £500 to £740, or £800 to £900 Pension scheme —Apply in writing to Assistant Secretary Ref B 10, B C U R A , Randalls Road Leatherhead

---

EDITORIAL ASSISTANT REQUIRED FOR metallurgical monthly in London Training in pure or applied science desirable —Full details to Box 647 T G Scott and Son, Ltd 143-147 Regent Street London W 1

THE EDISON SWAN ELECTRIC CO , Ltd , Cosmos Works, Brimsdown, Enfield, Middlesex, has vacancies in its Research and Development Laboratories for

1 Circuit Development and Application Engineers for colour television investigations

2 Circuit Development and Application Engineers for black and white television development work

3 Engineers for development work on television and F M amplifier problems Previous experience in V H F or F M required

4 Cathode Ray Tube Development Engineers for development work on colour and black and white tubes Previous experience on cathode ray tube development or design required

5 Application Engineers for work in connection with customer problems on television, radio and F M

6 Engineer for design of test equipment for colour black and white television and allied development work

7 Engineers for circuit development and application work on transistors

The above applicants should have a good engineering or physics degree or equivalent, but vacancies also exist for candidates with H N C or equivalent qualifications

The vacancies are a result of a large expansion in the Company's activities

Good salaries will be paid to suitable applicants, and the positions are progressive and carry the advantages of a pension scheme

The starting salary will depend on the qualifications, experience and age of the applicants

Applications in writing, which will be treated with the strictest confidence, should be sent to the Personnel Superintendent

---

MECHANICAL AND CHEMICAL ENGINEERS

Courtaulds, Limited Chemicals Division, requires two graduate Mechanical Engineers and one Chemical Engineer for investigational and development work near Manchester The work is of an original nature in connexion with the development of chemical plants and processes for which a real interest in, and potential talent for, engineering development work as applied to large-scale chemical plant is of paramount importance The Mechanical Engineers must have served an apprenticeship for at least two years and all candidates must have had practical works experience Honours degree men preferred Age 25 to 35

Candidates should write for a detailed form of application to the Director of Personnel Courtaulds, Limited, 16 St Martin's-le-Grand, London E C 1, quoting the reference number H8 for Mechanical Engineers and H 9 for the Chemical Engineer

---

ASSISTANT WITH TECHNICAL QUALIfications required by Metropolitan-Vickers Electrical Co Ltd , Trafford Park, Manchester, 17, to train as Industrial Information Officer Experience of this type of work is not essential Salary will depend on qualifications and experience and will be progressive —Write giving full particulars including age, sex nationality education and experience to Personnel Manager marking envelope " H 2 "

ABSTRACTOR REQUIRED FOR ENGINeering and physics subjects by Metropolitan-Vickers Electrical Co Ltd Trafford Park Manchester, 17 Progressive opportunities for one who has ability for concise expression, is interested in new developments and in writing up technical matter Engineering experience would be an advantage initially, but experience in abstracting not essential —Apply in writing to Personnel Manager, giving details of technical qualifications experience, if any, and present salary Mark envelope " F 1 "

MAY & BAKER LTD , DAGENHAM, Essex, have a vacancy for a young graduate in their Biological Control Department The post involves mainly biological standardization of chemotherapeutic substances —Apply initially in writing, stating age and qualifications, to the Personnel Officer, quoting reference No 69

UNICAM INSTRUMENTS, LTD.

Applications are invited from electron
engineers for positions in the develo
ment and inspection departments of Unicam I
struments of Cambridge This company is e
gaged in the manufacture of important instr
ments, combining original optical and electron
design, which are much in demand for academ
and industrial research and process control t
world over Good salaries according to quali
cations will be paid —Applicants should send f
details of age, education and experience to t
Personnel Manager, Unicam Instruments Lt
Arbury Works Cambridge

PHYSICIST / MATHEMATICIAN TAYLO
Taylor & Hobson, Ltd , require a man
specialize in the design and development
precision optical instruments He must be
skilled optical designer capable of tackling a w
range of problems, and will work in close c
operation with the Mechanical Design Depa
ment A starting salary of not less than £8
per annum will be paid to a suitable candida
—Apply to Development Director, Stought
Street Works Leicester

ECTRICAL INDUSTRIES, Ltd Aldermaston
urt ALDERMASTON, Berks

ANALYTICAL CHEMIST

ritish Insulated Callender's Cables Ltd re-
ire an Analytical Chemist with some experi-
e in the field of corrosion, for work in their
rosion Research Laboratory, Kirkby, near
erpool The minimum qualifications required
an honours B Sc degree in chemistry or the
sociateship of the Royal Institute of Chemis-

Salary will be in accordance with age quali-
itions and experience

Applications should be addressed to the under-
ned quoting reference number P/70/55

THE STAFF OFFICER, B I C C LTD ,
Prescot, Lancs

HEMISTS ARE REQUIRED FOR THE
stics Division of Thomas De La Rue and
mpany Limited The vacancies are caused by
continuous expansion of the Company's
ivities in the plastics field and offer a wide
erience in this industry Applicants should
ssess a university degree, high national certi-
ate, or A R I C in chemistry or technology
d must show evidence of a wide field of inter-
s The positions may involve liaison with
stomers and a pleasant personality will there-
e be considered important Successful appli-
nts will be given adequate training and will
n be responsible for process control of plastics
nufacture Promotion will be rapid for those
wing keenness and ability The starting
ary will depend upon qualifications and ex-
ience, but will in no case be less than £600
annum—Apply, giving brief details of
demic and industrial experience to Personnel
nager, Thomas De La Rue & Co , Ltd West
rton North Shields Northumberland

METALLURGIST OR CHEMIST WITH UNI-
sity degree or equivalent required in modern
tallurgical research laboratory for investigational
rk on problems associated with metal arc weld-
Some experience in research or industry
irable, a knowledge of arc welding an advan-
e but not essential Excellent salary and pros-
ts—Applications, giving full details to Re-
rch Manager, Ref M , Murex Welding Pro-
ses Ltd , Waltham Cross, Herts

RITISH INSULATED CALLENDER'S
bles Ltd , require Chemists at their Helsby
rks near Chester, preferably graduates with
ne industrial experience for development and
lytical work on Thermoplastic Cable Com-
unds—Applications should be submitted in
iting, quoting reference No H/73/55 to Staff
icer, B I C C Ltd , Prescot, Lancs

WELL QUALIFIED GRADUATE CHEMIST
Physicist, preferably with experience in the
stics industry, wanted for development work
the rapidly expanding field of fibreglass re-
orced plastics Salary according to age and
erience, with good conditions of employment
promotion prospects—Applications to the
chnical Director, Fibreglass, Limited, Raven-
d Works, St Helens Lancashire (a subsidiary
Pilkington Brothers, Limited)

Advertisers please note You must add "Apply Employment Exchange" unless the employment advertised or the workers required are excepted under the Notification of Vacancies Order

---

CHIEF CHEMIST REQUIRED BY FIRM specializing in the rare metals to supervise both routine and research laboratories Ph D or equivalent degree with some industrial experience Commencing salary £1,500 per annum. Contributory pension scheme—Box 636 T G Scott and Son, Ltd , 143-147 Regent Street, London W 1

IMPERIAL CHEMICAL INDUSTRIES, LTD Lime Division has vacancies for Research Chemists (age range 26-35) Candidates should have a Ph D , M Sc , or at least an honours degree in physical and inorganic chemistry—Apply, giving full particulars, to the Division Staff Officer, Royal Exchange, Buxton

---

BOOTS PURE DRUG CO LTD HAVE A vacancy in the Pharmacology Division of the Research Department for a young graduate, preferably with some research experience The successful applicant will be engaged in pharmacological and toxicological investigations Salary in accordance with qualifications and experience—Applications to Personnel Manager Station Street Nottingham

---

THE SHELL PETROLEUM COMPANY, Limited has following openings at their Research Centre, Thornton-le-Moors, Cheshire for (A) Organic Chemists, positions involving applicational work on the Company's products, and will concern studies in the fields of organic synthesis, hydrocarbon analysis or general oil chemistry Candidates should possess good honours degree or equivalent (B) Physical or Organic Chemists, preferably with postgraduate research experience and an interest in mass spectrometry The work is concerned with application of a mass spectrometer to research on gaseous, volatile and higher boiling hydrocarbons A working knowledge of electronics and mathematics, including the use of calculating machines, is essential, and general interest in the use of fuels and lubricants would be an additional advantage Starting salary according to qualifications and experience Attractive pension benefits—Apply in writing giving age, full details of experience and qualifications also whether applying for (A) or (B) to Staff Department R/2, Shell Petroleum Company, Limited, St Helen's Court, London E C 3

APPLICATIONS ARE INVITED FROM young Physicists possessing honours degree for work on the development of transistors Post-graduate work on semi-conductors and solid state physics would be an added qualification Laboratories in ideal country surroundings—Applications to Personnel Manager, Standard Telephones and Cables, Ltd , Ilminster

APPOINTMENTS WANTED

BACTERIOLOGIST, 11 YEARS' TECHNICAL and administrative experience, desires post in India preferably Bombay—Box 650 T G Scott and Son, Ltd 143-147 Regent St , London, W 1

ROYAL DUTCH SHELL STUDENTSHIP IN GEOPHYSICS

This studentship is open to honours graduates in physics or geology (with mathematics and physics at intermediate level) for a two-year course from October, 1955, in Geophysical Prospecting applied to the search for oil Value £430 per annum less fees £60 per annum

Applications must be received before June 1 1955 Further particulars from Registrar, Imperial College S W 7

UNIVERSITY OF CAMBRIDGE

ESSO STUDENTSHIP IN CHEMICAL ENGINEERING

The Managers of the Esso Fund invite applications for an Esso Studentship to be tenable in the Department of Chemical Engineering of the University of Cambridge Applicants should be persons domiciled in Great Britain or Northern Ireland who hold or expect to hold a university degree with high honours in chemical engineering or in some other branch of engineering or chemistry The Studentship will be tenable for two years from October 1, 1955, and it will be necessary for the student to become a member of the University of Cambridge before the end of the Michaelmas Term, 1955, and to remain a member of it during his tenure of the Studentship It will be the duty of the student to devote himself to full-time study and training for research in chemical engineering, under such conditions as the Managers may determine The value of the Studentship will be £350 a year plus approved fees

Forms of application may be obtained from the Secretary Department of Chemical Engineering, Tennis Court Road, Cambridge, and should be completed and returned so as to reach him not later than April 30, 1955

ROYAL HOLLOWAY COLLEGE

UNIVERSITY OF LONDON

Tutorial Research Studentships in English and Mathematics (pure or applied) are offered for the session 1955-6, renewable for a second year A Studentship is intended to enable the holder, while gaining some experience of university teaching, to work for a higher degree of the University of London or some other university Value £300 a year, or £150 with board and residence

Particulars may be obtained from the Principal, Royal Holloway College, Englefield Green, Surrey, to whom applications should be sent as soon as possible and not later than March 14, 1955

THE ROYAL SOCIETY

GOVERNMENT GRANT FOR SCIENTIFIC INVESTIGATIONS

Applications for grants from the first allotment of the Government Grant for Scientific Investigations for the year 1955 should be made as soon as possible on forms of application to be obtained from the Assistant Secretary of the Royal Society, Burlington House, London, W 1 No application can be considered which is received later than March 31, 1955

Applicants must be of British nationality resident in Great Britain or Northern Ireland Grants may be made for purposes in connection with the promotion and support of research in pure science other than for personal maintenance or payment of stipends , for the assistance of scientific expeditions and collections , but not in aid of scientific publications

FOR SALE AND WANTED

CORNEAL AND CONTACT LENSES EASY payments arranged if desired—For details and free booklet write David Blackstone, Ltd , Dept 235, Triumph House, 189 Regent Street, London, W 1 Tel Regent 3516-7 Consulting Rooms in Leeds, York, Leicester, Middlesbrough, Newcastle etc

"The Tiger that lurks in the skies"
. . . will FLUOROCARBONS be the answer?

"Fire", the tiger of the skyways has not yet been banished from aircraft — and scientists the world over are still seeking a complete solution to this menace Fluorocarbons may well provide the answer and would seem to offer the highest possibilities of evolving completely fire-proof aircraft Investigations have shown that Fluorocarbon liquids can replace the inflammable fluids at present used in hydraulic control systems and de-icing equipment Lubricants too can be made of Fluorocarbons — in addition, the application of Fluorocarbons to high speed bearings and inflammable paints is well within the bounds of possibility

ANHYDROUS HYDROFLUORIC ACID HYDROFLUORIC ACID
BORON TRIFLUORIDE · BENZOTRIFLUORIDE FLUOSULPHONIC ACID

The above compounds are of great value in the manufacture of fluorinated materials and are available in commercial quantities Industrial applications include catalysts, lubricants, plastics and specialised welding

Should you have any problems or theories on these or any other applications please consult us

Wherever you need distilled water — in laboratory, factory or shop — you can use 'Deminrolit Water' with equal results The Portable 'Deminrolit' plant operates by ion exchange and delivers water substantially free from dissolved solids. Running costs are measured in pence instead of in pounds, and you can thus use distilled quality water for many purposes where the cost of distillation would prove prohibitive

Please write for Technical Publication No 62 which gives full details.

HIRE SERVICE

Why not try demineralised water in your industry? You can do so easily and cheaply by hiring from us, at a nominal rental for a trial period, the latest Mark II Model Portable 'Deminrolit' Plant Details of this service will gladly be supplied on request.

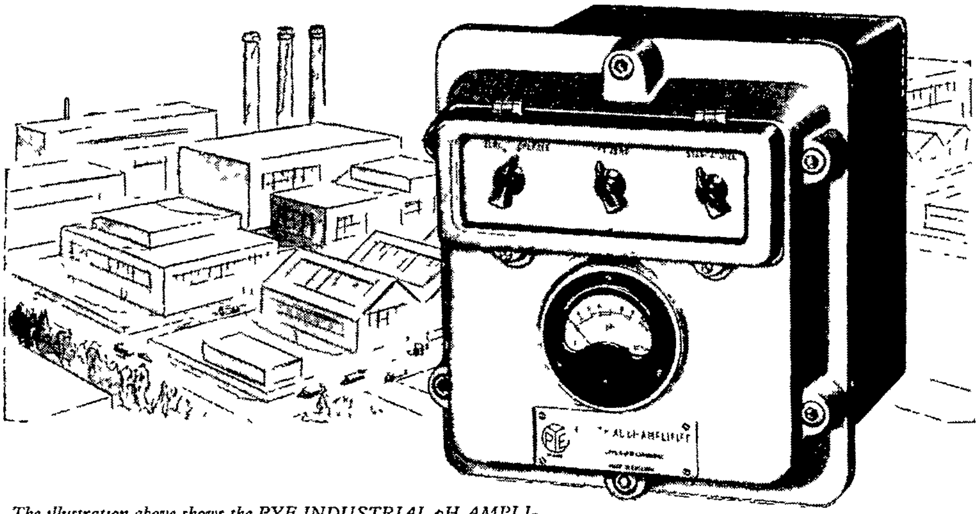
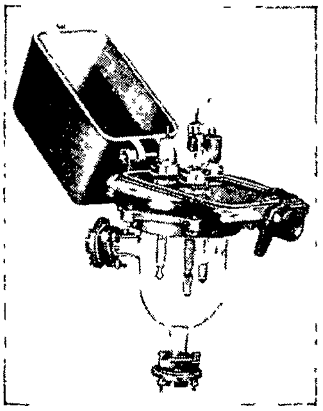
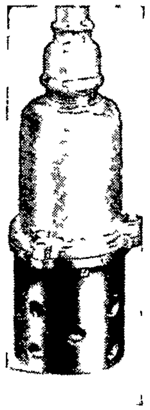
INDUSTRIAL pH AMPLIFIER



The illustration above shows the PYE INDUSTRIAL pH AMPLIFIER Cat No 11400, which is built into a flame-proof case, constructed for easy servicing and designed for the continuous measurement of pH values It will drive controllers, recorders, remote indicators and alarm-relays Below on the left is illustrated the Continuous Flow Electrode Assembly, Cat No 11420 and on the right the Immersion Type Electrode Assembly, Cat No 11405 May we send you details of these instruments ?





IN every industry where water or chemical solutions are used, money can be saved and efficiency can be increased through effective pH measurement and control The exact measurement of acidity and alkalinity will readily provide the key for methods of eliminating waste, reducing maintenance and corrosion, developing new products and improving product quality at the lowest possible cost

The glass electrode pH Amplifier operated from the mains, and presenting a direct indication, provides the simplest, quickest and most efficient method of measuring and controlling pH The use of this type of instrument is quickly becoming a major feature of the current trend towards instrumentation in industry

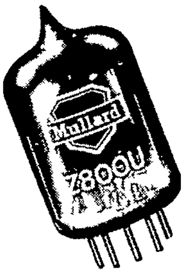
STABILISERS & REFERENCE TUBES

Characterized by close tolerance burning voltages, very small voltage fluctuations, freedom from sudden large jumps throughout working current range, and long-term stability.

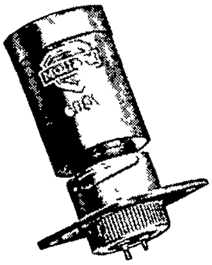


TRIGGER TUBES

Cold cathode tubes for particle counters and very low current stabilisers

ELECTROMETERS

Triode and pentode octal and subminiature types for use with radiation monitors, photocells and other devices where a high input impedance is essential

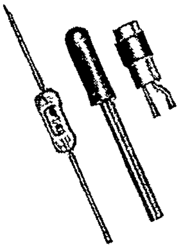


PHOTOCELLS

Vacuum and gas-filled photoelectric, and lead sulphide photoconductive types for light-activated relays and infra-red applications

SPECIAL QUALITY VALVES

Special counterparts of popular types, designed and manufactured to withstand shock and vibration and to provide extra all-round reliability



SEMI-CONDUCTOR DIODES & TRANSISTORS

A range of germanium diodes and transistors for scaling circuits, very low power H T generation and for trigger circuits

Valves and Tubes for Nuclear Physics

Among the valves and tubes in Mullard's comprehensive range are many that are suited for the most specialised and complex applications Whatever your interest in electronic valves and tubes, your enquiries will be welcomed at the address below where full technical details and characteristic curves are available

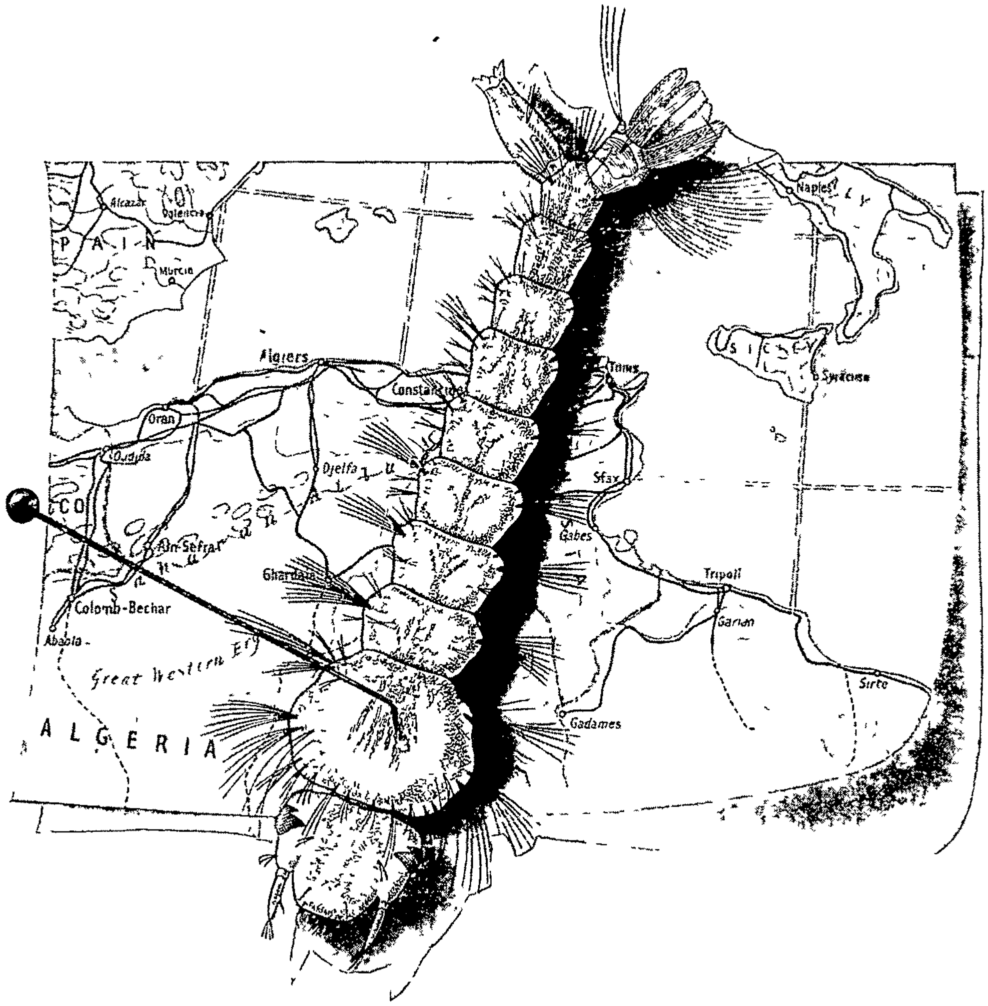
TAS/Sc 305



The case of the *Culicine larvae* . . .

In Algeria the still, shallow waters of the rice fields are perfect breeding grounds for mosquitoes, anophelene mosquitoes that transmit malaria and culicine mosquitoes that plague man and beast Control measures are now being intensified throughout the infested areas, aimed at controlling all mosquitoes in the larval stage The Shell insecticide dieldrin — in granule form — has been chosen for this important work

Dieldrin granules have been chosen with good reason Dieldrin is deadly to *all* species of mosquitoes, even the difficult-to-control culicines In the rice fields, conventional dusts and sprays are caught by vegetation above the surface and largely wasted, but the specially prepared dieldrin granules, applied from the air, penetrate the foliage and get right down to the larvae in the water

15 to 20 lbs of granules to the acre — only a few ounces of actual dieldrin — are bringing even the heaviest infestations under complete control

Dieldrin's range of control is unique all mosquitoes and all other major disease-carrying insects More powerful, exceptionally persistent, giving surer kill at lower dosages, dieldrin is the outstanding insecticide developed in recent years for the protection of health against insect attack

Another recent Shell development is aldrin, fast becoming recognised as the most widely effective and most economical of all insecticides for use in the soil

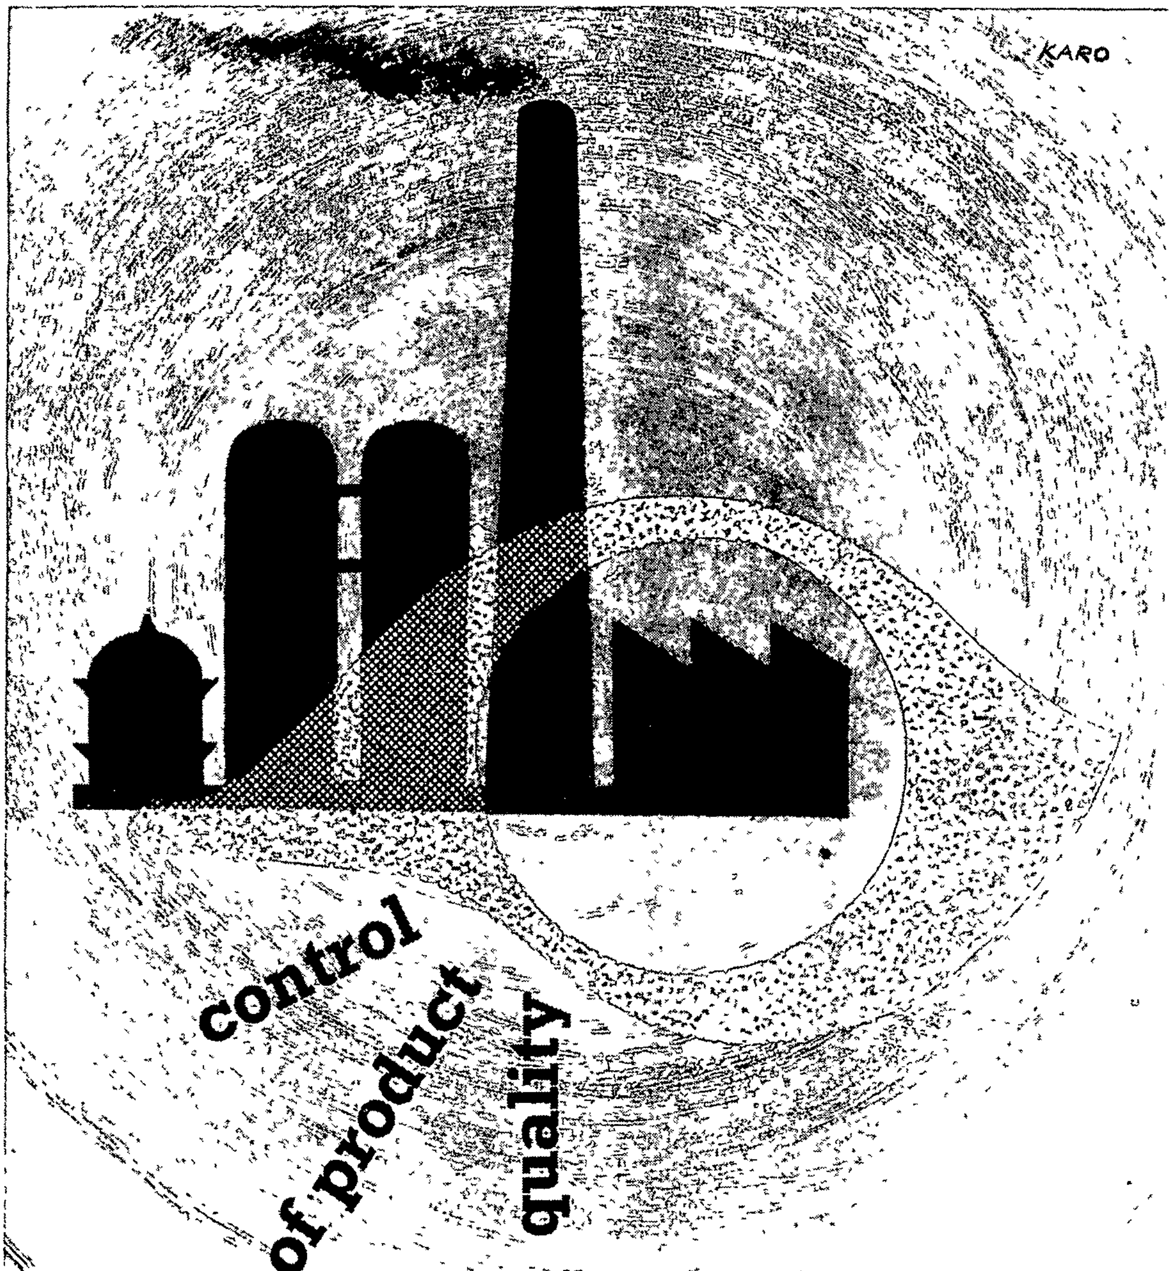
Have you an urgent pest problem in your area ?

dieldrin

dieldrin and aldrin are SHELL insecticides for world-wide use

For further information apply to your Shell Company

Issued by The Shell Petroleum Company Limited, London, E C 3, England



New products and new processes are the outcome of continuous research. It follows that the tools of research are applicable to process control. The Spectrophotometer, widely used in research laboratories for ultraviolet, visible and infrared investigations, is the ideal instrument for routine analysis and control of product quality

Chemists who need to keep an eye on things are invited to write for details to Unicam Instruments of Cambridge.

NATIONAL PARKS IN GREAT BRITAIN

THE fifth report of the National Parks Commission* appears at a moment when at least wo matters of current controversy give particular point to the retrospect and prospect with which the Commission concludes the normal review of a year's activities Taken by themselves, the year's activities of the Commission constitute a record of creditable achievement. No new 'parks' were designated in Great Britain during the year, though progress is apparent with the designation of the Yorkshire Dales National Park, and the negotiations for a Cheviot National Park are particularly encouraging, both because a proposal was put forward on the initiative of the Northumberland County Council for a Northumberland National Park embracing also the Kielder moors and part of the Roman Wall area, and or the evidence it affords of a clearer and wider understanding of the purpose of a 'national park' Preliminary discussions have also been held regarding he Brecon Beacons and the Black Mountains area, on the other hand, except in the Peak District National Park, the administrative arrangements still eave much to be desired and there is little evidence here of progress towards fulfilling the purpose of the Act. The Pembrokeshire Coast National Park Committee has taken the welcome step of setting up an architectural panel to advise on certain planning applications before submission to the Committee, and he Commission professes satisfaction with the work carried out by the Peak District and Lake District National Park Planning Boards. For example, the ormer Board has completed its survey of 'open country' and has made substantial progress in negotiations with landowners for the conclusion of public access agreements in the Kinder Scout area The Lake District Board has organized the permanent camping site at Silecroft and made substantial progress with the development of organized caravan ites by private enterprise.

Much of the work of whatever administrative authority is established for a national park will onsist of the quiet implementation of specific proposals and of educating public opinion—securing o-operation and higher standards of conduct in egard to litter and other forms of vandalism in the Park areas The form of administration is important, however, when a clash arises between some immediate interest of the local community or the specific requirements of a government department or national orporation and the national interest in the preservation of amenity which the National Parks Commission was established to safeguard Moreover, while the local authorities are even less able than the National Parks Commission to resist the pressure of the powerful nationalized corporations and government departments, the omission to provide the National Parks Commission with adequate financial resources and staff of its own increases the risk of conflict between the local authorities and the Commission.

The fact that such unsatisfactory systems as that adopted for the Snowdonian National Park have worked rather better than could have been expected does not affect the main point · apart from the absence of an adequate overall view, and greater danger from the operations of the Electricity Authority or Service Departments, for example, the local authorities are, at best, subjected to an unreasonable strain between local and national responsibilities, at worst, relations between them and the National Parks Commission can be exacerbated and deadlock ensue.

Ample evidence of this is provided by the present report There is no mention in it of the project for a Cornish National Park, negotiations for the boundaries of which began nearly three years ago. In its previous report the Commission referred to the recommendation of the Cornwall County Council that the project should be deferred *sine die*. The Commission then recorded its refusal to acquiesce in a proposal to suspend the intentions of Parliament in this way, but there is no hint in the present report as to when the Commission proposes to renew the discussions, and neither in its retrospect nor in its prospect does the Commission judge the flouting of Parliament by local authority important enough for comment.

Exmoor provides another example of failure to reconcile the divergent views of county councils and the Commission, but here the Commission has proved less acquiescent and proceeded with the designation The designation order, after a public inquiry in June 1954, was confirmed by the Minister without modification on October 15, 1954. It should be noted, moreover, that, while the designation order was opposed by the Devon and Somerset County Councils and the Williton and Dulverton Rural District Councils, it was supported by the Lynton and Minehead Urban District Councils Again, the Commission is disappointed at the slow progress in creating footpath agreements in regard to the long-distance routes, no fresh proposals have been submitted for such routes With regard to the path along the south coast of Cornwall, which, when complete, will give, with that already approved on the north coast, some 270 miles of continuous path around the whole coast-line of Cornwall, the Ministry has taken the initiative in approaching the local authorities concerned in giving assistance and urging them to complete the work as soon as practicable.

It is obvious that finance is a major factor, both in the slow progress with the long-distance routes and in the attitude of some local authorities to the designation and administration of national parks. If the National Parks Commission were provided with adequate resources and the local authorities were no longer liable to be called upon to finance national projects out of local rates, the extent to which co-operation already exists, and the support which the preservation of amenity already enjoys, indicate that with the disappearance of the clash of interests and loyalties much more rapid progress would be possible Apart, however, from noting that the Minister of Housing and Local Government has now made regulations authorizing the payment of exchequer grants to local authorities towards the cost of carrying out certain specified duties in national parks, the report scarcely refers to the financial aspect. The campaign for the use of the National Land Fund, as was originally intended, to finance national park operations is never mentioned.

---

* National Parks and Access to the Countryside Act, 1949 Fifth Report of the National Parks Commission for the year ending 30th September 1954 Pp iv+56+8 plates (London H M Stationery Office, 1954) 3s 6d net

The concern of the Commission over the slow progress in creating footpath agreements, however, does not arise from financial considerations This is well brought out by the Pennine Way, for which only twenty-four and a half more miles of rights of-way have been acquired, leaving some thirty-eight and a half miles to be acquired The difficulties which arose during the year in regard to three sections of this route were all in relation to alleged risks of pollution of water supply. One in the area of Holmfirth Urban District Council resulted in the Minister's upholding the Commission that, in view of the Huddersfield Corporation's resources of long storage, filtration and sterilization, the risks of harming the purity of supply were too remote to justify abandoning a route devised for the safety of walkers. The Commission still hopes to find a path in the area of the Colne Valley Urban District Council which will be acceptable to all parties, but the third dispute, in relation to a proposed path in the area of Crowden in Longdendale, raises difficulties which are exacerbated by the Minister's decision, announced on December 30, 1954, to uphold the objection of the Manchester Corporation.

Mr. Duncan Sandys's decision was based on his acceptance of the evidence that in certain circumstances the waters from Crowden Great Brook pass quickly into the public water supply, the safety of which then depends solely on the sterilization and on the original purity of the water Quite correctly, the Minister refers to the stress laid by the Gathering Grounds Sub-Committee of the Central Advisory Water Committee in its report seven years ago on public access to gathering grounds, on the wisdom of having several lines of defence for the protection of public water supplies, but one of the reasons given in that report for permitting public access was that the most stringent control of public access could not eliminate risk of contamination, and that other means of protection were desirable Restrictions on public access were rejected because, while fallible, their imposition was liable to cause ill-will and reduce respect for more important restrictions

While disregarding the advice of independent expert opinion in this way, the Manchester Corporation has adduced no convincing fresh evidence that the risk of contamination is serious, and it ignores the risks attached to footpaths which are much more frequently used both in the Greenfield and Longdendale valley in the Thirlmere and Haweswater catchment areas The acceptance by the Minister of the Manchester Corporation's proposal carries disturbing implications This reversal of a policy pursued without demonstrable risk for more than half a century and supported by independent expert opinion will not engender the goodwill and public co-operation on which the Heneage Committee rightly laid stress. Moreover, the absence of any attempt to deal urgently and effectively with the risk which the Corporation alleges to exist, by means which expert opinion regards as effective, exposes the Corporation to adverse comment

The observations of the National Parks Commission on the decision have yet to be made public, but th situation will doubtless be discussed in its next annua report. Meanwhile, the scientist will note a furthe example of the disregard, by a local authority, o expert opinion and national interests when the clash with local convenience or interests Th Minister's decision, moreover, will arouse doubts a to the soundness of his concern for the purity o public water supplies and the genuineness of hi interest in access to the countryside.

There is some slight resemblance between th dispute and that over the erection of a televisio station at Hessary Tor in the Dartmoor Nationa Park, where the Minister's decision to grant per mission, subject to agreement, *inter alia*, on detai of siting with the local planning authority, also run counter to technical advice submitted on behalf o the National Parks Commission by Sir Rober Watson-Watt The Commission is clearly unhapp at this over-ruling of the claims of amenity in national park area. It observes in another connexio when the local authority reversed an agreed decision "if all planning authorities acted in this way, amenit considerations would be likely to receive little mo than lip service, since all an Electricity Board woul need to argue, in order to bring the authority t consent to a particular scheme, is that they will n proceed unless they are allowed to do so in the wa they proposed"

Parliament, however, has made the National Par Commission responsible for bringing to the attenti of Ministers any development the effect of whi appears likely to prejudice the beauty of any are especially where that area is in a national par Planning authorities carry a similar responsibili for their own areas, and the Commission right holds that that duty is not properly discharged unle the claims of amenity are placed before Ministe with the right degree of emphasis That wou indeed ensure that the responsible Minister is possession of all the pertinent evidence, where vari public interests are in conflict, before arriving at decision. It does nothing, however, to remove t objection that the responsible Minister may be jud in his own cause.

In addition to more than one thousand proposals or electrification referred to the National Parks ommission for comment during the year by various rea boards, the Commission was consulted by the ritish Electricity Authority on national electricity chemes relating to power-stations or the super-grid he Commission recognizes that the area boards are ot unresponsive to the claims of amenity, and sually the Commission has been able to assent to e proposals or to agree on modifications which have ssened the damage to the amenities, though it ust be admitted also that sometimes the authority the boards have been negligent in their public lations duties Nevertheless, the Commission is metimes obliged to dissent, and it is now apparent at, particularly in relation to proposals for over-ead lines, the Commission is, in present circumances, liable to be placed in an impossible position here the electricity authority refuses to proceed ecause of the additional expense of putting cables derground, the National Parks Commission is ced with either abandoning its responsibility for e protection of amenity, or the areas concerned ay be deprived indefinitely of electricity supply

What is involved is well shown in the dispute over e supply of electricity to Borrowdale, Patterdale d Langdale in the Lake District National Park he Commission refers to the Borrowdale and Langle schemes in the present report, and the proposed pply schemes are being discussed with the Lake istrict Planning Board The North Western lectricity Board has, however, since submitted to e planning board a scheme for extending the pply line in Patterdale which will involve more an four and a half miles of new line, all carried ove ground on poles or pylons Mindful of its atutory duty, the planning board has suggested stead that the line shall run underground for three its four and a half miles What is said in the ational Parks Commission's report indicates that e electricity board is likely to answer that if the e is put underground the whole of the additional st must be borne by the individual customers pplied and that it cannot be spread over a larger ea. Few of the prospective customers, some of om have been waiting for thirty years for the pply, can afford to pay several hundred pounds tra, and unless the planning board gives way, e scheme will be dropped again The position is gravated in the Lake District, because, unlike me regional electricity authorities, the North estern Electricity Board has consistently declined spread the cost of a short stretch of underground e over the whole of a large project In consequence, the planning authority refuses to sanction overad lines, the electricity board refuses to proceed ere is no public inquiry at which the matter can thrashed out, and the planning authority incurs loquy for doing its statutory duty.

This dilemma, however, is arising repeatedly, and t only in the Lake district, like the clash over e administration of the national parks, it arises entially because the National Parks Commission and the national park boards have no real financial resources of their own It is reasonable enough to argue that when the national interest in natural beauty conflicts with some local need like that for cheap electricity, the extra cost of reconciling beauty with the local need should be met by some contribution from national funds The National Parks Commission and its various Park Planning Boards would be the logical instruments for any such payments, but they have neither the statutory powers to make payments, nor the resources from which to do so, at any rate until the National Parks Commission receives the assistance from the National Land Fund or some such source which Mr Hugh Dalton specifically promised when the National Parks and Access to the Countryside Act was passed

The National Trust and the Youth Hostels Association are already benefiting from the National Land Fund, and it has been strongly urged that the National Parks Commission should be supported from the same source Adequate finance would go far to remove some of the existing opposition to the work of the Commission and would facilitate a more vigorous educational campaign to remove misunderstandings which hinder it and prevent the full public co-operation upon which the success of its work ultimately depends Perhaps the most discouraging feature of the present report is that the Commission seems to accept tacitly the parsimony which thus hinders its work—which has delayed into its fifth year, for example, the appointment of a second assistant field officer, bringing its technical staff to three

There is in this report ample evidence of successful efforts to prevent or minimize disfigurements of natural beauty, of co-operation from local authorities and other public bodies and quiet persistence in the task of public education. The Commission itself recognizes that its efforts to make the national parks better known and understood require increasing help from other bodies and individuals concerned with the beauty and preservation of the countryside, and that much has still to be done, especially among young people, to create a wide public awareness of the nature and purpose of the national parks in Great Britain But one looks in vain in this report for any evidence that the preservation of amenity is regarded as a real national interest by the Minister himself, still more by the Government as a whole While, however, the Government regards national parks or nature reserves and the preservation of natural beauty as something to which no more than lip service need be given, the danger persists that departmental interests will irretrievably destroy them. No ministerial discouragements can really absolve the National Parks Commission for its failure, in reviewing the first five years of its work, to insist on the over-riding need for a short amending measure to the Act, which, taking into account that experience, would endow the Commission with the financial resources it needs, and help to restore its pioneering spirit.

PHYSICAL CHEMISTRY OF HIGH POLYMERS

Principles of Polymer Chemistry

By Prof. Paul J. Flory. (The George Fisher Baker Non-Resident Lectureship in Chemistry at Cornell University.) Pp. xvi+672. (Ithaca Cornell University Press, London Oxford University Press, 1953) 68*s*. net

IN 1935, the Faraday Society held a General Discussion on the subject of polymerization and condensation. At that time it was still possible to debate seriously whether natural and synthetic polymers could properly be regarded as strictly comparable materials, the properties of which were to be understood in terms of ordinary physicochemical principles, applied to long-chain molecules. This Discussion may be considered to mark the beginning of the surprising growth of polymer science which has taken place in the past twenty years. This same period coincides with the research activity of Prof. P. J Flory, who now, in the book under review, presents a systematic account of these developments. Flory's own contributions to polymer science have been both profound and extensive. In 1937 he set out clearly the now generally accepted principles of vinyl polymerization processes In 1942, he evaluated the entropy of mixing of high polymers with liquids He has made notable contributions to our understanding of the equilibrium and flow properties of polymer solutions, of polymer crystallization, and of rubber elasticity. A book by Flory will therefore command wide attention, and it is safe to say that its readers will not be disappointed

The plan and scope of the book reflect the author's interests, and, as its title indicates, it is concerned with physico-chemical principles rather than with the presentation of detailed factual information As a text-book for a postgraduate course on polymer science it could scarcely be bettered, while as a reference book it provides a theoretical background to current research activity and applications of high polymers

Following two introductory chapters, the author deals first, in Chapters 3–5, with the mechanisms and kinetics of polymerization reactions, discussing in turn polycondensation, free-radical polymerization, copolymerization, and (briefly) ionic polymerization. These chapters, in conformity with the plan of the book, discuss the principles involved, and quote ample illustrative data, but do not compete with or replace the more specialized texts on polymer reactions

The next main section of the book (Chapters 6–9) is broadly concerned with the structure of polymers, both linear and cross-linked, with especial reference to the determination and distribution of molecular weights. The various experimental techniques are adequately outlined, but the main thread of argument is provided by thorough discussion of the principles of the methods, the origins of molecular-weight distribution, and the correlation of theory with experiment. The application of these methods to specific polymers and the compilation of detailed results have very reasonably been held to lie outside the scope of the book

In Chapter 10, the author turns to the problem of chain configuration, outlines the random flight approximation and discusses briefly some of the restrictions imposed by bond angles and rotation barriers. Discussion of rubber elasticity follows naturally in Chapter 11, and here, as elsewhere in the book, the author has chosen to develop the subject simply and systematically without interrupting his argument to discuss disagreements in points of detail which have been expressed by different workers in the field

Chapter 12 contains a statistical derivation of the thermodynamic properties of polymer solutions The limitations of the elementary lattice treatment are dealt with and the excluded-volume problem discussed by Flory's own method based on the analogy betweer polymer solutions and imperfect gases. The usefulness and power of these methods are illustrated by reference to a few well-chosen examples.

Chapter 13 is entitled "Phase Equilibria", and i concerned in the main with the applications o the results of Chapter 12 to problems of polyme solubility, fractionation and swelling. Polyme crystallization is discussed in a surprisingly shor section of a dozen pages.

The final chapter contains a concise but ver satisfying account of the important though difficul problem of the viscosities of polymer solutions. Here as throughout the book, the treatment is essentiall original, the contributions of various workers bein interwoven and often illuminated by the author' systematic presentation No attempt has been mad to review the vast literature which has grown aroun the empirical use of viscosity as a measure c molecular weight

This book can be unreservedly recommended t beginners and experts alike Although it would b easy, as the author himself points out, to mentio subjects which have been omitted, the field covere is very broad Readers unfamiliar with the method of statistical thermodynamics will find some section difficult without supplementary study, but physic principles are never submerged in mathematic Clarity of expression and depth of physical insigh are outstanding characteristics of the book, as the have been of Flory's research papers All workers i polymer science owe him a debt of gratitude for th monograph

G. GEE

MAXWELL'S THEORY AND SOM OF ITS APPLICATIONS

Electromagnetics

By Prof. John D. Kraus. (McGraw-Hill Electric and Electronic Engineering Series) Pp. xiii+60 (London McGraw-Hill Publishing Co , Ltd., 1953 76*s* 6*d*.

MANY years ago, the reviewer overheard a co versation between two colleagues about recently published book, when one of them remarke "If one masters Maxwell's theory the book can read like a novel". At that time there were n many people who could boast of mastering th theory Some years earlier, as Michael Pupin tells his autobiography, he came to England and tried get information about Maxwell's theory but co not find any university here to help him and had go to the Continent and to study with Helmholt But times have changed since then, and there ex at present, besides Maxwell's original work, wh perhaps is not easily understood, quite a few co prehensive treatises on electromagnetic theory.

In spite of this fact, the book under notice should have many readers who want to acquire a sound foundation for a thorough knowledge of the subject It is written in a fluent style by a scientist possessing outstanding pedagogic skill It is intended for students acquainted with general physics, the elements of calculus and to some extent with vector analysis, although vector concepts are lucidly developed in the book so far as they are needed But the book is also very suitable as a work of reference for research workers The author stresses throughout the importance of using dimensional relations of the quantities concerned for checking the correctness of equations between them The rationalized Giorgi system of units is applied based on the metre, kilogram and second, with the coulomb used as fourth fundamental unit

The book contains nearly four hundred well-chosen and very clear illustrations, many worked examples within the text and numerous problems at the end of each chapter Field mapping methods are shown n their application to electric and magnetic fields as well as to current, heat and fluid flow

The first two chapters deal with the static electric field, starting with Coulomb's law and deriving Gauss's law on the relation between electric flux density and charge In the second chapter the capacitor, coaxial, two- and single-wire transmission lines, Maxwell's divergence equation and the equations of Poisson and Laplace are discussed. In the third chapter, dealing with the steady direct current, the laws of Ohm, Kirchhoff and Joule are discussed and the relevant current parameters are defined. Finally, Laplace's equation for conductive media is given. The fourth and fifth chapters deal with static magnetic fields in air and in ferromagnetic materials, espectively The magnetic field is here introduced not as that of a permanent magnet but as that produced by a steady current, while permanent magnets and Coulomb's law for magnets are dealt with much later Flux and flux density, magnetic moment, solenoids, inductors and inductance, permeability, magnetizing force and magnetomotive force are defined Then Biot-Savart's and Ampère's laws are stated in the usual form and, after a brief xplanation of the vectorial product and its proprties, also in vector notation Ampère's law is given onnecting the magnetizing force of a loop with the urrent enclosed and, after explaining the notion of url, it is stated in the form given by Maxwell though n the more modern vector notation. In the sixth hapter the effect of electric and magnetic fields on harged particles is discussed and the cathode ray ube, the cyclotron and the mass spectrograph are reated as examples While these first six chapters were concerned with static and steady states, fields hanging with time are introduced in the seventh hapter Faraday's law and its mathematical expresion due to Maxwell are given, and the betatron and he fluxmeter for the measurement of magnetic fields re briefly described Here, as elsewhere, Maxwell's otion of the displacement current is given due onsideration

Chapter 8 gives a summary and tables of all the Maxwell equations in their integral and differential orms, first for the general case, then for free space, or harmonic variation and for steady and static tates

The rest of the book is dedicated to selected pplications of Maxwell's theory. In Chapters 9 and 0 the plane waves in dielectric and conducting media are discussed, wave equations are derived and some of their solutions are given The difference between phase velocity and group velocity is lucidly illustrated by the movement of a caterpillar The Poynting vector and its uses are introduced Chapters 11–13 deal in greater detail with transmission lines, with wave guides and antennæ respectively, and the last chapter is devoted to boundary-value problems At the end of this chapter a brief introduction is given to the method of conformal transformations

As in dealing with the solution of wave equations in cylindrical and spherical co-ordinates use is made of Bessel, Neumann, Hankel and Legendre functions, these are briefly discussed and partly illustrated in the appendix Besides this, the appendix contains a detailed table of the units used and their dimensions, a section on field-mapping technique, a table of dielectric materials and various mathematical relations A bibliography and a combined name and subject index conclude the book

This survey of the contents of the book shows how much information can be found in it Two slight omissions may be noticed In dealing with the Poynting vector, a conversion formula is used connecting the divergence of a vector product with the curls of its factors The formula is also to be found in the appendix, but no proof is given for it Of course, it may be verified easily by applying the definitions of divergence and curl and the rules given in Chapter 4 for the cross-products of unit vectors Also the vector identity used in the section on the general development of the wave equation is not proved Perhaps in a second edition the proofs might be given in the text or used as set problems in Chapter 4 But these are very minor criticisms of a well-produced book which may be strongly recommended

R. NEUMANN

AUSTRALIAN ORNITHOLOGY

The Literature of Australian Birds

By Major H M. Whittell. Pp 788+32 plates (Perth, W Australia Paterson, Brokensha, Pty, Ltd, 1954) £A 3 10*s*

ALTHOUGH Australia has been settled by Europeans since 1788, little serious attention has been paid to the study of its birds For this there are two primary reasons First, there has been in Australia no hard core of scientifically trained zoologists interested in the group such people, in a young country, have generally almost inevitably gravitated into economic zoology Secondly, bird-watching has never become popular In some respects this is very good, in that it makes it possible, in an Australian capital city, for an experimental scientist to trap sparrows, starlings or other pests without being assailed by protesting fanatics In another respect, it is unfortunate in that there has never developed there any large corpus of serious and gifted amateur ornithologists of the sort who have done such valuable work in Great Britain in the past fifty years

So it is that the late Major H M. Whittell has been able to include the whole literature of Australian birds from 1618 to 1950 in one moderately bulky volume This fine bibliography is the result of many years painstaking work in metropolitan newspapers as well as technical journals The perusal of the former is a sad necessity because the press of early Colonial days sometimes published the initial descriptions and names of new (or supposedly new) species given by pioneer museum men who rushed accounts into local newspapers in order to get priority.

Major Whittell's book is divided into two parts covering the periods 1618–1850 and 1850–1950. The first is of particular interest in that it deals with the accounts of the great naturalist-explorers in what can almost be called the pre-laboratory era. It relates little-known information brought back by the early Dutch navigators, including the log-record of Antonie Caen, of the *Banda*, who in 1636 found (as did De Vlaming, of the *Geelvinck*, sixty years later) that the supposedly fabulous black swan was a reality, and not even a rarity, after all. There is included, too, much of other early information brought to Europe by French naturalists, and by the English buccaneer Dampier, and, of course, that obtained by Cook on his various voyages. There are data recorded by gifted early convicts and free-settler artists and naturalists, and the labours of Robert Brown (of Brownian movement), Charles Darwin, T. H. Huxley and many others have not been forgotten.

The second and longer part is devoted to the condensed autobiography and complete bibliographies of individual naturalists.

"The Literature of Australian Birds" will be, no doubt, expanded as new documents come to light, but it is unlikely to be replaced and must, in fact, be indispensable to anybody interested in ornithology of the Australasian region. It is much to be regretted that its author, an English officer who first studied zoology in his youth under Cossar Ewart, and who decided to live in Australia after the First World War, did not live to see its publication. The only serious defect in the first edition is the lack of a species index. It is sold in paper covers in order to reduce expense. A. J. MARSHALL

DEVELOPMENT OF INDIAN PHARMACY

History of Indian Pharmacy

By G. P. Srivastava. Volume 1. Second edition. Pp. xvi+277. (Calcutta: Pindars, Limited, 1954.) 12 rupees, 8 annas; 2.50 dollars.

THREE different systems of medicine have been practised in India since early times. The most ancient system, the Ayurvedic, was the original system which owed nothing to external influences. It was practised until about the end of the twelfth century A.D. From that date until the end of the eighteenth century it was augmented or supplanted by the Arabian system, the Unani Tibi. At the end of the eighteenth century the modern Western system was introduced by the British. The first volume of this work—all that is published so far—deals only with the Ayurvedic system, and this second edition has followed very rapidly on the first.

The two great works of Indian medicine are the Charaka-Samhita and the Susruta-Samhita. The eight sections of Charaka's work deal fairly comprehensively with the preparation and use of drugs, and the treatise by Susruta extends this practice and also deals with surgery. There have unfortunately been wide discrepancies in the dates assigned to these two treatises. The author adopts the dates 1000–800 B.C. for Charaka and 1000–600 B.C. for Susruta. In his foreword, Dr. Urdang points out that the Chronology Committee of the National Institute of Sciences in India has recently accepted the dates A.D. 100 for Charaka and A.D. 200–500 for Susruta. Reference shows, however, that the report of the Committee which Dr. Urdang quotes is very brief, and it obviously indicates that the Committee based its findings largely on the fifty-year-old work of Winternitz. This matter is important in view of the possibility of the influence of Hindu medicine on the Greeks. The author contributes a few interesting points to this practically insoluble controversy.

In writing this book, Mr. G. P. Srivastava has leaned rather heavily on the standard works by Mukhopadhyaya, Dutt, Ray and others. But these works are now difficult to obtain, and the author has rendered a service by providing something more than a summary of the available material. Its value compensates for the slight quaintness of the English. It should be corrected by a European scholar before the next edition, and obvious misprints and errors—such as the 'three' humours of the Greeks, 'Gallen' for 'Galen'—should be removed. Despite these blemishes this book, which is written with enthusiasm and sincerity, will be found useful. There is an excellent index. E. ASHWORTH UNDERWOOD

PROJECTIVE AND METRIC GEOMETRY

Projective Geometry and Projective Metrics

By Herbert Busemann and Paul J. Kelly. (Pure and Applied Mathematics Series.) Pp. viii+332. (New York: Academic Press, Inc.; London: Academic Books, Ltd., 1953.) 6 dollars.

MUCH of this book differs widely from other treatises on geometry. The first three chapters are on lines which are now usual. Projective geometry is treated from the algebraic point of view. The authors consider that synthetic methods have lost their appeal for the present generation, especially in the United States, where there is a tendency to consider generality as the only criterion of value. After two chapters dealing with lines and conics in the projective plane, there is a third chapter dealing with the closely related affine geometry. The surprise for the reader comes in Chapter 4. This opens with a discussion of abstract metric spaces, in which for every two points there is some definition of distance though possibly quite different from the usual one. From the great variety of such spaces two special kinds are distinguished—Minkowskian and Hilbert's. Euclidean geometry reappears as a particular case of Minkowskian, and the non-Euclidean hyperbolic geometry of Lobachevsky is a particular case of Hilbert's. The fifth chapter considers non-Euclidean geometry, both hyperbolic and elliptic, in detail. In these two chapters there is a good deal about motion, area and perpendiculars.

The sixth and last chapter, entitled "Spatial Geometry", extends the results of the preceding five chapters from two to three dimensions, but it is written in a different style, intended as seminar work for the more mature student. Instead of the explicit exercises of the preceding chapters, the student is here asked to supply for himself the proofs of many of the theorems. The book concludes with a short bibliography and an eight-page index.

H. T. H. PIAGGIO

Seismic Prospecting for Oil

By C Hewitt Dix. (Harper's Geoscience Series) Pp. xx+414 (New York Harper and Brothers, London Hamish Hamilton, Ltd., 1953) 63*s*

AMONG geophysical prospecting methods, the seismic has now, and will probably retain, a favoured position ahead of all others. Gravity, magnetic and electric methods have their value, but successful interpretation is very uneven Recently, airborne magnetic surveys have given some useful general indications, but too much should not be claimed, Dr. Dix writes that their value "can hardly be overestimated", surely an over-statement of considerable splendour.

The success of the seismic method has been outstanding, but failures have also been many and costly Where conditions are simple and favourable, high-grade reflexions are obtained and no great skill is required to read the records, as with echo-sounding at sea where there is only one reflector and one simple medium At the other end of the scale, structure and strata may be so complex that the method must accept defeat, but the average experience is intermediate Many apparent seismic failures are, in fact, failures of interpretation, the more complex the conditions the more the skill required of the operator and the greater the personal factor in the final appraisal The chapters on interpretation, embodying the author's considerable experience, are the important practical contributions of this book, for the rest it has the marks of hasty assembly and, by the author's own admission, was dictated around his text figures The concluding section is a summary of the basic physics "written primarily for seismologists interested in the interpretation of seismic results"—implying that many are not so interested

[The late] G M Lees

General Chemistry

By Prof. W. F. Luder, Dr Arthur A Vernon and Prof. Saverio Zuffanti. Pp xiii+595. (Philadelphia and London W. B. Saunders Company, 1953.) 30*s*

IN this introductory chemistry for American university students, the authors cope with the vastness of the science by laying special emphasis on hose theoretical ideas which are of great significance for the understanding of chemical behaviour. Accordingly, after five chapters on elementary terms, processes and definitions, they build into a light framework of illustrative matter a thorough treatment of the periodic system, the electronic theory of valency and the new conceptions of the terms acid and base Other points of theory are included but not treated so fully Moreover, for their instructional value, attention is directed to the worth of Gardner's form of the periodic table—more customary forms are also given, to the system of exhibiting the properties and relationships of the elements by the author's atomic structure chart, and to such elpful generalizations as the classification of the elements based on the positions of the differentiating lectrons

The conception of an acid is treated in an equally thorough way and includes the discussion of the ater, the proton and the electronic definitions Then, in the next twenty chapters, appropriately itermingled with more theory, the elements in their eriodic groups are briefly studied After this we find four chapters on organic chemistry, one on analysis, and six on the metals The lanthanide and actinide series are included, and there is a good and unusual chapter on the systematic properties of related and similar metals Copious illustrations, sets of questions, numerous references to supplementary reading—many from the *Journal of Chemical Education*—and the use of the electronic theory throughout the book, combine to make this a stimulating text for first-year university students or for those studying for university scholarships G Fowles

Detailed Descriptions of Varieties of Wheat, Barley and Oats recommended by the National Institute of Agricultural Botany

Pp. 98 (Cambridge National Institute of Agricultural Botany, 1954) 20*s*

THIS publication, giving the full descriptions of the fifty cereal varieties on the Recommended Lists of the National Institute of Agricultural Botany for 1954, takes the form of a loose-leaf pocket handbook A single page is devoted to each variety so that reference is simple, and additions or deletions readily made, for it is hoped to prepare further pages when new varieties appear on the Lists Since it is primarily intended for use by inspectors of seed crops for identification purposes, the greater part of the information is concerned with the detail of the inflorescence and grain. Excellent explanatory diagrams showing the main recognition characters, and a glossary of the more important botanical terms are included to help the less highly trained reader The publication should also be valuable as a general reference book, for under the heading "General Information" a brief account is given of the origin of each variety and its properties, such as maturity date, disease resistance and tendency to lodge or sprout in the ear In addition, there are comments on milling, baking, malting and brewing qualities It does not, however, attempt to replace the current leaflets of the Institute, to which reference for full particulars of the use of the varieties should continue to be made. The handbook is a convenient size, printed on good paper, with a strong, serviceable cover K. W

The Pocket Guide to Nests and Eggs

By R S R. Fitter, assisted by the Hon. Guy Charteris Pp xv+172+48 plates (London. William Collins, Sons and Co., Ltd., 1954.) 21*s* net.

THE beginner in bird study, whether young or not so young, has no lack in these days of books to help him on his way. This book is frankly for the tyro, to whom it should be of considerable assistance, but experienced field naturalists will also find it of interest However, it was obviously the needs of the novice that the author had in mind, as witness the way his descriptions are divided into "Land Birds", "Waterside Birds" and "Water Birds", and each section is further subdivided into 'very short', 'short', 'medium short', 'medium', etc. Mr Fitter's descriptions of nests and eggs, in which he has been assisted by Mr Guy Charteris, are concise and accurate, while Mr R. A Richardson has supplied excellent colour plates, black-and-white plates and line drawings in the text, though the exigencies of colour reproduction have been a little unkind to the artist here and there, for example, the much too scarlet breast of the robin and the bright red flank of the redwing Nevertheless, the book should achieve its object and help the novice name the nest and eggs he discovers in the course of his rambles

Frances Pitt

FIRST OBSERVATIONS ON A LIVING CŒLACANTH

By Prof J MILLOT

Director, Institut de Recherche Scientifique de Madagascar

THE organization for the fishing and conservation of the Cœlacanths of the Comoro Islands created by the Institut de Recherche Scientifique de Madagascar, with the invaluable support of the Administration supérieure and of the Commandement de l'Air, reports a new success on November 12 last a further *Latimeria* was captured at Anjouan This brings the total since 1938 to eight and is the finest yet, as regards both size and state of preservation, and by far the most interesting because it is the first near-adult female specimen which has come into our hands as well as the first of these precious fishes which anyone has been able to observe alive, for although an Italian expedition claimed to have photographed one last year, at 15 metres depth, the circumstances were quite incredible.

As a matter of fact the principal objective, once an adequate number of specimens for anatomical investigation had been acquired, was to capture a living one and keep it alive sufficiently long to make the biological observations desired This was a difficult proposition Hitherto, almost as soon as the fish had been brought to the surface, the fishermen had promptly battered it to death with oars or dispatched it with harpoons or knives in order to prevent it from struggling, and to be able to hoist it into their narrow pirogue without too much trouble We had to put a stop to this deplorable behaviour and, on the contrary, persuade them to do their utmost to bring the fish, alive and uninjured, to the nearest harbour This they were never willing to attempt, fearing, not without good reason, that on the way a shark or a shoal of barracuda might wrest their prize from them and lose them the promised reward It took a great deal of persuasion to obtain their compliance, with an express promise that should they be successful the reward would be doubled

We, for our part, had to ensure a prison containing a sufficient quantity of sea water for the captive fish At first the provision of a fishpond on the seashore was considered, but on these rugged shores the work of constructing one would certainly be difficult That solution had, besides, the inconvenience of creating a predetermined and immovable rendezvous although the place of the next capture could not be foreseen Used as a kind of aquarium, a sunken small boat seemed to have many advantages to commend it—cheapness, simplicity, rapid installation, mobility—and it was decided to adopt this course.

The eighth *Latimeria* was pulled in from 140 fathoms depth (255 metres) at 20.00 hr. on November 12 by a fisherman, Zema ben Said Mohamed, assisted by Madi Bacari, both of the Maijihari quarter of Mutsamudu Their pirogue was then about 1,000 metres offshore, opposite Mutsamudu jetty. The sea was very calm and the tide ebbing, it was two days after full moon and the moon had just risen.

By the way in which the fish had taken the bait, the usual hunk of 'roudi' (*Promethichthys prometheus* (Cuvier)), Zema, an excellent fisherman, immediately guessed that it must have been a Cœlacanth Nevertheless, he took half an hour and every precaution over hauling it in and, having made sure that it
really was a *combessa* (the local name for the fis
he decided to try for the double reward by keep
it alive He succeeded, "en le tenant par la main",
he said, in passing a cord in through its mouth a
out through the gill-opening, and by means of t
cord and of the line (which remained attached to
centre of the anterior part of the floor of the mou
he led the creature all the way back to Mutsamu
jetty, though sometimes it was the fish that tow
the pirogue.

Administrateur Lher, as soon as he had b
notified (it was by then 20 50 hr.), decided, as we
agreed in advance, to sink a whaler immediately
which to place the *Latimeria* and keep it under
least unfavourable conditions practicable
receptacle was ready by 21 30 hr and anchored a
few tens of metres off the end of the jetty
basin of sea water so contrived measured ab
7 metres long by 1½ metres wide and 80 cm. de
The bung had been removed from the bottom
the boat, so as to provide a small but continu
current of water Besides this, every half-hour
boat was violently rocked in order to renew
greater part of the water A net covered the top
the whaler to prevent the Cœlacanth from escap
which it never seemed to want to do The green
yellow luminescence of its eyes was very pronoun
and could be seen at quite a distance The col
of the fish was very dark greyish-blue, recalling t
of the steel of a watchspring, with fins having clea
grey-bluish reflexions

Throughout the night—which the delighted po
lation of Mutsamudu passed in singing and danc
to celebrate the capture—the Cœlacanth
watched over with admirable care by the chef
circonscription, taking turns with his adjoint,
Solère. It seemed, although quite bewildered at
sequel to its ascent to the surface, to be taking
situation very well, swimming slowly by curi
rotating movements of its pectoral fins, while
second dorsal and anal, likewise very mobile, ser
together with the tail as a rudder

After daybreak it became apparent that the lig
and above all the sun itself, was upsetting the anim
very much, so several tent canvases were put o
the boat to serve as some kind of protection
despite this precaution and the more or less const
renewal of the water, the fish began to show m
and more obvious signs of distress, seeking to conc
itself in the darkest corners of the whaler

At 14 45 hr. it was still swimming feebly, but
15 30 hr it had its belly in the air and only the f
and gill-covers were making agonized movements

It was then covered with a sheet and tak
immediately to the hospital. There was not a scra
on it, apart from a tiny incision in the centre of
anterior part of the floor of the mouth made by
fisherman when recovering his hook Altogether
was in remarkably good condition, without a
rupture of the viscera or suffusions of blood.

It measured 1·42 m in length and weighed 41 kg

Chemical and histological investigations could
made under the best possible conditions on perfec
fresh tissues

Notified by telegraph of the capture and rushed from Tananarive by a special aircraft, I arrived just in time to witness the last moments of the fish

Two principal conclusions emerge from the corroborated statements made by local observers and by myself (1) the extreme photophobia of *Latimeria*—the sunlight seemed literally to hurt it, (2) the exceptional mobility of the pedunculate fins, correlated with the wealth of musculature which is revealed by anatomical studies The pectorals, in particular, can move in almost any direction and show themselves capable of assuming practically every conceivable position.

There can be no doubt that death was brought about by decompression combined with rise in temperature The previous water-samples taken by Menaché (1953) and by Millot and Cousteau (1954) n the precise positions in which previous captures had been effected showed important temperature differences between the stratum frequented by the Cœlacanths and the surface water (26° C., more or ess) during the daytime off Moroni or Mutsamudu.

It must also be noted that the *Latimeria*, which appeared greatly distressed on its arrival at the surface, seemed to have recovered appreciably after an hour or so and passed the rest of the night quite comfortably without any too obvious inconvenience It was daybreak, with the appearance of sunlight and the gradual warming of the water, which initiated the progressive discomfort that led rapidly to its death

The trial having thus been made under satisfactory conditions, it does not seem likely that substantially better results can be anticipated from the employment of the same technique in future We must be prepared to make other arrangements. The only procedure offering any hope of keeping a live Cœlacanth for a longer time would seem to be the construction of a great trellis-work cage in which we could place the fish immediately after its capture, here we should keep it normally submerged at a depth of 150–200 m., and only haul it up for limited imes when someone wanted to observe or photograph he animal Such a cage will be put in hand at Anjouan.

[Translation by Denys W Tucker, British Museum Natural History).]

NUTRITIVE VALUE OF BREAD

THE controversy about the relative values of 'brown' bread and 'white' bread seems to be ternally with us, largely due to the failure of the rotagonists on either side to appreciate that neither brown' nor 'white' is constant in composition and, till more important, that bread is rarely the only em in the diet. The nutritional value of a diet is, f course, determined by the total mixture of items n it, and their combined ability to meet the particular needs of the individual concerned These eeds are also not constant but vary according to ge, sex, activity, body-size phase of development, ate of health, past history of the organism and resent environmental conditions Very few workers rovide sufficient data about these various factors to ermit valid comparisons between the results of one xperiment and another, and it is a great pleasure o read the careful and closely argued report now resented by Widdowson and McCance dealing with the work they undertook in German orphanages after the Second World War*.

Five different flours were used (1) 100 per cent extraction, (2) 85 per cent extraction, (3) 70 per cent extraction, (4) 70 per cent extraction enriched with thiamin, riboflavin, nicotinic acid and iron up to the level of whole wheat flour, and (5) 70 per cent extraction enriched with these four nutrients up to the level of 85 per cent extraction flour All five were fortified with calcium carbonate In one orphanage the flour (mainly in the form of bread) provided approximately 75 per cent of the total calories, in the other it provided only 35 per cent, extra fat and sugar being given to provide another 35 per cent, and the residue of the diet, in both cases, being made up from the German rations provided locally. In addition, all children were given daily vitamin supplements consisting of 2,000 i u. of vitamin A, 1,000 i u of vitamin D and 25 mgm. of ascorbic acid

Some three hundred children were involved (both boys and girls) between the ages of four and fifteen, and the experiments continued throughout one complete year Many different observations were made, and a large number of chemical analyses were undertaken The authors state that "During the preliminary period, before the main experiments began, measurements of height and weight and of the girth of various parts of the body were made Each child was examined clinically, and a sample of blood was taken for the determination of hæmoglobin, hæmatocrit, serum protein and serum P-cholinesterase Radiological examinations were made of the gastro-intestinal tract and of the bones, and the teeth were inspected The children were weighed and measured every fortnight while the experiments were in progress, and they were examined clinically every three months At the end of the experimental year all the examinations which had been made at the beginning were repeated Studies of the intakes and excretions of nitrogen, minerals and of the B vitamins were also made on some of the children at intervals during the investigation".

The usual difficulty of a long-term experiment arose, namely, that individual children dropped out from time to time and so reduced the value of the initial matching of the different groups. The effects have, however, been carefully checked by various devices, and the authors are satisfied that it has not in any way invalidated their results

The two most important general findings were (1) that all the children did remarkably well, and (2) that no differences either in growth or in health could be detected between the groups receiving the different types of flour This, of course, does not mean that one flour is necessarily as good as another but merely that, in this series of experiments, one diet was (apparently) as good as another The qualification is necessary because there was some evidence that the children on the low bread diets (35 per cent of the total Calories) tended to become too fat, whereas the high bread diet produced a better all-round development The authors themselves say "The advantages of the [high-bread] diet would probably have become more obvious as the children approached maturity and might be still more striking in adult life".

---

* Studies on the Nutritive Value of Bread and on the Effect of Variations in the Extraction Rate of Flour on the Growth of Undernourished Children By E M Widdowson and R A McCance Medical Research Council, Special Report Series No 287 Pp viii+137+1 plate (London H M Stationery Office, 1954) 8s 6d net

At the beginning of the experiment the children were under-developed by comparison with American children of the same age , but during the experimental year they grew at a greater rate and so decreased the differences. In spite of this stress of abnormally rapid growth, no signs of specific vitamin deficiencies were detected in any group at any time, and radiological examination showed that bone development kept pace with the rapid increases in height and weight The only unsatisfactory finding was the prevalence of slightly enlarged thyroid glands, which persisted despite dosage of small amounts of iodine The authors suggest that this may have been due to the high calcium intake. It is perhaps also possible that the diet included goitrogenic vegetables

In general, however, it is clear that, on these diets, previously under-nourished children were able to make very satisfactory progress At the end of the year, a supplementary trial was run and a group of children in the first home were given 500 ml of reconstituted full-cream milk daily for six months This produced no detectable difference in growth-rate or physical condition from the control group, which continued on the previous high-bread diet.

Several commentators have already expressed surprise that the diets used should have produced such good results, and the authors themselves seem to have expected something different. Yet, in both homes, the diets were considerably better than most children throughout the world normally grow up on, and there does not appear to be any need for revising our conception of requirement levels as a result of this work

The diets were made up in the following way

Daily intake (gm)	No. 1	No. 2
Flour—		
100 per cent extraction	447	250
or 85 per cent extraction	437	—
or 70 per cent extraction	418	240
Potatoes	168	257
Fruit and vegetables	112	160
Meat, fish, cheese	24	34
Milk (mostly skim)	82	113
Butter and margarine	12	91
Sugar and jam	58	101

The children were able to eat to appetite and they averaged 2,000–2,500 Calories per head per day In the first diet, animal protein averaged 8–9 gm , but total protein ranged from 61–73 gm. , in the second, animal protein averaged 11 gm and total protein 51–55 gm In the first diet, fat averaged 22–29 gm as against a pre-war average of 92 gm. for British children. Even so, however, it was considerably higher than the amounts commonly obtained by children in many under-developed parts of the world

Ascorbic acid and vitamins A and D were maintained at a high level by the special vitamin supplements, and calcium by the addition of creta præparata (at varying levels) to all grades of flour used. Such supplementation is, of course, not normally available in other countries. The authors seem to think that the satisfactory bone and tooth development might not have been achieved without these supplements, and they point out that these may also explain the failure of the milk supplement to produce any further improvement, since "the present investigation is, in fact, the only one in which a milk supplement has been added to a diet known to contain plenty of calcium and vitamin D".

Increasing the refinement of flour (lowering the extraction-rate) primarily affects the values for iron, thiamin and nicotinic acid, and it is in relation to one of these that some evidence of deficiency might have arisen in the group receiving the refined flo The most common defect of high cereal diets in oth parts of the world, namely, a deficiency of riboflavi might also have been expected in the high-bre group with their lower intakes of milk, meat a vegetables Biochemical tests, however, showed th supplies of B vitamins were sufficient, but "t margin of reserve appeared to be small in the ca of the children eating unenriched white bread. T supplies of riboflavin were probably nearest to t margin of safety"

An important and unfortunate aspect of this wo is that the 70 per cent extraction flour that was us had a vitamin content above average for this type flour Had this not been the case, deficiency sig might well have appeared Failure to appreciate th point will inevitably lead to unwarranted deductio being drawn from the findings presented in th report, despite the continually reiterated warnings the authors In fact, the results of these experimen amply confirm the wisdom of the Post-War Lo Conference[1], which recommended that extractio rates should not be permitted to fall below 80 p cent, and that an 85 per cent level was to preferred.

The report contains a section dealing with t results of feeding the diets to laboratory anima and several valuable appendixes by different autho setting out the detail of the biochemical and radi logical investigations. M W GRANT

A MANDIBULAR FRAGMENT, PROBABLY OF THE SALDANHA SKULL

By Prof M R. DRENNAN and Dr. R SINGE

University of Cape Town

IN reconstructing the Saldanha skull-cap (s *Nature*, 172, 791 ; 1953), a few small fragmen were temporarily left out, because we did not ha all the pieces necessary to complete the 'jig-sa puzzle'.

Among these fragments was part of the ramus a mandible with the coronoid process on it , but colouring, especially on its inner aspect, differed fro that of the skull fragments, although the degree fossilization appeared to be identical It looked huma but it was somewhat out of the ordinary, and extra measure of caution in identifying it was nece sary, especially as it was found 500 yards away fro the main fragments of the Saldanha skull[1]

Closer inspection has now convinced us that t specimen is human, and we consider that it probab belonged to Saldanha man. It has a morpholo appropriate to the skull, and, by a coincidence, small piece of human parietal bone was found w it. Both pieces were collected by one of us (R. S), a it so happens that the parietal fragment had recently cracked edge which fitted perfectly corresponding fracture on the Saldanha skull

The remarkable feature of the mandibular fra ment is that it is almost identical in shape a dimensions to the corresponding part of the Mau jaw (Heidelberg mandible) (Fig 1) This latter ja is by far the oldest of the strictly human fossils, a

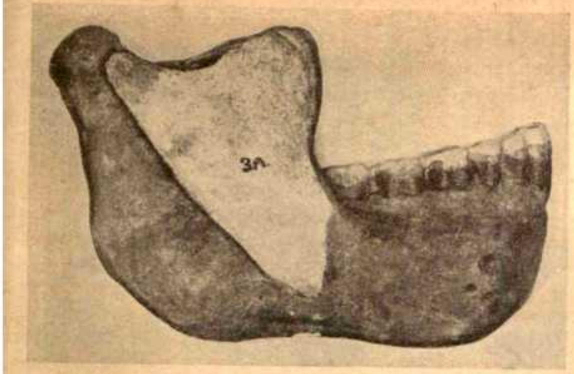

Fig. 1. The Saldanha mandibular fragment (3A) superimposed on a cast of the Heidelberg mandible

its massiveness and primitive features have kept it for long as an isolated enigma.

There has never been any doubt about the great evolutionary importance of this human prototype, and it is particularly interesting from the South African point of view, where the proportions of the square gibbon-like ramus of this mandible survive in a range of sizes in Bushman, Hottentot and pre-Khoisan jaws. For this reason we have less hesitation in reporting that our evidence, albeit precariously limited, suggests that Saldanha man possessed a counterpart of the Mauer jaw.

While commenting on the large size of the masticatory apparatus of Rhodesian man, the late Sir Arthur Keith[2] pointed out that the width of jaw which this skull required was identical with that supplied by the Mauer jaw; and he might also have added that the huge upper dental arch of the Rhodesian skull requires an even bigger arcade of lower teeth than the Mauer jaw exhibits. There was every likelihood, therefore, that the Rhodesioid Saldanha skull would have a Mauer-like jaw.

Owing to the incompleteness of this ramus, only one of the conventional measurements is available for comparison. This is the important one of the height of the coronoid process above the alveolar plane, the level of which can fortunately be located from the impression on this fossil of the posterior root of the third molar tooth (Fig. 2). This height measurement is 40 mm. in both the Saldanha fragment and the Mauer jaw.

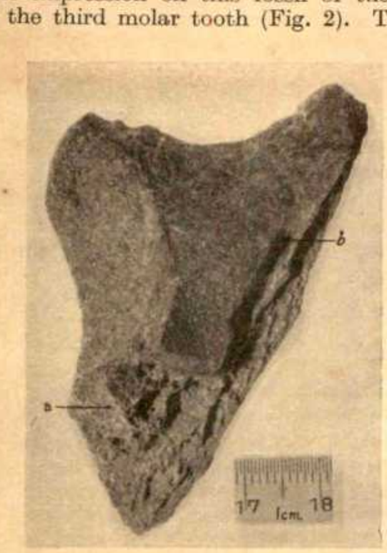

Fig. 2. Lingual aspect of the mandibular fragment, indicating posterior root socket of lower third molar (*a*), and the position of the mandibular foramen (*b*)

The ramus is fractured diagonally about half a centimetre behind, and parallel to, the inferior dental canal, so that it has been necessary to estimate the width of the ramus. For this, however, good guidance is available from the mandibular foramen, which is shown on the inner side of the specimen (Fig. 2). This opening for the nerve to the lower teeth occupies a fairly constant position relative to the borders of the ramus in jaws of similar type. In our collection of Bushman mandibles, there is an average of 59 per cent of the width of the ramus in front of the opening and 41 per cent behind it, and the same proportions are found in the Mauer jaw. By using these proportions, we estimate the width of the ramus of our specimen to have been approximately 49 mm. This is only 2 mm. less than the width of the Mauer ramus, and this small difference does not materially alter the fact that there is a close typological correspondence between them.

Our fragment is, however, definitely less robust than the corresponding part of the Mauer jaw. This is not unexpected when one considers that, old as both fossils are, the Heidelberg one dates from the beginning and the Saldanha one from towards the end of Chelles-Acheulean (handaxe) times.

The interesting thing is that, while in Europe there is evidence (Swanscombe and Fontéchevade skulls) that man evolved into a sapient type during that long epoch, Saldanha man, on the other hand, has apparently remained typically palæoanthropic in both skull and jaw.

DISLOCATIONS, WORK-HARDENING AND CREEP*

By Prof. N. F. MOTT, F.R.S.
Cavendish Laboratory, Cambridge

MY aim in this lecture is to describe in outline the present state of the theory of work-hardening of metals and to propose some new ideas about recovery and creep. What I shall say is based on the theory of dislocations, and indeed is derived very closely from G. I. Taylor's[1] classic paper of 1934. In that paper, Taylor ascribes the resistance to flow or hardness of a metal to the interaction between dislocations; as the metal is deformed, more and more dislocations are formed, so that work-hardening can be ascribed to the increase in this interaction as the strain is increased. At the time that Taylor's paper was written, no model existed to account for the formation of dislocations as a consequence of strain; a model for this purpose was proposed by Frank and Read[2] in 1950 and is now generally accepted, though up to now no direct experimental evidence for its validity has been obtained. The model assumes the presence in an annealed metal of a dislocation network such as that observed in silver bromide by Hedges and Mitchell[3], and shows that each element of the network can act under a low stress as a source of dislocation rings. It thus gives an unforced explanation both of the low yield-stress of annealed crystals and of the localization of slip on a few active slip planes.

---

* Substance of a lecture at the Royal Institution delivered on November 2.

The localization of slip on active slip planes makes it difficult to explain work-hardening if one assumes that it is here on the active slip planes that the dislocations are. Slip bands observed under the optical microscope are normally about a micron apart. One can scarcely imagine the material between active slip planes to be free of Frank–Read sources. In a material that has been strained, then, one has to ask why these sources have not generated dislocations. Their interaction with dislocations on the slip lines one micron away would be at least a hundred times too weak to stop them. To solve this dilemma, I suggested[4] that dislocations are formed in the surrounding material, too ; I pointed out that in the slip lines we may have to do not only with single dislocations but also with large piled-up groups and that the stress around these groups would be large enough to produce some flow in all parts of the cold-worked crystal.

While some secondary flow of this kind may occur, the observations of Wilsdorf, Van der Merwe and Kuhlmann-Wilsdorf[5] suggest that the solution of the difficulty is more simple ; using the electron-microscope and a silica replica, they observe fine slip lines about 200 A. apart, 50 A. high and 10 microns long filling the space between the 'coarse' or visible slip lines or bands. One may assume that these fine slip lines, too, are due to the production of dislocations by Frank–Read sources, and that the dislocations so formed are responsible for hardening the material between the slip bands. Although fine slip may account for as little as ten per cent of the total deformation, it is the dislocations produced by fine slip which must account for the resistance to flow of the weakest part of the material, namely, that between the coarse slip lines. It is the fine slip, therefore, which, according to these ideas, determines the stress-strain curve.

Following and extending the ideas of Wilsdorf and Kuhlmann-Wilsdorf, we may treat the hardening quantitatively as follows : let S and S' in Fig. 1 be two sources which are giving out dislocations at the same time. Let the intersections SX, $S'X'$ of their slip planes with the plane of the paper be at a distance d from one another. Then if the applied stress S is great enough to push a pair of dislocations such as PQ past each other, an arrangement such as that shown in Fig. 1 will result. When the stress is taken off, P and Q will form a doublet and stay together owing to their mutual attraction, as will also P' and Q' and so on. The arrangement is therefore stable. Work-hardening results as d decreases through the formation of more and more fine slip lines, the flow stress S being given according to the authors cited by

$$S = Gb/8\pi(1 - \mu)d$$

Here G is the shear modulus, b the Burgess vector and μ Poisson's ratio. Among the dislocations which result from fine slip we do not envisage anything in the nature of piled-up groups.

Coarse slip may be due to a kind of instability in the mechanism for the formation of fine slip. If one Frank–Read source produces an excess of dislocations which are unpaired with those from any other source, as in Fig. 1(*b*), a piled-up group will form, which could push its way past the dislocations on neighbouring active fine slip planes, so that more and more dislocations are produced from this particular source.

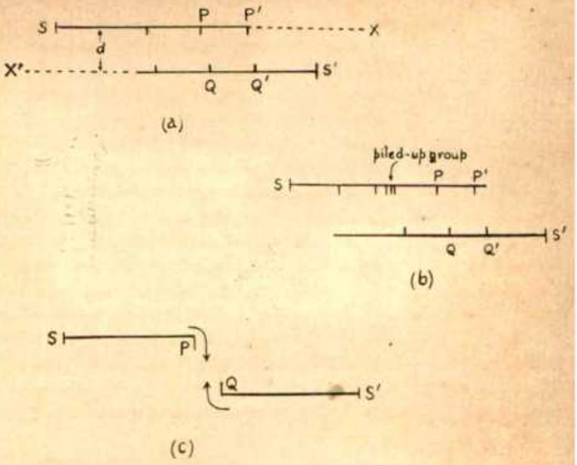

Fig. 1

(*a*) Arrangement of dislocations in fine slip
(*b*) Mechanism for the formation of coarse slip lines
(*c*) Disappearance of dislocations by climb or cross-slip during creep

We have no detailed model for the hardening within a coarse slip band ; perhaps the arrangement is similar to that of Fig. 1, but with a longer slip distance and more dislocations. But there are two reasons for believing also that piled-up groups are formed. One is that polycrystalline metals do eventually fracture in a tensile test ; as Stroh[6] and I[7] have pointed out, the most natural stress-raiser at which fracture can begin is the piled-up group at the end of a slip line. The other is the broad slip lines observed in fatigue in polycrystalline copper by Wadsworth[8]. An example (at present unpublished) is shown in Fig. 2. The subsidiary slip which occurs here and there at about 45° to the main line looks as though it were due to local stresses around piled up groups.

Whatever the mechanism of hardening in the coarse slip line, our point remains that if there is no fine slip there should be very little hardening. Thi prediction seems in fact to be in agreement with observations of the deformation of crystals of alpha brass. The observations of Wilsdorf[5] for this meta show that there is no fine slip ; a model due t

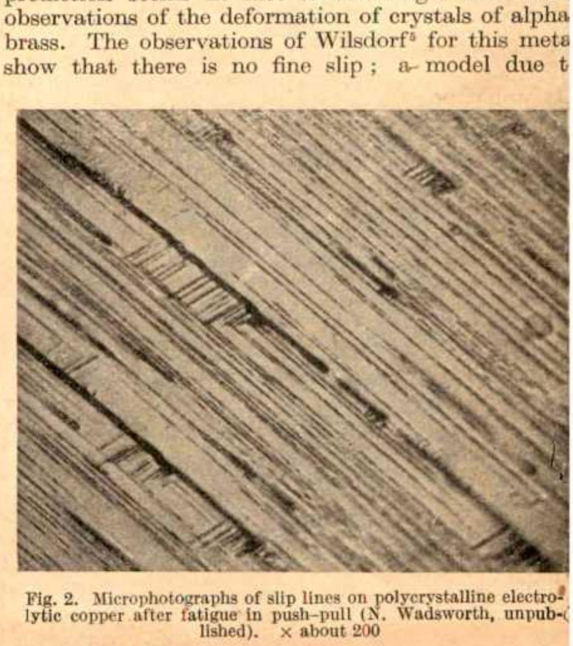

Fig. 2. Microphotographs of slip lines on polycrystalline electrolytic copper after fatigue in push–pull (N. Wadsworth, unpublished). × about 200

Fisher[9] explains this, showing that in solid solutions a source which has once started to generate dislocations has a tendency to continue. But the interesting point about alpha-brass is that, so long as slip is confined to one set of planes, there is very little hardening, coarse slip does not, it seems, harden the intervening material[10].

As shown particularly by Andrade's group[11] and by the work of the Gottingen school[12], work-hardening proceeds more rapidly in single crystals when slip occurs on more than one plane, though the observations relate to the coarse slip only This we suppose to be due to the mutual locking which, according to the ideas of Cottrell[13] and Lomer[14], can occur when two dislocations in different glide planes interact. This will shorten the slip distance, so that more dislocations will be produced by a given deformation.

Cold-worked materials, as shown, for example, by the experiments of Hirsch and his colleagues[15], show a cellular or polygonized formation, the size of cells being about the same as the distance between the (coarse) slip lines. This seems to us to follow naturally from the model · the material in the cells will be full of pairs of dislocations due to fine slip, but the coarse slip bands, if the amount of slip on a band varies along its length, is bound to lead to a bending of the material between them This bending gives rise to an excess of dislocations of one sign, and it is these that polygonize and form the walls of the cells.

We turn now to a discussion of creep, and with this model we may ask what is the rate-determining process, in any event in creep under constant stress when the rate of strain has settled down to a constant value. In experiments on pure metals such as those of Wood[16] and of McLean[17], what one observes is the breaking up of the grains into sub-grains. This we believe to be a consequence in polycrystalline material of the bending of the individual grains which must occur[18] during strain and the subsequent polygonization. It is not in our view likely to be the rate-determining process, this will be the plastic deformation of the sub-grains. Further, since the creep under discussion is at a steady rate, and no work-hardening is taking place, the process must be envisaged as shown in Fig 1 (c) Two sources give out dislocations which move into one another's neighbourhood and then annihilate each other Annihilation can occur by 'climb' in the case of edge dislocations, or by 'cross slip'[19] in the case of screws. It would be of great interest to know whether the dislocations in cold-worked metals are mainly edges or screws. It has frequently been suggested that the dislocation rings given out by Frank–Read sources should be very oblong and mainly of screw type, because of the high stress believed necessary to move a screw dislocation containing jogs. To find out whether this is so, one needs to examine the lengths of the fine slip lines on the top and side surfaces of a strained single crystal, this is a key experiment that ought to be done.

It may be that the annihilation by climb of dislocations such as P and Q can be the rate-determining process in creep. If so, and if the mean distance between jogs along these lines is less than the distance PQ, the activation energy for creep ought to be the same as for self-diffusion and ought not to depend on stress. A recent report by Dorn[20] suggests that this may be so. On the other hand, there is much evidence that, particularly in technical creep-resisting materials, it is slip rather than climb, or self-diffusion, which determines the rate of strain. Materials in solution above the limit of solubility, which slowly diffuse to the dislocations and form atmospheres there in the way proposed by Cottrell[21], are obviously able to impede slip, but scarcely to impede climb. One wonders whether the slow motion of dislocations from points such as S to P is perhaps not the rate-determining process in such metals, their disappearance then always taking place quickly enough to prevent the accumulations of dislocations that we call work-hardening.

If so, it is possible to propose a mechanism for a temperature-dependent movement of dislocations which seems to account for many of the observed facts of creep in pure metals As mentioned above, the screw elements of dislocation rings are the ones which will find it hard to move, because when they contain jogs they leave behind them a row of vacancies. A screw dislocation can only move forward with the help of temperature if each vacancy produced moves away as soon as it is formed; if it remains *in situ* it will pull the dislocation back. As I have shown[22] in a paper contributed to the recent conference on creep at the National Physical Laboratory, the rate of movement of a screw dislocation under a stress S and at a temperature T might be expressed by a formula of the type:

$$\nu l \exp \{ - (W - b^2 lS)/kT \}$$

ν is here an atomic vibrational frequency, l the distance between jogs, and W the energy for self-diffusion. This is the type of formula that many authors (for example, Feltham[23]) use in expressing creep results, with an activation energy that drops sharply with stress The divergence between these results and those of Dorn, who uses a formula of the type

$$\text{const.} \exp \{ - (W/kT) - \beta S \}$$

represents a point of great interest for the theory of creep, though it is difficult to be sure in experiments at different temperatures that l will be the same.

Another point which has been emphasized by Seeger[24] is that the energy of a jog is much greater in copper than aluminium, so that climb will be slower than in the former metal. The rapid recovery of cold-worked aluminium may perhaps be associated with this fact.

OBITUARIES

Prof. P J Heawood, O B E

Percy John Heawood died in Durham on January 24 in his ninety-fourth year. Educated at Ipswich and at Exeter College, Oxford, he taught mathematics at Durham, first as lecturer and then as professor, for fifty-two years, from 1887 until 1939. His early promise as a mathematician was to some extent thwarted by the width of other interests—religious, intellectual and administrative—which he pursued throughout his academic career at Durham, but he published a paper in his ninetieth year on the four-colour problem, more than sixty years after his first published work on that subject He held in turn almost every administrative post in Durham, culminating with a two-year term as vice-chancellor in 1926–28 His loyalties were strong, and the strongest was for Durham, where his great memorial will be the Castle, once more standing firm and safe above the River Wear. When it began to slide down the cliff, the University spent all its available resources and despaired of finding the vastly greater sum needed Almost alone, Heawood would not despair, and as secretary of the Castle Preservation Committee toiled year after year until the newly founded Pilgrim Trust came to the rescue with a very large grant.

Heawood was almost extravagantly unlike other men, in appearance, mannerisms and habits of mind. An immense moustache, an extremely loud voice, and a long cape of strange pattern and manifest antiquity made him conspicuous to eye and ear. He set his watch once a year, on Christmas Day · "No, it's not two hours fast, it's ten hours slow". All his life was organized on equally logical but fantastic lines Long before he was distinguished by longevity, legends had clustered thick about him. He did not cultivate his reputation as a character. He just went his way and did not care whether people laughed. But this comic side was by no means the whole man Together with some prejudices and some limitation of sympathies, he was interested up to extreme old age in many sides of the contemporary world, he could be lively and humorous as a speaker, and was an excellent chairman at meetings, for which he had a singular passion He read Latin, Greek and Hebrew all his life with real appreciation. His transparent sincerity, piety and goodness of heart, and his extraordinary blend of naïveté and shrewdness, secured to him not merely the fascinated interest, but also the respect and indeed the affection, of his colleagues. Latterly he was indeed a Nestor in Durham. He had been teaching there for some years before the oldest member of the present Senate was born.

James Duff

Dr. C. H. Hampshire, C M.G.

Charles Herbert Hampshire, secretary of the British Pharmacopœia Commission during 1929–50, died in London on January 25 at the age of sixty-nine He was born at Ilkley, and in 1905 entered the School of the Pharmaceutical Society with a Jacob Bell scholarship and there showed great promise. He gained most of the prize medals of his year, qualified as a pharmacist and later joined the staff and took a London honours degree in chemistry. An early intention to follow a career in teaching was abandoned in 1914 when he was appointed chief pharmacist at University College Hospital, London, a post which he held until 1929. During this period he became a student in medicine, not with the intention of taking up medical practice but in order to fit himself for the expanding responsibilities of the pharmaceutical department of a teaching hospital. He obtained the Conjoint diploma in 1925 and the M.B., B S. of London in 1927.

These earlier phases of Dr Hampshire's career proved their value when, in 1929, he was appointed secretary of the British Pharmacopœia Commission, a body newly created by the General Medical Council on the advice of the Macmillan sub-committee of the Committee of Civil Research. He developed the permanent organization to serve the work of succeeding Commissions in the evolution of a modern pharmacopœia, and his twenty-one years of office saw the "British Pharmacopœia" achieve a standard which is respected throughout the world. He was responsible for a new edition in 1932 and, after the issue of six war-time "Addenda", he dealt with another edition in 1948. To this complicated work he brought unstinted energy and wide knowledge.

Early in his career Dr. Hampshire became interested in the development of an international pharmacopœia and in 1937 was appointed chairman of the Technical Committee of Pharmacopœial Experts set up by the League of Nations, after the War he was called upon to preside over the Expert Committee on the Unification of Pharmacopœias appointed by the World Health Organization. In 1951 he was able to present the first volume of the "Pharmacopœa Internationalis" to the assembly of the Fédération Internationale Pharmaceutique in Rome, and to the end of his life he continued his work on the preparation of further volumes.

He will be remembered chiefly for his major achievements as a pharmacopœial expert, but he gave long and devoted service to other aspects of pharmacy and medicine. He was editor of the *Quarterly Journal of Pharmacy and Pharmacology* from 1928 and continued in office when it became a monthly publication in 1949. He was chairman of the British Pharmaceutical Conference during 1932–34, and for many years a member of the board of examiners of the Pharmaceutical Society and of the Royal Institute of Chemistry, of which he was a Fellow. In 1949 he was made a Companion of the Order of St. Michael and St. George. By Dr. Hampshire's death international pharmacy has been deprived of one of its most distinguished figures, and British pharmacy has lost a dignified and devoted servant.

T C. Denston

Lord Charnwood

Lord Charnwood, who died on February 1 at the early age of fifty-three, and who made some notable contributions to the study of physiological optics, and particularly binocular vision, was the son of the first Baron Charnwood and Dorothea May Roby A product of Eton and Balliol, he later trained as a mechanical engineer, becoming the chief engineer of Bamford-Martin, the original makers of the Aston-Martin car. During the War he became interested in problems connected with the training of range-takers, using stereoscopic range finders. This gave him his first opportunity of carrying out experimental work on vision. Eventually he qualified as an ophthalmic optician, becoming a Fellow of the

British Optical Association, and afterwards an Honours Fellow of the Worshipful Company of Spectacle Makers

He practised in London and joined the staff of the London Refraction Hospital, where much of his research work was carried out. Lord Charnwood was the first recipient of the new higher diploma of the Worshipful Company of Spectacle Makers, and was awarded the Master's prize for his thesis on binocular vision He was awarded an honorary diploma in orthoptics by the British Optical Association in 1952, and the Research Medal of that body in 1954.

He was also a lay Fellow of the Royal Society of Medicine, a Fellow of the Physical Society, and of the Royal Microscopical Society. He was a Fellow of the American Academy of Optometry, and had lectured widely in the United States. His output during these eight years was outstanding, as the following will show

Lord Charnwood described his research as a "record of unrelated small attacks on a number of facets of the problem of how the brain contrives to drive the two eyes in double harness". His most important work was probably his "Essay on Binocular Vision", published in 1950, but his paper on 'Retinal Slip", read at the International Optical Congress in 1951, and reported in the *Transactions*, was of an equally high standard. Other work carried out by him was described in a number of contributions between 1947 and 1952. These included "Some Anomalies of Binocular Vision", a paper read at the London Refraction Hospital Congress, 1947, and "Notes on Prolonged Occlusion" (*Optician*, August 8, 1947), following Marlow's work on this subject This was afterwards extended to include the treatment value of occlusion in binocular imbalance, described in a paper, "The Diagnostic and Therapeutic Use of Monocular Occlusion" (*Brit J Physiol Optics*, January 1951), and a number of papers in *The Optician*, including one on the "Mathematical Analysis of Binocular Vision" (Jan. 30, 1948).

An interesting and unusual contribution was his "Influence of Alcohol on Fusion" (*Brit J Ophthalmology*, 1950), in which he demonstrated the reduction of the fusional reserves under the imbibition of alcohol, and suggested that some comparable intoxication might be the means whereby such illnesses as measles and whooping cough precipitate squints. He had a communication in *Nature* of August 26, 1950, on the "Effect of Posture on Involuntary Eye Movements".

Lord Charnwood's final contributions, "Stereopsis in the Presence of Diplopia" and "Fusion in Binocular Vision", a criticism of Asher's suppression theory, were both produced in 1954 and published in the *British Journal of Physiological Optics* a few months before he died

By his death, the optical profession has lost an outstanding figure, and he leaves behind him many friends

G H GILES

NEWS and VIEWS

Zoology at Bedford College, London : Prof. N. Millott

PROF NORMAN MILLOTT, who succeeds Prof H Munro Fox in the chair of zoology at Bedford College, University of London (see *Nature*, 174, 537, 1954), is a graduate of the University of Sheffield. His early work, on the morphology and physiology of the gastropod mollusc *Jorunna*, completed during the period of his first university appointment as demonstrator in the University of Manchester, was accepted for publication by the Royal Society and its excellence recognized by the award, in 1936, of the Rouse Ball Studentship at Trinity College, Cambridge. Under the influence of the Cambridge experimental school, Prof. Millott began his investigations of the form and properties of the visceral nervous system of the earthworm *Lumbricus* and of the nervous control of secretion, the results of which were published in a series of papers in the *Proceedings of the Royal Society*. During the War, Prof. Millott served as a signals officer in the Royal Air Force and on demobilization returned to Manchester, first as a lecturer and later as a reader in zoology. When in 1947 applications were invited for the chair of zoology in the newly founded University College of the West Indies, Prof Millott, now well known as a stimulating teacher and for the originality and high quality of his research work, was selected for the important task of organizing the Department of Zoology, and, in consultation with the University of London, of devising courses suitable for overseas students taking the B.Sc. degree of London. In this he has been conspicuously successful. During his eight years in the West Indies, Prof Millott has, moreover, not only maintained his contacts with British universities but also has spent much of his vacation time visiting and working in American universities and laboratories. His experience and qualities will ensure him a warm welcome from his future colleagues in Bedford College and from fellow zoologists throughout the University of London

James Clayton Prize for 1954 : Sir Christopher Hinton, F R S.

THE James Clayton Prize for 1954 of the Institution of Mechanical Engineers has been awarded to Sir Christopher Hinton for his pioneer work in applying the results of nuclear research to the production of fissile material and industrial power, communicated in part in a lecture delivered to the Institution of Mechanical Engineers during 1954 By the terms of the will of the late Mr James Clayton, not less than one-quarter of the annual income accruing from the James Clayton Trust Fund shall be awarded as a prize to a member, associate member, graduate or student of the Institution for a contribution during the year to modern mechanical engineering science by way of research, invention or experimental work, or by a treatise or paper on a modern mechanical engineering subject , or by originality in design , or by service to mechanical engineering. The sum of £1,620 was available for the 1954 award

Expenditure by the Department of Scientific and Industrial Research

REPLYING in the House of Commons to questions regarding grants to research associations, Mr J. R. Bevins, Parliamentary Secretary to the Ministry of Works, as representing the Lord President of the

Council, stated on January 28 that about £40,000 of the additional £91,000 allocated to research associations by the Department of Scientific and Industrial Research during the present financial year is for providing increased grants for a number of existing associations and initial grants to the Chalk, Lime and Allied Industries Research Association, the British Steel Castings Research Association and the Timber Development Research Council. The remainder is for capital grants to the Electrical Research Association and the Production Engineering Research Association. On February 1, Mr. Bevins added that in the financial year 1950–51 capital grants of £271,000 were made to research associations, in 1951–52, £53,000, in 1952–53, £17,000, in 1953–54, £2,000 It was expected to make no capital payments in the present financial year. Industries were asked to undertake to raise special contributions over and above their normal revenue contributions to the research associations, and the estimates of the total cost have to be submitted to the Department of Scientific and Industrial Research for approval He also referred to the special surveys of the resources, facilities and programmes of the leather, cast iron and ceramics research associations, which were carried out as an experiment in 1950–51, a survey of the work of the British Scientific Instrument Research Association has just been started.

The affairs of the Department of Scientific and Industrial Research were again the subject of questions in the House of Commons on February 8 Mr. Bevins stated then that only about five per cent of the Department's work is directly undertaken for defence, and that is normally paid for by the Defence Department. In a written answer, he said that the staff establishment at the Fuel Research Station in 1953–54 was 292 and the expenditure £268,535, compared with 311 and £295,550, respectively, in 1954–55. Asked for an estimate of the expenditure of the Department in terms of 1946 values, he gave the following figures for gross expenditure based on the price index for all consumer goods and services calculated by the Central Statistical Office annually.

1944–45	£1,491,000	1949–50	£3,662,000
1945–46	1,685,000	1950–51	4,019,000
1946–47	2,208,000	1951–52	4,035,000
1947–48	2,825,000	1952–53	4,085,000
1948–49	3,198,000	1953–54	4,076,000

Referring to the Geological Survey, he said that about 60 per cent of England and Wales, 90 per cent of Scotland and all Northern Ireland have been surveyed in detail, but he could not state when the survey would be completed

Earth Tremors in Quetta

A SWARM of strong earth tremors, about forty in number, starting about February 13 and continuing on February 20, has affected the district around Quetta. Damage to the water supply system and a temporary breakdown of electricity supplies and telephone communications are reported, and there has been damage to property, with some fatal casualties There is some apprehension in the district, since many remember the earthquakes of May 1935 when some twenty-five thousand people were killed

Journal of the West African Science Association

BEFORE the Second World War, some excellent scientific work was done in the British West African territories, but the number of research workers was small, they were mostly in government service with much of their time taken up in routine work, and there was little difficulty in finding an outlet for the publication of results in the existing journals Since the War, the establishment of the new University Colleges in the Gold Coast and in Nigeria, and the development and expansion of the independent research institutes dealing with trypanosomiasis, virus diseases, cocoa, oil palms, fisheries, etc, has greatly increased the volume of original work, at a time when existing journals are crowded and publication of new work is often long delayed A new publication, the *Journal of the West African Science Association* (1, Part 1, October 1954. Pp. 72+1 plate. London Charles Knight and Co, Ltd. 21*s* per vol (2 parts)), is intended to serve as an outlet for work dealing with West Africa as a whole It is well produced (printed in England), and the papers in the first number reach the standard required by most established journals They cover a wide field—the geography of Nigeria's coastline, the geology of the Achimota College cricket field, land utilization, check lists of molluscs and seaweeds, new records of flowering plants, and a review of recent work on soil fertility. It is stated that one reason for producing this new journal is that "it is convenient for research workers to have their papers on this area readily available within one journal". This can only be true to a limited extent. If reviews of interest to scientific workers generally are to form the journal's main contents that will be true, and the paper on soil fertility (by P. H. Nye) fulfils this object, but the other papers are more specialized, and it is difficult to imagine that many members of the West African Science Association will read more than one or two with interest or understanding Research as a whole is bound to be specialized, however much this may be deprecated, and by trying to cover too wide a field this journal might defeat its object. However, West Africa is developing rapidly and there is certainly room for this and more journals like it, it is probable that as it grows it will be necessary to divide it into various sections dealing with different subjects, and perhaps later on it will become the parent of a distinguished family o scientific publications.

Bulletin of the Research Council of Israel

THE Israel Research Council was set up some year ago to organize and stimulate research in all branche of science and technology and to co-ordinate th work of the many scientific institutes in the country The *Bulletin of the Research Council of Israel* is published quarterly (Jerusalem: Israel Scientific Press Annual subscription, I£4.000, 5.50 dollars) and contains original papers as well as preliminary communications in the form of "Letters to the Editor' Papers are submitted in English or French, an summaries of them are collected together at the bac of each issue, where they can be easily consulted Volume 4, No 1 (June 1954) contains nineteen papers of which several are on biochemical or chemical topics Three of these papers are contributions from America laboratories and the rest are from workers in th Hebrew University, the Israel Institute of Technology, the Weizmann Institute or other laboratorie in Israel. L. Picard, of the Israel Geological Institute has written an interesting article on the structura pattern of Palestine, and there are two papers technological interest as well as others on botanic and zoological subjects. The standard of the articles appears to be high, and the journal itself is well produced. A whole section of this issue of the *Bulletin* reports the proceedings of the Israel Chemical Society by giving adequate abstracts of the communications in inorganic, organic and physical chemistry which were delivered. There is also a biographical sketch of Prof. Andor Fodor, on the occasion of his seventieth birthday, to commemorate his long association with the Hebrew University and with the development of scientific work in Israel

Research Essay Competition

THE Scientific Advisory Board of *Research* has decided for the third successive year to organize a "Science in Industry" essay competition The purpose of the competition is to encourage scientists to take greater interest in the problem of presenting the results of scientific research work to people less highly qualified than themselves. It will be in two parts The first part aims at directing attention to the problem of the scientist in communicating with the industrial policy-maker. Often, the board of directors of an industrial firm contains no member with scientific or technical training Scientists must learn how to put forward the case for the development or investigation of some new scientific process or project in terms which a technically unqualified board can appreciate. Competitors are required to make their case in an essay of about three thousand words in length Prizes amounting to £200 are to be awarded for this part of the competition In addition, the author of the best essay will receive a special new award to be known as the Waverley Gold Medal The second part of the competition requires the scientist to discuss one of four set subjects in a manner suitable for publication in a general newspaper The prizes for this part of the competition, amounting to £150, are to be awarded by the *Sunday Times* Further information can be obtained from the offices of *Research*, 88 Kingsway, London, W C 2

Endeavour

MAINTAINING its standard of excellence, the latest number of the journal *Endeavour* (issued by Imperial Chemical Industries, Ltd) contains some interesting and important articles Sir Macfarlane Burnet, for example, examines the riddle of the influenza virus and shows that growing knowledge of the influenza virus leads to the conclusion that, while this has distinct antigenic, enzymic and genetic properties, it is at the same time chemically indistinguishable from fragments of the cytoplasm of the cells in which it is a parasite, this conclusion is of fundamental importance, not only in devising new methods of attacking what can be a very deadly disease but also for understanding the structure and function of the vertebrate cell Dr Charles Singer describes some of Robert Hooke's brilliant contributions to biology, and Dr. E N. Willmer discusses the sensation which human beings call "white". "Storms in the Ionosphere" is the subject of an article by Sir Edward Appleton, while the place of James Muspratt and his family in the British heavy chemical industry is considered by Dr. D. W. F. Hardie. Dr A. Frey-Wyssling describes some information collected by the use of the electron microscope in plant cytology, and Prof. Munro Fox surveys the principal types of coloration in animals and is supported by some colour photographs which have been faultlessly reproduced.

Research in the Social Sciences

THE National Institute of Economic and Social Research has again published its Register of Research in the Social Sciences. This follows the plan of the ten previous numbers, although two substantial changes have been made. The first has been to cut down drastically the amount of repetition of information that has already been recorded in previous issues This will mean that, for fuller information about research items that have already been reported in a previous Register, the user must consult that issue, the reference back is given in each case New information about work in progress or work newly completed has been included The second change has been to revise the section of the classification dealing with economics The new classification replaces one that had become progressively less suitable as a means of classifying contemporary research in Great Britain The year 1953–54 shows a substantial increase in the number of new research projects that have been reported, the total having risen from 201 in 1952–53 to 291 in the current Register This increase is largely the consequence of the impact of the Conditional Aid economic and social research programmes in Great Britain. These new programmes, supported by funds derived from the United States, have provided finance for about sixty of the new inquiries reported here The programmes are designed to encourage and expand research of all kinds into factors affecting the efficiency of the national economy Thus nearly half the economic research recorded here into business structure and functioning, monopoly and competition, productivity and efficiency, is supported by Conditional Aid, it also provides funds for a quarter of the work in industrial relations and management.

City of Manchester Public Libraries: Report for the Year 1953–54

THE hundred and second report of the City of Manchester Public Libraries Committee (pp. 16+28+35+4 plates, Manchester Public Libraries, 1954) covers the year ended March 31, 1954, but records the death of the City Librarian, Mr. Charles Nowell, on August 9, 1954, while the report was in preparation Although the reference libraries continued to attract more readers—627,847 in place of 602,528 the previous year, with an increase in the issue of books from 719,361 to 769,917—fewer books were borrowed from the lending libraries, and the total number of volumes issued to readers decreased from 6,241,375 to 5,929,621. The addition of 102,115 volumes brought the total stock to 1,095,333, of which 663,074 are available for loan A census of users of the central library during 9 a m –9 p m. was made on March 30, 1954, and the results are detailed in a summary accompanying, like the usual statistical summary, the annual report. Of 4,156 entering the library, 3,080 completed the census form as requested of 689 users of the reference library, 237 lived in Manchester and 452 elsewhere, in the commercial library there were 192 Manchester residents to 305 outside the City boundary, in the technical library the proportion was 123 to 170, and in the central lending library, as might be expected, there were 816 Manchester residents to 314 non-residents. Of those visiting the periodicals room, 143 were Manchester residents and 120 from outside the City boundary, for the Henry Watson music library the corresponding figures were seventy-two and eighty-five, respectively, while eight readers visiting the special collections were non-residents of Manchester and three residents. Following the publication of the Manchester Joint Research Council's survey, "Science and Industry", the 225 firms participating in the survey were circularized with a brief statement of the services offered by the technical library, which now holds 86,572 volumes, and a selection of the latest publications A large proportion of the inquiries received were connected with technical research or development The number of readers using the library increased by 4,812 to 150,388, and the number of periodicals consulted increased, although the number of books used decreased slightly Stress is laid on the importance of co-operation in this field and on the cost of scientific and technical books, which during the year averaged 40*s* 8*d* per volume.

Nitrogen Metabolism of Groundnut Plants

L. FOWDEN (*Ann. Bot.*, 18, 72, 417, 1954), in an investigation of the nitrogen metabolism of *Arachis hypogaea*, has considered in some detail the role of γ-methyleneglutamine and γ-methyleneglutamic acid —two new compounds which are apparently not widely distributed in plants, as are, for example, asparagine and glutamine. The evidence that γ-methyleneglutamine was not present in ungerminated groundnut seeds and that γ-methyleneglutamic acid could not be detected in an acid hydrolysate of arachin, the principal reserve protein of groundnut seeds, suggested the possibility that important differences may be encountered between the roles of the new amide in groundnut plants and those of asparagine and glutamine in other species. The changes in various nitrogenous fractions during the growth of groundnut seedlings in the dark were compared with those occurring in seedlings grown in the light. The distribution of amides and acidic amino-acids in the various organs of young and mature plants has also been studied quantitatively, and observations have been made upon the amino-acids present in developing fruits. The author discusses the possible pathways of synthesis and the functions of these two substances in the groundnut plant.

Rayleigh Waves in a Medium with Two Surface Layers

THE problem of the propagation of waves of Rayleigh type in a uniform semi-infinite elastic medium with two uniform surface layers has been solved by R. Stoneley, in a paper entitled "Rayleigh Waves in a Medium with Two Surface Layers" (*Mon Not Roy. Astro. Soc*, Geophys. Supp, 6, No. 9, 610, 1954). The waves are dispersive, and the wave velocity equation turns out to be a determinant of the tenth order Various tests on the equation proved it to be satisfactory for example, by making infinite the thickness of the surface sheet it is possible to derive the velocity equation for waves in an internal stratum, and by making the thickness of either sheet zero, the known equation for the velocity of Rayleigh waves in a medium with a single surface layer is obtained If the wave-length is very small, the determinant reduces to the product of three determinants, which, equated in turn to zero, are the velocity equations of very short Rayleigh waves at the free surface and of very short waves of Rayleigh type at the two interfaces. Dr. Stoneley intends to give the results of a numerical solution of th wave equation at a later date, as well as a discussio of the application of the results to the actual surfa waves of earthquakes.

"The Rationalist Annual"

AMONG the articles contributed to "The Rationali Annual" for 1955 (pp. 81. London C. A. Wat and Co, Ltd, 1954. Cloth, 5*s*., paper, 2*s* 6*d*) a the late Sir Arthur Keith's comparison of Darw and Locke as philosophers, "Darwin's Place amon Philosophers". Sir Arthur claimed that if Locke accepted as a philosopher, Darwin must be regarde as one too, and he added that Darwin was the on philosopher known to him who could help in th interpretation of the problems of nationality an war which vex our modern world. Mrs Margar Knight suggests that good and evil, and joy an pain, are reconciled, in the only sense in which the reconciliation is possible, on the æsthetic plane; bu her essay seems to touch the experience of th scientist, as such, less than those of Prof. Morr Ginsberg on "Durkheim's Theory of Religion" an Prof. J. B. S Haldane on "The Origin of Purpose' Prof. V. Gordon Childe writes briefly on "The Ston Age comes to Life", E. H Hutton on "Religion an the Physicists", Antony Flew on "The Third Maxim' an analysis of the reason J B S. Haldane once gav for not being a materialist, Bertram Joseph on "Th Renaissance Mind" and Ernest Gellner "On Bein Wrong".

Microwave and Radio-frequency Spectroscopy

THE Faraday Society will hold a General Dis cussion on "Microwave and Radio-frequency Spectro scopy" in the Department of Zoology, University o Cambridge, during April 4–6. The programme wil be in four parts, at each of which a general intro duction will be given by the person shown micro wave spectroscopy (Prof H. C Longuet-Higgins University of Cambridge), microwave absorptio (Dr T M Sugden, University of Cambridge) nuclear magnetic resonance (Prof. H. S Gutowsky University of Illinois), and quadrupole spectroscop (Prof B. P. Dailey, Columbia University) Twenty three papers will be read, and advance proofs will b circulated about the middle of March. Application for accommodation must be made by March 23 Further information can be obtained from the Secretary, Faraday Society, 6 Gray's Inn Square Gray's Inn, London, W.C 1

Summer School of Welding

THE fifth Summer School of Welding organized by the British Welding Research Association will be held at Ashorne Hill, near Leamington Spa, Warwickshire, during June 27–July 2 The School will take for its basic theme "Welding Developments in British Industry", and has been devised to cover various aspects in logical sequence during the course As in previous years, lectures of general interest will be given in the morning, and lectures of more specialized interest in the afternoon To meet particular requirements, the course will be divided into the following groups *A*, pressure vessels, *B*, transport, *C*, shipbuilding, *D*, specialized welding techniques. It is possible that an additional group on "Inspection and Testing" will also be included Further information can be obtained from the Organizing Secretary, Summer School of Welding, B W.R A, 29 Park Crescent, London, W 1

The Night Sky in March

Full moon occurs on March 8d. 15h 41m, U.T., and new moon on March 24d. 03h 42m. The following conjunctions with the moon take place March 4d. 10h, Jupiter 2° N, March 13d. 22h., Saturn 6° N, March 21d 02h, Venus 4° S, March 22d 11h, Mercury 7° S, March 27d 11h, Mars 3° S, March 31d 16h, Jupiter 2° N. Mercury rises a little before 6h up to the middle of the month, and about 5h 30m at the end of the month—only a quarter of an hour before sunrise—and is unfavourably placed for observation during the whole of March Venus rises about 5h up to the middle of the month, and an hour before sunrise on March 31. It will be conspicuous in the eastern sky and will become more easily observed in the northern hemisphere owing to its increasing northerly declination, the visible portion of its illuminated disk increases from 0·651 to 0·753, and its stellar magnitude varies from −3·7 to −3·5 between March 1 and 31. Mars rises at 22h. 30m during the month, its eastward movement in Aries brings it close to δ Arietis about March 26, and during the month its stellar magnitude varies from 1·4 to 1·7, largely owing to its distance from the earth increasing from 176 to 197 million miles Jupiter, visible throughout the night and early morning hours, sets at 5h, 4h and 3h. on March 1, 15 and 31, respectively, its decrease in brightness from magnitude −2 to −1·8 is due to its distance from the earth increasing from 424 to 464 million miles during the month. Saturn rises at 0h 10m, 23h. 10m and 22h. 05m on March 1, 15 and 31, respectively, and lies rather low in Libra, stellar magnitude 0·6–0·5, the small increase in brightness resulting from its distance from the earth decreasing from 886 to 848 million miles Occultations of stars brighter than magnitude 6 are as follows, observations being made at Greenwich March 1d 22h 02·6m, 99 Tau (*D*), March 2d 23h 59·7m, 1 Gem (*D*), March 10d 21h. 33·5m, 370*B*, Vir (*R*), March 28d 19h 09·6m, 284*B*, Tau (*D*), March 28d. 21h 53·4m, τ Tau (*D*), March 31d 22h 49·7m, *g* Gem (*D*), where *D* and *R* refer to disappearance and reappearance, respectively. Vernal equinox occurs on March 21d 10h

Announcements

Dr H G Taylor, director of research of the British Welding Research Association since 1947, has been elected president of the Society of Engineers.

Dr Gerhard Herzberg, director of the Division of Physics of the National Research Council of Canada, has been elected an Honorary Fellow of the Indian Academy of Sciences "in recognition of his scientific eminence and of his outstanding contributions to knowledge"

The second Marjory Stephenson Memorial Lecture arranged by the Society for General Microbiology will be given by Prof C B Van Niel, of the Hopkins Marine Biological Station, Pacific Grove, California, at the Royal Institution, Albemarle Street, London, on April 18, at 6 p m He will speak on "Natural Selection in the Microbial World" The Lecture is open to the public.

The U S Administration has asked the National Academy of Sciences to appoint a committee to advise on the formulation of Federal Government policy dealing with the relations between questions of loyalty and the awarding of grants and contracts in support of unclassified scientific research

Dr. F W G White, C B.E, chief executive officer of the Commonwealth Scientific and Industrial Research Organization, Australia, has been invited by the Government of Egypt to advise it on the organization of scientific research in Egypt Dr. White will visit Egypt under the ægis of the Unesco Technical Assistance Programme for Egypt

Since the Princess Alice appeal for a million pounds for the University College of the West Indies was made on January 15, more than £400,000 has been offered in the form of donations and covenants (see also *Nature* of February 19, p. 328) The money is to be used for the establishment and endowment of teaching and research scholarships, bursaries, etc., a chapel and for general purposes.

A conference to commemorate the jubilee of the announcement by Albert Einstein in 1905 of the theory of relativity will be held this summer at Berne under the presidency of Prof. W. Pauli (Zurich). Prof. A Mercier (Institute of Theoretical Physics, University of Berne) will act as secretary for the conference Several authorities on cosmology, unified field theories, etc, have been invited to give addresses or take part in the scientific discussions

The Universities Federation for Animal Welfare will hold its Easter congress in St Patrick's Hall, University of Reading, during April 1–4. The fee for the congress, which includes full board and all expeditions, is 3 guineas (students 30*s*) Applications should be addressed to Miss M. P. Williams, UFAW, 7*a* Lamb's Conduit Passage, London, W.C 1, from whom further information can be obtained.

The Ministry of Agriculture and Fisheries and the Department of Agriculture for Scotland propose to award, for the academic year beginning on October 1, a limited number of postgraduate scholarships in agricultural economics, husbandry, statistics and agricultural and dairy engineering The closing date for applications is March 31 Further information can be obtained from the Secretary, Ministry of Agriculture and Fisheries (Research Branch), 1–4 Cambridge Terrace, Regent's Park, London, N W.1, or the Secretary, Department of Agriculture for Scotland, St. Andrew's House, Edinburgh 1.

A Sub-Section of the University and Research Section of the Library Association has been formed, the object of which is to foster the formation, growth and usefulness of libraries in colleges of technology and further education The committee consists of the following *Chairman*, L L. Ardern (Manchester College of Technology), *Vice-Chairman*, E G Baxter (Coventry Technical College), *Honorary Secretary*, G. H. Wright (Westminster Technical College), *Honorary Treasurer*, E R. Yescombe (Northern Polytechnic, London), *Members*, F. C Adey (Leicester Colleges of Art and Technology), O M. V. Argles (Hatfield Technical College), J. Fry (Cardiff Technical College) and E. R McColvin (Regent Street Polytechnic, London) Further information can be obtained from the honorary secretary, Gordon H. Wright, Greenway Court, Hollingbourne, Kent

A memorial service for the late Sir Edward Mellanby will be held at the church of St Martin-in-the-Fields, London, at 11 30 a m on March 17

THE NUFFIELD FOUNDATION

ANNUAL REPORT

THE ninth report of the Nuffield Foundation* covers the year ended March 31, 1954, when the Foundation's second five-year programme terminated, in which allocations totalling £594,302 brought the total of grants during the quinquennium to more than £3 million, and that since the Foundation was established in 1943 to more than £5 million Grants in the United Kingdom during the year included £18,938 from the Foundation's uncommitted resources, or 'free fund', £104,450 for biological studies and £120,445 for sociological studies. £189,428 was allocated for research in the Commonwealth overseas, £46,400 for research into practical problems, £51,080 for the care of old people, £46,178 for miscellaneous projects and £27,226 for the continuation of its past programme, while a further £10,000 was allocated to the Oliver Bird Fund

Reviewing first, however, the past quinquennium as a whole, the report notes that of £3,031,526 allocated in 1949–54, £441,897 was for biological and £376,188 for other scientific studies and £416,555 for social research in the United Kingdom £396,080 was for the care of old people and £146,070 for research on rheumatism, while the programme of training and travelling fellowships and similar awards received £515,056 During the quinquennium, while continuing its provision of scholarships designed to encourage travel for study within the Commonwealth, the Foundation has thought it opportune to extend help for research to institutions and people in overseas parts of the Commonwealth, where private-adventure money is more keenly needed, sought and valued. The latest allocation has been one of £250,000 for certain university colleges in the Colonial territories, and the Foundation hopes that on an expanding scale it may devote its attention to overseas parts of the Commonwealth, where growth is still young and vigorous and experiment is necessarily the order of the day.

Another innovation during the quinquennium has been the decision, in the light of an investigation into hospital functions and design, to establish for ten years a division for architectural studies as part of the Foundation's headquarters organization. The immediate programme of the new division includes the study of children's hospitals, research laboratories and farm buildings.

During the coming five years, the Foundation hopes to make its major contribution to the support of research in the United Kingdom in science, medicine and technology. In science its present preference and programme for biology will continue but on a reduced scale, and within the natural sciences the Foundation will be watchful for opportunities of encouraging those workers capable of devising the new concepts tools or techniques from which unpredictable, but invaluable, advances may ensue In medicine, the Foundation intends to build up further two or three existing centres of research on the chronic rheumatic diseases and will maintain a special interest in investigations into the causes of those mental and physical defects which throw so heavy a burden on the family and the community. In technology, besides agriculture, architecture, food and domestic science, the application of science to industry and fundamental applied science, the Foundation is ready to retain an interest in the shortage of scientists and able persons generally, and particularly in the shortage of science teachers in schools.

In the social sciences, the Foundation will be concerned to encourage fundamental research as well as studies of major social developments effected by legislation or similar means, urban studies, further work on social mobility and the problem of local government. Besides encouraging the collection and collation of facts about old people, the Foundation will be ready to assist research in the employment of elderly workers and into the process of ageing. All the current fellowship schemes are being continued, but some will be replaced during the quinquennium by new and experimental schemes.

Both new grants from the Foundation's 'free fund' during the year are in the medical field £6,000 for accommodation for a gastro-enterological research centre at the Central Middlesex Hospital, and £2,500 to the Department of Surgery at the Postgraduate Medical School of London for the construction of a second and improved heart–lung machine. An additional £5,000 has been allocated to the Mathematical Laboratory, University of Cambridge, for the construction of an electronic calculating machine and a further £5,000 reserved for another year.

In the biological sciences, grants were made for twelve new projects and for ten additional or renewed projects. New grants include £12,000 over four years to the Department of Botany, The Queen's University, Belfast, for quaternary ecological studies, £10,000 over five years to the Botanical Society of the British Isles towards the preparation of a distribution atlas of British flowering plants, and £10,000 to the Cavendish Laboratory, University of Cambridge, for the purchase of an electron microscope of high resolving power; £4,300 over two years for work on population genetics at the Department of Social and Preventive Medicine, The Queen's University, Belfast, £3,200 over four years to the Department of Zoology, University of Edinburgh, for special equipment and technical assistance in work on developmental energetics, and £2,500 a year for three years for additional research assistance and materials for the work on vitamin A and the metabolism of sterols in the Department of Biochemistry, University of Liverpool. An additional £1,500 has been contributed to the biophysical work at the Wheatstone Physics Laboratory, King's College, University of London, £2,400 over three years for research at University College, London, on electrical changes in central nervous tissues, a further £7,950 over three years for the investigation at University College, London, into proliferation and morphogenesis in the adult, and a renewed tapering contribution of £2,400 a year for the first three years and £1,200 a year for the last two years for the work on cell biology at the Strangeways Research Laboratory, Cambridge. Further sums of £2,000 a year for equipment and materials and £650 a year for two years for an additional assistant physicist have been offered to the Department of Physics Applied to Medicine, Middlesex Hospital Medical School, for the study of the mineral activity of adrenal steroids.

---

* Nuffield Foundation Report for the year ended 31 March 1954 Pp 141. (London Nuffield Foundation, 1954)

Six of the twelve grants made for sociological studies during the year were new. One of those, of £4,500 over two years, is for an inquiry being conducted by the Institute of Community Studies, London, into various aspects of ageing in relation to family life and care within the family. Another, of £3,000 a year for three years, is to the Institute of Education, University of London, for an inquiry into the social characteristics of the teaching profession, including the changing geographical and social sources of recruitment to the teaching profession in England and Wales, and the relation of its origins to characteristic features of its way of life. A grant of £3,000 over two years has also been made to the Royal Institute of Public Administration for an inquiry into alternative sources of local revenue the results of which should greatly assist in deciding upon the character of the local government reforms required in Britain. Two grants have been made to the Institute of Social Anthropology, University of Oxford: one of £1,000 for a study in Cyprus and the other of £1,500 over three and a half years for a structural analysis of the State of Israel, with special regard to its position as a Middle Eastern nation.

Renewed or additional grants in this field include £3,600 over three years for research of the 'operational' type at the Department of Social Science, University of Liverpool, for the continuation of studies on community and race-relations. A grant of £10,000, tapering from £3,600 in the first year to £400 in the fifth, has been offered to the Division of Research Techniques, London School of Economics and Political Science, for current field-research on methods of reducing the cost of random sampling, the variability between interviewers, the design of questionnaires and social classifications and their use in sampling inquiries. £8,000 goes to the Institute of Statistics, University of Oxford, for a third national survey of income and savings and a further £2,500 over two years to the Department of Psychology, University of Reading, for continuing its work on visual aids to learning. A renewed grant of £2,000 a year for two years to the Department of Town Planning, University College, London, will enable the main results so far reached in case-studies of three local planning authorities to be tested against comparable material from other authorities.

Of two new grants from the Oliver Bird Fund made during the year, one of £20,000 (since increased to £27,000) is to provide and furnish a new building for the Rheumatic Unit at the Northern General Hospital, Edinburgh, while since the end of the financial year covered by the report the Foundation has offered a further £70,000 over eight years to the Rheumatism Research Centre at the University of Manchester, £8,000 to the University of Sheffield for a research fellowship in the Sheffield Centre for the Investigation and Treatment of Rheumatic Diseases and £6,000 to the Oxford Regional Hospital Board for work on the pathogenesis of rheumatic diseases at the Rheumatic Diseases Research Centre, Stoke Mandeville Hospital.

Apart from the grants for new developments in university colleges in the Colonial territories already noted (and which for Ibadan and the West Indies have already led to agreed schemes), the Foundation allocated £19,821 during the year for expenditure, preferably on biological research, in Australia, New Zealand and South Africa, and £20,475 for four projects in other parts of the Commonwealth. The former includes £2,480 over two years to the University of Sydney for fundamental work in the Department of Organic Chemistry on the biogenesis of natural products, using radioactive tracers, £9,760 over three years for a programme of twin studies at the Walter and Eliza Hall Institute of Medical Research, Melbourne, and £750 a year for three years to the University of the Witwatersrand for research on cardiac surgery in general and mitral disease in particular. Up to £2,000 has been offered to the Aden Protectorate for the advancement of a modern health service, and £1,600 over three years to the University College of the West Indies for an inquiry into the Collembola of Jamaican soils.

Four new grants for research into practical problems, totalling £45,200, and which involve bringing together people from two or more disciplines, were made during the year. A grant of up to £6,500 a year for three years to the Social Rehabilitation Unit at the Belmont Hospital, Sutton, is for an intensive study of the social and cultural background of a series of cases of psychopathy treated in the Unit. £15,000 has been allocated over two years for an independent study of the impact of television on children and young people, and the Foundation has offered £700 for equipment and £1,400 a year for five years to University College, London, for a study of skill in heavy manual tasks by the Departments of Physiology and Psychology.

The miscellaneous projects to which the Foundation allocated £46,178 during the year include grants of £1,000 towards the cost of the Third Congress of the International Association of Gerontology, £2,000 for an industrial accidents survey by the Central Middlesex Hospital and £15,000 over five years to establish a day-centre for the permanently disabled under the supervision of Dr F. S. Cooksey, of King's College Hospital. New grants for the care of old people include £3,000 a year for three years to the University of Bristol for field-experiments on the employment of elderly workers, £1,500 a year for five years to the Geriatric Unit, Sunderland General Hospital, for a study of physiological and pathological changes in the aged and ageing and £1,750 a year over three years to Cowley Road Hospital, Oxford, for an investigation in the geriatric unit of the mental deterioration of the elderly.

The Royal Society and Nuffield Foundation Commonwealth bursaries scheme established in 1953–54 is designed to complement the Foundation's other awards, more especially by encouraging able young scientists from Great Britain and overseas to work with leaders of research in other overseas parts of the Commonwealth. The scheme is to run for an experimental period of five years, during which the Foundation will contribute £5,000 a year with an initial contribution of £2,500 from the Royal Society. The medical fellowships are being continued on a reduced scale and the dental fellowships and scholarships, biological and sociological scholarships and bursaries are also being continued. The scheme of travelling fellowships for home Civil servants has been renewed for a second five years, but the travelling scholarships and bursaries for United Kingdom farmers will terminate in April 1956.

Grants in continuation of the past programme include £1,000 a year for three years for the investigation of changes which occur at birth in the circulation and breathing of lambs, £13,200 to the Department of Physics, Birkbeck College, University of London, for two research fellowships for three years for work on protein and virus structure, and £15,000 over five years to the Nuffield Research Group in the Department of Metallurgy at the Imperial College of Science and Technology, University of London, to tide the group over the time until full support is forthcoming from industry and the College for its work on the theory and practice of the extraction of metals from ore.

THE MINING INDUSTRY IN BRITAIN

INTERESTING human documents, though written primarily as the technical record of the work of the Mines Inspectorate in England, are a series of separate reports of the divisional inspectors of five divisions* Though ostensibly all written with the same objective, they have a refreshing variety, and are indications of the widely differing characters of the separate coalfields, which have required from a centrally controlled authority differences of approach appropriate to local conditions and practices

Naturally one's first search among these pages must be for the signs of improvement in the statistics of the killed and injured each year that must inevitably, one would think, take place as the result of the considerable attention that is given to the problem of safety In some divisions one finds an encouraging record of betterment, in others there are to be found an almost discouraging fluctuation of figures from one year to another that must have some deep-seated causes. On reading the separate reports, it very soon becomes apparent that the character of the pits varies widely—thin seams and thick seams, high standards of mechanization, less-developed ones, and wide differences in the character of the mining problems Perhaps the common problem is the stubbornness of human nature, shown in the repeated instances of accidents due to individual carelessness that has resulted in neglect of regulations framed for their prevention The major sources of fatal accidents are falls of roof and haulage breakdowns, particularly runaways

Interesting to the layman in these reports are the many references to the development of new methods and appliances culled from a wide field of experiment carried out both in and outside the industry of coal mining—thus the colorimetric testing of coal dust, the new developments of electric haulage, the ever-advancing character of the new devices for dealing with roof support, the vital problem of the miner, and the many new types of machine for coal cutting The introduction of machine mining has brought in its train new problems in dust suppression Following the experience which many mining engineers have had of the effect of water on the mining of coal, there is growing up a body of opinion which believes in this development, which must reduce the use of coal-cutters and shot firing and thus reduce the production of dust. In this application a long hole parallel to the coal-face is drilled, filled with explosive, and then high-pressure water admitted, the objective being to soften the coal

In spite of all the research and care taken in mine air analysis and other precautions, explosions of fire damp still occur—a pertinent reminder that in no branch of mining technology can it be said that all the problems have yet been solved.

On the surface and underground, good progress has been made in the improvement of the standards of illumination The removal of glare and shadows is an important feature of such advancement

Health and welfare, training and education occupy an essential place in the manifold activities of the mining industry Finally, it is interesting to note that the first electrically driven, horse-cleaning vacuum equipment operated by a certified flame-proof motor and switchgear was installed at the beginning of the year in the underground stables, 3,000 yards from the pit bottom at Hamstead Colliery. Should it be called an equus-cleaner? R J SARJANT

OVERSEAS FOOD CORPORATION

ANNUAL REPORT

THE Overseas Food Corporation is now concerned solely with investigations, first to ascertain experimentally crop and stock potentialities, with their cultural and husbandry requirements, second, to determine their practical limitations and economics, by applying the findings of the specialists to large-scale trials by farmers, and third, by incorporating in the large-scale trials variations in farming methods, to ascertain which form is likely to prove most productive and yield the greatest return as and when the area is developed The annual report and statement of accounts for the year ended March 31, 1954*, record steady progress under the first heading. The continued soil surveys, soil fertility studies and the fertilizer experiments are revealing the percentages of the various soil types to be found in the areas, their suitability to the range of crops under trial, their mechanical condition and their response to fertilizer treatment Considerable progress has been made in the study of rosette disease of groundnuts, and that on the mechanism of resistance of Mwitunde to rosette disease indicates reasonable hopes of selecting a strain combining high yield, low aphid reproduction, low percentage of infective aphids and perhaps some tolerance to the usually severe effect of the virus on yield Indications are that groundnuts may become an important crop in the rotation at Nachingwea and merit further trial at Urambo in the 1955–56 season

The second type of investigations was severely checked by the drought throughout Tanganyika during the 1952–53 crop season, but much information was obtained on methods of cultivation desirable under dry-farming conditions Variations in the third class included experiments with farms of 2,000 acres, 1,500 acres and 1,000 acres, fully mechanized and under European supervision, to determine the pattern of farming best suited to local conditions and the most economical size, while the possibilities of improving peasant farming on a group basis are being examined under the African Tenant Scheme

The Equatorie of the Planetis

EDITED BY

D. J PRICE

This book reproduces, translates and describes a fourteenth-century manuscript in the library of Peterhouse which Dr Price believes to be the work of Geoffrey Chaucer and in his hand Whether or not this ascription is accepted—Dr Price sets out the arguments for and against—the *Equatorie* is a valuable Middle English scientific text that is here presented in its proper historical setting. Mr R M Wilson provides a linguistic analysis and a glossary 52*s*. 6*d net*

The Ancient Inhabitants of Jebel Moya

R MUKHERJEE, C. R RAO & J. C TREVOR

This third monograph in the series of Occasional Publications of the Cambridge University Museum of Archaeology and Ethnology deals with the human remains (of the first millennium B C) from the late Sir Henry Wellcome's excavations at Jebel Moya in the Sudan between 1911 and 1914 Apart from the particular data obtained it is important as a guide to method in physical anthropology 40*s*. *net*

AN INTRODUCTION TO THE

BIOLOGY OF YEASTS

By M. INGRAM, M.A., Ph.D

This book describes what the yeasts are and what they do. It begins with an introductory chapter describing the general nature of yeasts, and then deals with the simpler and the more complex metabolic processes. A section is devoted to the process of growth and reproduction, and the book closes with an account of the behaviour of the yeast colony and its place in nature. Illustrated with line drawings and photomicrographs. 25/- net

MACMILLAN BOOKS

Science and its Background

H. D. ANTHONY, M.A.(Cantab.), B.Sc., Ph.D.(Lond.), F.R.A.S.

Here is the story of science, with the background of history in which that story is set. Although most of the chapters centre around individual men of science whose work is of value to-day, the historical background is not only that of isolated biography but the continuous history of human affairs Two chapters, on post-war developments and the pursuit of science for its own sake, have been added for this second edition. *Second Edition* 20*s.*

A Text-book of Electricity and Magnetism

G. R. NOAKES, M.A., F.Inst.P.

This is the new, Third Edition of a book which will meet the need of those taking Intermediate degree courses and the Advanced and Scholarship Examinations of the General Certificate of Education. All the usual topics required at this stage are dealt with, and where necessary calculus is used. Among the special topics discussed are the conduction of electricity through gases, atomic physics and modern views on ferro- and terrestrial magnetism. *Third Edition.* 14*s.*

Advanced Level Examples in Physics

R. V. JOHNS, M.A., B.Sc.

Lecturer in Physics and Mathematics, City of Liverpool College of Technology

W. F. WARE, B.Sc., A.Inst.P.

Senior Physics Master, Cathays High School for Boys, Cardiff

This book of numerical examples is designed to supplement the theoretical and laboratory work of students preparing for examinations in Physics at the Advanced level of the General Certificate of Education and for Intermediate Degree examinations. Some 1,000 examples have been arranged by topics and carefully graded in difficulty. Contents are arranged under the headings Mechanics and Properties of Matter, Heat, Light, Sound, and Magnetism and Electricity. 16*s.*

Semimicro Qualitative Analysis

A Course in Applied Chemical Equilibrium

EDWIN O. WIIG, Ph.D., WILLARD R. LINE, Ph.D., and JOHN F. FLAGG, Ph.D.

This revision of *Semimicro Qualitative Analysis,* while retaining the experimental procedures and much of the form of the earlier text, has been almost completely rewritten. The theoretical section has been considerably expanded, and a large number of problems of varying difficulty (with the answers to many of them) have been added. The sections on special procedures for ferro- and high-aluminium alloys have been modified on the basis of student experience. *Second Edition* 25*s.*

The International Library Suppliers

WITH THE ACTIVE SUPPORT of the world's leading Publishing Houses and the use of modern business methods and the latest office machinery, we have been able to establish, from many years' experience, a supply service for Libraries which is second to none.

Our Library Division offers the following facilities :

- Speedy, reliable and efficient service. Books and periodicals from every country at official rates of exchange.
- Large stocks of out-of-print books, sets and runs of periodicals.
- Regular News Service on new publications, free of charge.
- Extracts, photostats, or microfilms from out-of-print books or journals at low costs.
- Speedy service in hand-binding from our own bindery.
- Translations of foreign language articles.
- Purchase or exchange of surplus books and journals.

BY PLACING YOUR ORDERS WITH US you will be receiving all the advantages which a centralised Library Supply system can offer.

Forthcoming Books

An Introduction to

Electronic Analogue Computers

By C A A Wass, R A E, Farnborough

(The sixth monograph in the series Electronics and Waves, edited by D W Fry, Harwell)

This is the first British book to give a detailed account of the design operation and applications of analogue computers for electronic differential analyzers Clearly written and completely up to date, it indicates the theory and some of the practice of using analogue computers in practical problems, but emphasizes the equipment and its theory It will be of great importance to designers and users of such equipment, and to students and research workers seeking an introduction for general treatment

Demy 8*vo* *About* 270 *pages* *Well illustrated* 40*s*

Distributed in the Western Hemisphere by the McGraw-Hill Book Co.

Linear Feedback Analysis

By J G Thomason, A E R E, Harwell

This book will bridge the gap between the mathematical treatises on the subject and the works on the practical side of electronics technique A wealth of practical detail accompanies the analytical discussions, a great many illustrative designs taken from radar and nuclear physics research equipment are included, and the standard of mathematics required of the reader is that of an ordinary degree in science or engineering The book is comprehensive and up to date and will be of interest to the specialized circuit and servomechanism research worker, as well as to medical and biological workers with an interest in electronics technique, engineers working in nuclear instrumentation, etc

GRUBB PARSONS

SPECTROMETER AIR DRIER

1 Unit is designed for easy connection to any Grubb Parsons Spectromete Adaptation to other instruments is usually straightforward.
2 Flexible connections 1 in internal diameter are employed.
3 Charge of activated alumina is 80 lb. and life is at least 200 hours 1 cu ft per minute.
4 Unit can be moved about easily.
5 Drier can be supplied with or without Air Blower.
6 Blower is run at reduced voltage and is quite silent
7 A tapped transformer can be supplied as an alternative to the Variac wit some saving in cost
8 An internal heater is provided for trouble-free reactivation with eas measurement of alumina temperature
9 Provision is made for including soda asbestos for elimination of CO_2, required.
10 Drying can be extremely good under favourable conditions—down t 0 01 mg water per cubic foot
11 Unit can also be used for partial room drying by operating blower a full speed.
12 The Drier can be employed for any purpose for which extremely dr air is required.

SCIENTIFIC BOOKS, LIBRARIES & COLLECTORS

By John L Thornton and R. I. J Tully

A bibliographical approach to the history of science, recording the major writings and definitive editions of all the important scientists, from the earliest times to the end of the nineteenth century.

288 *pages*, 12 *plates* 24*s* (18*s to Library Association Members*)

THE LIPIDS

Their Chemistry and Biochemistry

by HARRY J DEUEL, Jr
University of Southern California, Los Angeles

In Three Volumes

VOLUME I: CHEMISTRY

CONTENTS General Characteristics and Classification of Lipids The Chemistry of Fatty Acids and Glycerol The Chemistry of Neutral Fats Waxes, Higher Alcohols Including Sterols, Triterpenes, Glyceryl Ethers, Colored Fats, and Hydrocarbons Chemistry of the Phosphatides and Cerebrosides Carotenoids and Related Compounds Distribution, Properties, and Chemistry of the Vitamins A. Distribution, Properties, and Chemistry of the Provitamins D and Vitamins D Distribution, Properties, and Chemistry of the Vitamin E Group. Distribution, Properties and Chemistry of the Vitamin K Group Author and Subject Index Index to Plant and Animal Sources of Lipids

1951 6 × 9 1008 pages, 102 illus, 341 formulas, 204 tables 168s

VOLUME II: BIOCHEMISTRY

Digestion, Absorption, Transport, Transport and Storage

CONTENTS Preface Introduction Digestion and Absorption of Fats in the Gastrointestinal Tract The Digestibility of Fats The Digestion, Absorption, and Digestibility of Lipids Other than Fats Blood Lipids The Occurrence of Lipids in the Animal as a Whole Lipid Distribution in Specific Tissues and in their Secretions Author Index Plant and Animal Sources of Lipids Subject Index.

1955 6 × 9 945 pages, 131 tables 200s

VOLUME III—In preparation.

"APIEZON" is a Registered Trade Mark of Apiezon Products Ltd

with APIEZON products

LEAD FOR RADIATION SCREENING

We have long experience of lead working and can supply any type of lead screen shield or collimating device either solid cast or fabricated and welded to your own design

We supply lead containers for storing and transporting radioactive isotopes. We also manufacture lead bricks for screening castles, etc, and lead items for any experimental purposes

The Faraday Society

THE BOURKE LECTURES

A LECTURESHIP, to be known as the Bourke Lectureship, has been established by the Society to enable distinguished scientists from overseas to lecture in London, Oxford, Cambridge and provincial university centres for the purpose of promoting the study of Physical Chemistry and allied subjects. It is proposed to hold these lectures once or twice a year.

Professor D. F. HORNIG, Ph.D.

(*Professor of Chemistry, Brown University, Rhode Island*)

has been invited to give the first Bourke Lectures

ON

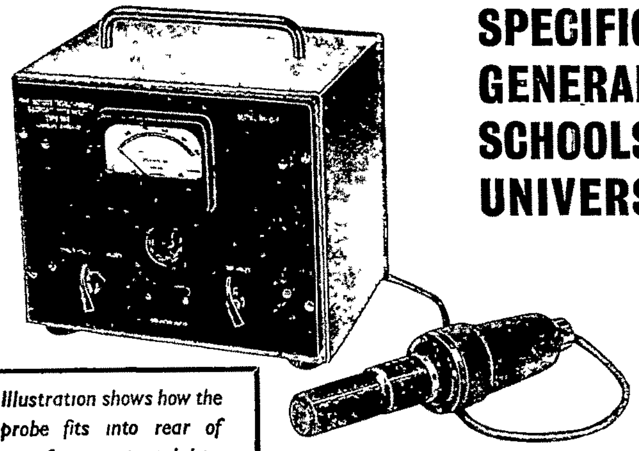
"**Spectra and Structure of Crystals,**" to be held in the Department of Chemistry, King's College, London, W.C.2, on Wednesday, March 2, 1955, at 5.30 p.m. (Chairman: Professor Sir Eric Rideal, M.B.E., D.Sc., F.R.S.)

"**Bond Moments and Molecular Structure,**" to be held in the Department of Chemistry, The University of Manchester, on Tuesday, March 15, 1955, at 4 p.m. (Chairman: Professor Geoffrey Gee, Sc.D., F.R.S.)

"**Application of Shock Waves to Chemical Problems,**" to be held in the Department of Physical Chemistry, The University, Cambridge, on Tuesday, May 3, 1955, at 4.30 p.m. (Chairman Professor R. G. W. Norrish, Sc.D., F.R.I.C., F.R.S.)

Admission free, without ticket. Non-Members will be welcome

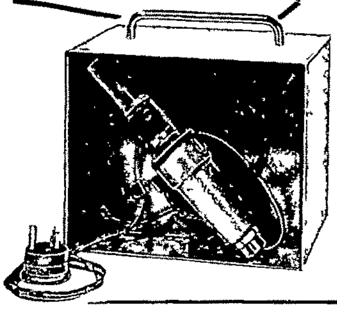
THE FARADAY SOCIETY,
6 Gray's Inn Square, London, W.C.1



SPECIFICALLY DESIGNED FOR GENERAL EDUCATION IN SCHOOLS, COLLEGES AND UNIVERSITIES

THE 'I D L' RADIOACTIVITY METER is robust and simple to use and capable of making a wide range of measurements on beta and gamma rays Also suitable as an inexpensive general purpose laboratory monitor

Illustration shows how the probe fits into rear of unit for easy portability.



- ***Trigger "flash" for low count rates and checking purposes.***
- ***Weston Meter Indication 0-50 counts/second.***
- ***Adjustable E.H.T. 300-600 volts indicated on meter, for plateau measurements.***
- ***Self-contained with probe and G.M. tube for beta and gamma counting.***

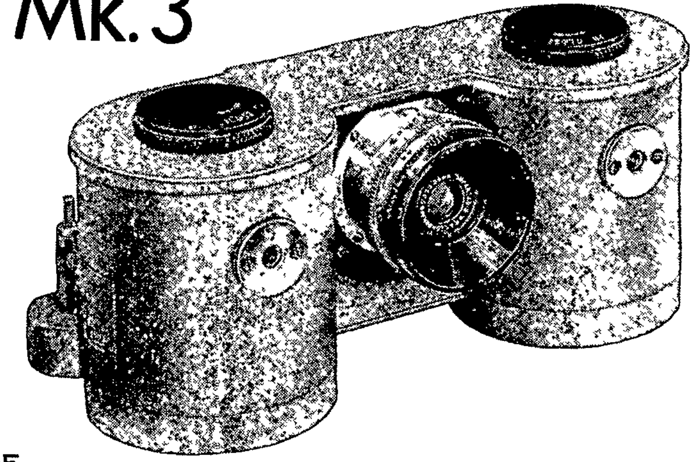
The Auto Camera Mk.3

A VERSATILE RECORDING INSTRUMENT



Specially designed to cover a wide field of industrial and scientific work where the rapid production of high quality microfilms is required It is eminently suitable for such purposes as instrument recording, photomicrography, oscillograph records, process timing, document copying, etc. It is fully automatic in its operation, the exposure and film transport being effected by a single electrical impulse operating on 12 or 24 volt d c. Special daylight loading cassettes give a full 200 1" × 1" or 300 1" × $\frac{3}{4}$" exposures from one loading of 35 mm perforated film. The camera may also be controlled by manual operation

Watson Stereoscopic Microscopes will satisfy the most fastidious user.

They are available in a wide range of stands and can be fitted with a variety of optics Offering, as they do, a true stereoscopic image, they can be applied to any problem where the three dimensions, length, breadth and depth, are to be investigated The illustration is of the "Box-Foot" model Write for List 6B

WATSON'S

W. WATSON & SONS LTD. 313 HIGH HOLBORN, LONDON, W.C.1

THERMOSTATIC WATER BATHS MADE BY GRANT INSTRUMENTS

(1) Cover the range from 10° to 90° C, with a differential of ± 0.25° C. The whole range is clearly marked out on the dial, in single degrees, and the required temperature can be precisely set.

(2) Are fitted with an accurate bimetallic thermostat, of new design, which works on the micro-switch principle without a relay and without arcing at the contacts.

(3) Have extremely efficient stirring, by induction motor, which ensures that there is no measurable temperature gradient throughout the bath.

(4) Have 1500 or 3000 watt heaters which give very rapid heating

(5) Can now be fitted with fan cooling to the control box, recommended for continuous operation over 40° C., to prevent overheating and condensation.

(6) Are protected by a strong wooden casing, with air gap, giving good heat insulation.

(7) Are unconditionally guaranteed for 12 months, and covered by a 48 hour repair service.

Type UB2 is a heavy steel pressing, vitreous enamelled. The non-drip lid is of aluminium. All SB types are of stainless steel with stainless steel non-drip lids

Standard Types	*UB2*	*SB1*	*SB2*	*SB3*
Working Space	18"×8¼"×6¼"	10"×8¼"×7"	17"×8¼"×8"	21½"×12"×11½"
Shipping Weight	56 lb.	48 lb	56 lb.	100 lb.

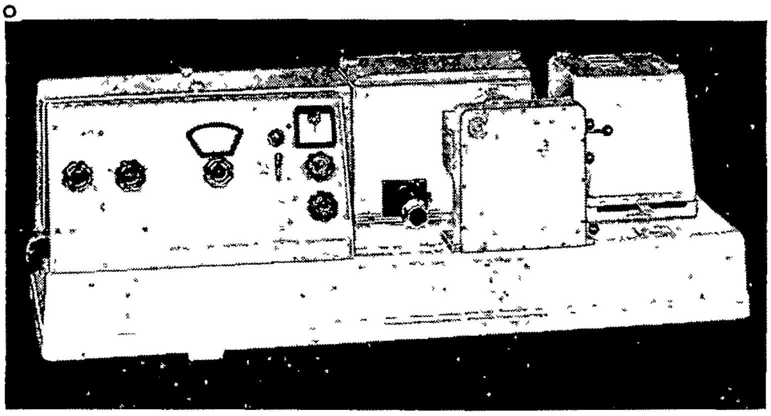
NEW UVISPEK

photoelectric spectrophotometer

THE NEW UVISPEK is an outstandingly sensitive and accurate photoelectric spectrophotometer for use in the ultra-violet and visible regions, with a very wide field of applications in the research and industrial laboratory. Its outstanding features are :



REDESIGN OF MEASURING UNIT gives even greater ease of servicing and operation.

MEASUREMENTS OVER THE FULL U-V AND VISIBLE RANGE from 200 to 1,000 mμ can be made with quartz prism.

DISPERSION, NEARLY FOUR TIMES AS GREAT, in the visible region with optional glass prism.

NO BATTERIES are used ; simply connect to A.C. mains.

EXCEPTIONALLY HIGH SENSITIVITY which can be reduced when it is too great for the measurement in hand.

PROVISION FOR FLAME ATTACHMENT without removing lamp-house.

QUICK DELIVERY ; REASONABLE PRICE.

Please write for fully illustrated catalogue CH318 (N.2)

HILGER & WATTS LTD. HILGER DIVISION
98 St. Pancras Way, London, N.W.1, England

Member of the Scientific Instrument Manufacturers' Association and of SCIEX

The Corporation maintains close touch with the East African Agricultural and Forestry Research Organization and with the East African Tsetse and Trypanosomiasis Research and Reclamation Organization, as well as with departments of the Tanganyika Government and other bodies; but the work of the Scientific Department is presented on a regional basis in what forms the longest chapter of the report. Among some points of interest are the slight increase in plant population and the big increase in yield obtained in experiments on the control of weeds in maize with 'Fernoxone' at Urambo; the absence of any significant increase in yield of soya bean and maize on deep placement of triple phosphate fertilizer although the standard method of placing fertilizer gave highly significant increase; the identification in South Tanganyika of the maize rust *Puccinia polysora* Underw.; and the continued trials and experiments on the development and improvement of agricultural machinery. Soil fertility studies were restricted to maize, and little progress is reported in the determination of the phosphate status of soils by chemical tests.

METEORIC PARTICLES IN THE ATMOSPHERE

ZDENĚK ŠVESTKA, Astronomical Institute of the Czechoslovak Academy of Sciences, Ondřejov, has a paper in *Bulletin of the Astronomical Institutes of Czechoslovakia* (5, No. 5, Sept. 1, 1954), in which he criticizes F. Link's theory of the fall and absorption influence of meteoritic particles in the atmosphere. This theory has been explained in some of the *B.A.C.* issues over several years, and the time of fall T in seconds through 100 km may be expressed by Link's approximate formula

$$\log_{10} T = C - 1{\cdot}5 \log_{10} \rho$$

where $C = 1.4$ for metallic particles and 1.6 for stony particles, the radius of the particles in all cases being ρ. According to this formula, the time of fall of 30–100 days would correspond to particles the diameters of which in the limit would conform with the relation $4\mu < 2\rho < 14\mu$. From a study of the absorption influence of particles of different diameters Link also constructed an empirical formula for the number n of particles of iron and silicates of different sizes

$$\log_{10} n = \text{constant} - 600\,\rho$$

and making use of other data, concluded that the absorption in a layer of meteoric dust is caused predominantly by particles with diameters from 2μ to 6μ.

Švestka has now examined Link's assumptions and deductions and concludes that the latter are inaccurate in many cases. Observations of absorption effects of a dust-layer in the atmosphere during lunar eclipses can be satisfied only when the optical thickness of the layer is equal to 0.01 as a minimum. A table gives for different values of ρ the minimum possible time of fall for which the above optical thickness is assumed, and also the maximum quantity of meteoric matter falling on the earth, which, it is shown, cannot exceed 5×10^{-14} gm. cm.$^{-2}$ sec.$^{-1}$, and proves that it is quite impossible—from the optical point of view—that the observed absorption could be caused by particles larger than 1μ. Link's theoretical conclusions were based on Thomsen's results of collections of atmospheric iron particles, the diameters of which ranged from 10μ to 80μ; but there is very strong evidence from the collection of similar particles in the industrial country of Jena that the meteoritic nature of Thomsen's particles must be open to considerable doubt. It seems probable that meteoric dust is formed by much smaller particles of the order of 10^{-5}–10^{-6} cm., and it is suggested that a study of the sky-light polarization, during and after the activity of strong meteor showers, might provide a decisive answer to the problem under investigation.

THE EARTH'S EXTERIOR ATMOSPHERE AND THE COUNTERGLOW

UNDER this title, the Canadian Defence Research Board has published a second augmented edition of material prepared by E. R. Hope*. In the main this consists of Mr. Hope's translations of recent Russian papers (two more than the first edition) of very great interest concerning observations and theories about the outermost atmosphere of the earth.

The Russian astronomers, Astapovich, Fesenkov, Divari and Karimov, have a particular claim to our attention, for they enjoy in some parts of their country a clarity of the sky which is unrivalled and which is a great asset to the observations concerning the outermost atmosphere and the counterglow. Their revolutionary theories are based in part on new observational discoveries, and their speculations make good use of all the knowledge there is on the subject. They establish that the observational material is in accord with the suggestion that a gaseous tail stretches away from the earth, resembling the tail of a comet, in the direction opposite to that of the sun. They do not suggest that the processes responsible for the heating of the outermost atmosphere or for the acceleration of the gas spraying off in the tail are at all understood.

The translator's foreword of twenty-six pages aims at reviewing the entire subject in a critical manner, and at establishing the relation between these outer atmosphere researches and those connected with magnetic and auroral effects. Much of this could come under severe criticism, and one suspects that most of the authors mentioned would disagree with the arguments presented that oppose their points of view, but equally with those that are in their favour. Those who are concerned with these subjects will have to go over the literature and the arguments for themselves, anyway; and those who would appreciate a passing acquaintance cannot be advised to gain it here, for they are unlikely to appreciate that another review article might, with equal justification, reverse very many of the arguments.

The translations of the Russian papers read well, and make a valuable contribution to the literature accessible to most Western astronomers and to those concerned with upper atmosphere research.

T. GOLD

MOBILITY OF MANGANESE, MAGNESIUM AND POTASSIUM IN LEAF TISSUES

By H. C RUCK and Prof. F G. GREGORY, F.R S

Research Institute of Plant Physiology, Imperial College of Science and Technology, London, S.W 7

BY the use of rooted leaf cuttings, the mobility of metallic elements from fully active leaves can be studied in a simple way Leaves with axillary buds were detached from potato plants grown in sand culture supplied with nutrient solutions so that the level of the element in the leaves could be controlled. The isolated leaves were set to root in sand or appropriate culture solution, and after fourteen days root formation began, and in most cases the axillary bud grew out into a shoot. At the time of planting out, one leaflet of a pair was removed and analysed The axillary shoot developed deficiency symptoms when the cutting was grown in solutions deficient in the element under investigation When the symptoms had become marked, the opposite leaflet of the pair was removed and analysed The accuracy of the method for determining movement of the element from the leaf depends on the high correlation between mineral content of the paired leaflets. The following mean values were obtained for the distal pair of leaflets in μgm.

Mn (12 leaflets)	2·56	2·46
Mg (10 leaflets)	116	106
K (10 leaflets)	420	360

Manganese

Leaf-bud cuttings with high and relatively low manganese content were used and after rooting transferred to a culture solution without manganese

Typical symptoms of manganese-deficiency appeared in the shoot after twenty-three days in the low-manganese leaves, and after thirty days in the high-manganese set. The subtending leaf meanwhile remained normally green and without any symptoms. The analyses of the leaflets for manganese (p p m in dry weight) at the beginning and after forty days were as follows

		At planting out	After 40 days	
High Mn cuttings	grown in Mn deficient solution	150	148	Mean of 8 replicates
Low Mn cuttings		25	20	Mean of 13 replicates

The appearance of the high-manganese cuttings at the end of the experiment is shown in Fig 1, *A* The axillary shoot shows severe deficiency, while the subtending leaf remains healthy In neither series has the concentration of manganese in the subtending leaf fallen to any marked degree, indicating that manganese is not transported from the active leaf to the growing bud

Magnesium

A similar experiment was carried out using plants grown in a full nutrient solution The cuttings, after rooting, were grown on either in a solution containing magnesium or completely magnesium-free Symptoms of magnesium-deficiency appeared in the set grown without magnesium after thirty-seven days in the form of grey spots and scorch on the lower leaves of the shoot After forty-nine days the experiment ended

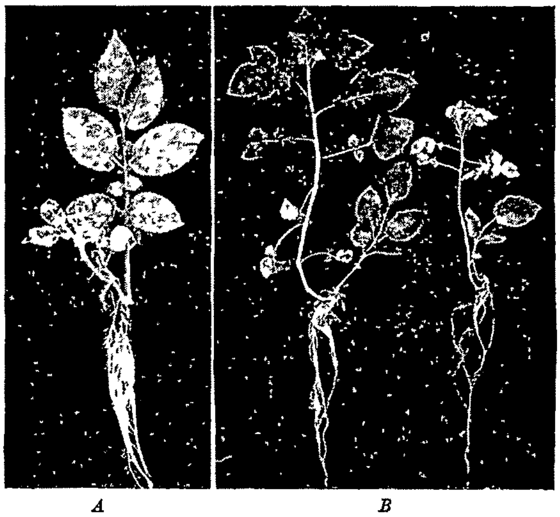

Fig 1 *A*, Leaf-bud cutting from a potato plant grown at high-manganese level, and after rooting transferred to a manganese-free solution *B*, leaf-bud cuttings taken from a plant grown at high-magnesium level and after rooting transferred to a solution with magnesium (left) or devoid of magnesium (right)

The content of magnesium in a pair of leaflets of the subtending leaf (μgm) at the beginning and end of the experiment was as follows

	After 21 days	After 49 days	
Cuttings in solution with Mg	139	435	Mean of 8 replicates
Cuttings in solution without Mg	127	102	

The appearance of the cuttings is shown in Fig 1, *B* on left, cuttings supplied with magnesium, on the right, cuttings grown without magnesium The leaves of the shoot without magnesium are almost devoid of chlorophyll, while the subtending leaf has remained healthy and without symptoms The experiment indicates that magnesium is not readily transported from the subtending leaf to the developing bud.

Potassium

Potassium is known to move freely about the plant, and as a check on the method a similar experiment was carried out with this element Leaf cuttings were taken from plants grown in full nutrient solution, and transferred after rooting either to full nutrient or potassium-deficient solution The potassium content (μgm) of leaflets of the mother leaf at beginning of the experiment and after forty-two days is shown below

	At start	After 42 days	
Cuttings in solution with K	264	673	Mean of 2 replicates
Cuttings in solution without K	276	164	Mean of 11 replicates

In contrast with the behaviour of manganese and magnesium, the potassium content of the subtending leaf has fallen considerably, and deficiency symptoms appeared not only on the axillary shoot but also on the mother leaf, the former showed brown areas of discoloration and bluish-green colour of the leaves, while the latter showed marginal scorch and necrotic interveinal areas.

STRUCTURE OF TOBACCO MOSAIC VIRUS

By Dr. ROSALIND E. FRANKLIN

Birkbeck College Crystallography Laboratory,
21 Torrington Square, London, W.C.1

TOBACCO mosaic virus is a rod-shaped virus, of (most frequent) length 3000 A.[1], diameter 150 A.[2], and molecular weight 50 million[1]. It contains 6 per cent by weight of ribonucleic acid, the remainder being protein. Many chemical and physico-chemical studies indicate that the tobacco mosaic virus protein may be built up of identical or nearly identical sub-units of low molecular weight[3–7]. A similar conclusion has been reached as a result of X-ray diffraction studies[2,8]. More recent X-ray work, the results of which are summarized here, provides further evidence for a protein sub-unit of molecular weight consistent with that obtained by chemical methods, and also gives more indication of the arrangement of the protein chains within the sub-unit.

Chemical Evidence

End-group determination using carboxy-peptidase indicates that all C-terminal amino-acids are threonine, and gives a minimum molecular weight of 17,000[4,5]. The amino-acid present in smallest quantity is cysteine. The cysteine content of tobacco mosaic virus is constant in all strains and corresponds to a minimum molecular weight of about 18,000[6]. The molecular weight of the protein fragments obtained by disintegrating the virus with sodium dodecyl sulphate has been given as 10,000–20,000[7], and here again the only C-terminal amino-acid is threonine[6].

Schramm[9] found N-terminal proline in amount corresponding to the C-terminal threonine, but Fraenkel-Conrat and Singer[7] showed that his analytical method was capable of breaking peptide bonds. Unable to detect any N-terminal amino-acid, these authors conclude that tobacco mosaic virus protein has a cyclic structure.

Several authors have shown[10] that, in certain circumstances, a protein of low molecular weight having properties similar to the protein obtained by degradation of tobacco mosaic virus is present in the sap of infected but not of normal plants. This protein has been shown to be capable of aggregating to form rods of the same diameter as the virus but free from ribonucleic acid, and to possess the serological properties of the virus.

Thus a large body of chemical evidence points to the existence in tobacco mosaic virus of a protein building unit of molecular weight between 10,000 and 20,000.

Helical Structure of Tobacco Mosaic Virus

Watson has suggested[8], on the basis of X-ray diffraction studies, that tobacco mosaic virus has a helical structure such that the virus particle can be considered as one giant helical molecule. By analogy with turnip yellow mosaic virus and bacteriophage *T*2, two very different viruses for each of which it is believed that the nucleic acid occupies a central position and is surrounded by a protein shell[11], he suggested that, in tobacco mosaic virus also, the ribonucleic acid may form a central core, around which lie molecules of globular protein in helical array.

Applying the theory of X-ray diffraction by helical structures[12] to the measured positions of the innermost intensity maxima on the layer-lines of the tobacco mosaic virus diagram, Watson concluded that the axial repeat period of 68 A. contains three turns of the helix, on which lie $3n + 1$ protein building units. The observation of an apparently meridional maximum on the 31st layer-line suggested that n was equal to 10. Using this value, and the results of Williams[1], the molecular weight of the protein building unit comes to 35,000—about twice that found by chemical methods.

Infra-red measurements[13] suggested that the protein might be in the form of Pauling α-helices[14] lying perpendicular to the axis of the virus, and Watson pointed out that the pitch of the virus helix, 23 A., would allow of a double layer of α-helices.

X-ray diffraction pictures with improved orientation and resolution have now been obtained, and studied in detail. The diagram shown in Fig. 1 is from a gel of approximately 25 per cent by weight of tobacco mosaic virus, contained in a thin-walled glass capillary of bore 0·4 mm. The intensity distribution on some twenty-five layer lines has been measured, and used for calculating the cylindrically averaged Patterson function shown in Fig. 2*a* and *b*.

The cylindrical Patterson function and the X-ray fibre diagram are simply two ways of presenting the same set of data; in attempting to interpret the data, it is often helpful to look at them in both forms. We shall consider first some information which can be derived by direct inspection of the X-ray diagram.

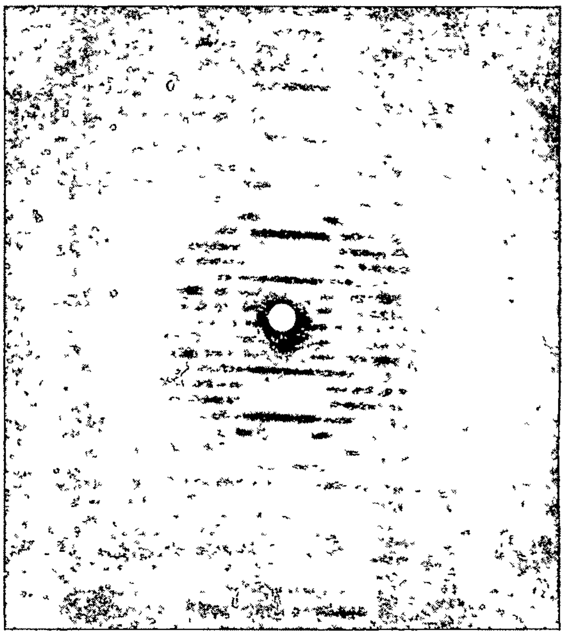

Fig. 1. X-ray diagram of tobacco mosaic virus gel. Orientated specimen obtained from N. W. Pirie's preparation of the virus, Rothamsted culture, incubated with proteolytic enzymes

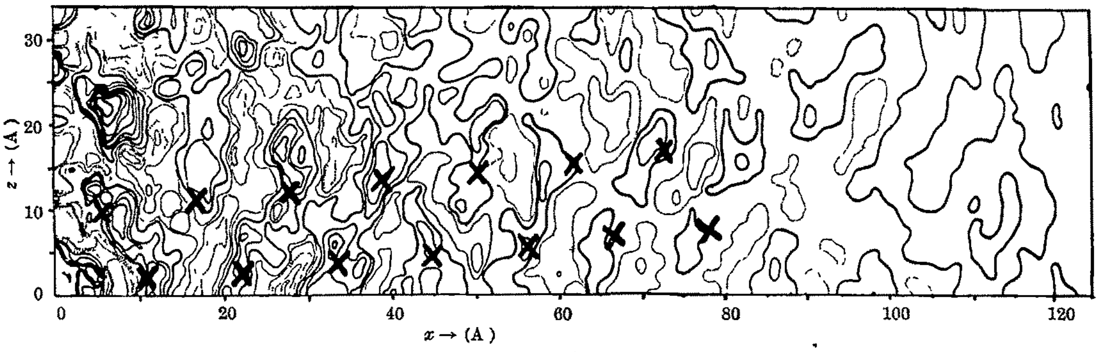

Fig 2a

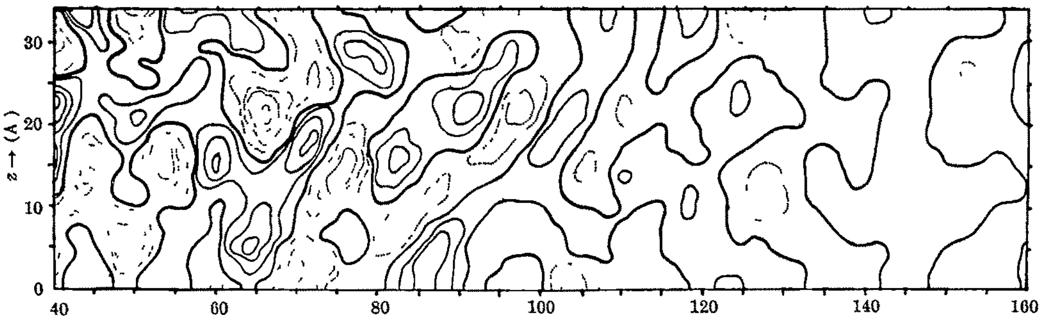

Fig 2b

Cylindrical Patterson function of tobacco mosaic virus For Fig 2b (large values of x) a strong 'artificial temperature factor' has been used

More accurate measurements of the positions of the first maximum on each layer line confirm most satisfactorily Watson's conclusion that there are $3n + 1$ units on three turns of the helix However, the maximum on the 31st layer line is found not to be truly meridional, but to have a value for ξ/λ of less than $30\,A^{-1}$. All other maxima stated by Watson to be possibly meridional have now been shown to be off-meridional. The only central maximum not yet resolved into two peaks lies on the 37th layer line, indicating that n may be 12. Although one cannot be sure that this peak, too, could not be resolved with further improvement of technique, and although in a complex structure it is always possible that the maximum looked for may be absent owing to phase-cancellation, it seems fair to state at the present stage that the most probable value of n is 12.

Assuming that there are $3n + 1$ units in three turns of the helix, then, from the observed positions of the innermost maxima on layer-lines of type $3m + 1$, $3m + 2$ (m any integer), an upper limit to n can be obtained In this way, the first observed maxima on the 1st and 11th layer-lines both show that n cannot possibly be greater than 14. Since observations have been made as far out as the 45th layer-line, this makes it unlikely that a strong central maximum on the layer-line $3n + 1$ has passed unobserved.

If n is 12, the molecular weight of the protein building unit is 29,000.

That it is difficult to be sure of the exact number of units per turn probably means that there is no great fluctuation in electron density in passing from one unit to the next on the same turn of the helix. The pitch of the helix, on the other hand, is quite unmistakable, and undoubtedly there is an important structural discontinuity in crossing from one turn of the helix to the next.

Shape of the Virus Particle

There is some evidence of an external grooving of the virus, the groove following the line of the helix. This is suggested, in the Patterson function, by the peak region lying between 135 and 155 A in x, a position corresponding with the known diameter of the particle. The shape of this peak, having necks at the base line and at the pitch height and bulging symmetrically on either side of these positions, can best be explained by supposing that the particle has a screw-like contour, and some slight excess of density at the surface (The excess surface density may well be due to extraneous matter, since the specimen was prepared by evaporation of a more dilute solution)

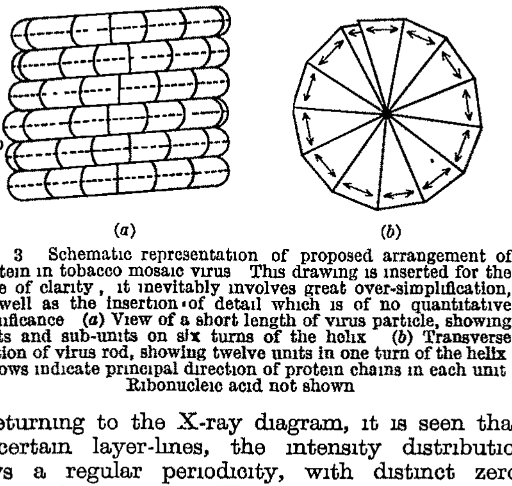
Further evidence of such grooving is provided by the 3rd layer line, the form of which shows that the outermost shell of the virus has very strong fluctuations of density with a period equal to the pitch of the helix. Again, grooving is the simplest explanation. This central region of the 3rd layer-line is found to be greatly modified in X-ray diagrams of air-dried orientated tobacco mosaic virus, as would be expected if the grooves are filled with water in the wet state and with air in the dry state

It has been suggested, as the result of electron microscope studies, that the cross-section of tobacco mosaic virus may be hexagonal[15]. If this were so, one would expect a dry specimen of the well-orientated virus to form a close-packed mass of uniform density We find, however, that strongly dried specimens show strong form birefringence (much higher than that of slightly damp specimens), and also very strong equatorial reflexions at spacings of about 70 and 50 A Both these observations show that there are holes between the particles in the strongly dried material, which is inevitable if the particle contour is helically grooved

Distribution of Scattering Matter within the Virus

We must now consider the shape of the protein building unit, and the distribution of scattering matter within it. Here some indication can be obtained from the Patterson function. It must be emphasized, however, that in the cylindrically averaged Patterson function of such a complex structure, it is probable that some important structural features will be entirely obscured, and others distorted. The interpretation here suggested, even if partially correct, certainly involves great over-simplification.

The array of peaks indicated by crosses in Fig. 2*a* suggests an end-on view of a double layer of rods of diameter 11 A This is consistent with the suggestion that the protein unit contains a double layer of α-helices running perpendicular to the axis of the particle. Moreover, the linearity of this long series of peaks suggests that the rods lie in a tangential rather than a radial direction with respect to the particle axis This type of arrangement is shown schematically in Fig 3



(*a*) (*b*)

Fig 3 Schematic representation of proposed arrangement of protein in tobacco mosaic virus This drawing is inserted for the sake of clarity, it inevitably involves great over-simplification, as well as the insertion of detail which is of no quantitative significance (*a*) View of a short length of virus particle, showing units and sub-units on six turns of the helix (*b*) Transverse section of virus rod, showing twelve units in one turn of the helix Arrows indicate principal direction of protein chains in each unit Ribonucleic acid not shown

Returning to the X-ray diagram, it is seen that, on certain layer-lines, the intensity distribution shows a regular periodicity, with distinct zeros between the maxima. This suggests that the projection of the structure on to an axial plane is approximately centro-symmetric (I am grateful to Dr. F. H. C. Crick for pointing this out), which again points to the sub-division of the main building unit of the helix into two near-equivalent parts related by a diad or pseudo-diad perpendicular to the axis of the particle, the complete structure of the protein being thus a combination of two equivalent co-axial helices

On the equator, the first four maxima lie close to those which would be given by a rod of uniform density of diameter 150 A. This, together with the regular periodicity of intensity, has made it possible to determine the signs of the first twelve equatorial maxima, and hence to calculate a Fourier projection of the virus. The most prominent feature of this projection (which will be presented and described in detail elsewhere) is a ring of high density at a radius of 55 A. This may suggest that the virus ribonucleic acid lies on this radius. An alternative explanation is that the ribonucleic acid in tobacco mosaic virus is heavily hydrated and lies at the centre, while the heavy shell of radius 55 A is simply a region of low hydration.

It is often supposed that there is no internal hydration in tobacco mosaic virus. However, when the air-dried virus is strongly dried at room temperature, there is a loss of weight of about 10 per cent Moreover, the scattered intensity on layer lines $3m + 1$ and $3m + 2$ becomes much weaker, showing that the degree of order within the protein building unit is reduced. This effect is comparable with the deterioration which occurs in the X-ray diagrams of single crystals of protein when the water of hydration is lost, and suggests that the virus protein also is to some extent hydrated

A detailed study of the 6th layer line in the tobacco mosaic virus diagram shows that the strong central region is mainly due to a second-order Bessel function contribution from a cylindrical shell of radius 55 A. This coincides with the high-density shell revealed by the Fourier projection, and it thus appears that the high-density shell must have a strong periodicity of 11 A. in the axial direction

To summarize, X-ray diffraction studies indicate that the protein of tobacco mosaic virus is in the form of structurally equivalent units of molecular weight about 29,000 arranged on a helix of pitch 23 A., there being $3n + 1$ such units on three turns of the helix, with n probably equal to 12. These units appear to be subdivided, along a plane approximately perpendicular to the axis of the helix, into two equivalent or near-equivalent sub-units. The molecular weight of these sub-units is consistent with the minimum molecular weight obtained by chemical methods

There is an important structural discontinuity between one turn of the helix and the next, and this appears to be associated with an external grooving of the particle This feature of the structure, which gives the virus a rather large external surface, may perhaps account for the surprising variety and extent of chemical modifications which it is possible to make in tobacco mosaic virus without breaking up the particle and, in some cases, without destroying its infectivity[16]. There is thus reason for hoping that further chemical work on the accessibility of the different amino-acids, together with X-ray studies of the chemically modified forms, may help to elucidate not only the configuration of the protein chains, but also the positions of certain amino-acids in the virus.

I am grateful to Prof J. D Bernal for his interest and encouragement, to Mr. N W Pirie for providing me with the purified tobacco mosaic virus, and to many American workers at Berkeley, Pasadena, St Louis and elsewhere, for stimulating discussions.

The 'Horizon' of the Steady-State Universe

In a recent article on "The Age of the Universe" in *Nature*[1] there has been a call for a further explanation of the nature of the 'horizon' or the 'size' of the universe as it is defined in the steady-state theory. The subject is mathematically quite clear, and geometrical properties follow from the fact that the de Sitter space is the applicable one. Thus in the original papers on the subject by Bondi and Gold[2] and by Hoyle[3] there is no ambiguity. Pirani[4] has published a lucid mathematical discussion of the 'horizon', or the observable size of that type of universe. The present discussion is therefore merely a descriptive supplement.

There is no simple answer to the question: 'How big is that universe?' The theory is concerned only with quantities that can be measured observationally, or that could be so measured were it not for some obviously only technical limitation. Some of the questions that may be asked are discussed below.

(1) 'Out to what distance could we now see galaxies?' With any given observing apparatus of fixed limitations as to the energy density and the frequency of the light required for an observation, this will be a finite range. The number of galaxies that can be seen is then also finite. This will be so whatever the actual limits of the apparatus may be, so long as it requires finite amounts of energy for an observation. An improvement of the sensitivity of the apparatus would always give an increase of the range (but not in proportion).

(2) 'If we continued observations with a given apparatus for a very long time, what changes would we see?' In the course of time, the farthest galaxies that we could see will drop out of the observable set because their light will appear fainter and of lower frequency until it is below the threshold of the apparatus. At the same time other galaxies will become brighter as they grow bigger, and newly formed ones will become visible. Originally bright ones will fade towards the limit of observability. Statistically, the population will remain the same, though there will be losses and gains. The 'observational horizon' will always be at a finite range, constant for any given instrument, but greater the more sensitive the instrument.

(3) 'If we sent out a powerful light pulse now, where could it be received?' Such a signal will reach that set of galaxies which are at present nearer than a certain distance (given by Hubble's constant) from us. That is a finite number. But it will also reach all those galaxies that will have formed within the expanding space defined by the first set, in time to intercept the light. That is an infinite number. If reception is to imply recognition, and therefore a finite amount of energy at the receiver, this would limit the number to a finite one; but there is no limit in principle to the number of galaxies that could be informed of our pulse by the use of intermediate relay stations.

(4) 'Is there a last moment before which a light pulse has to be emitted here to assure its arrival at a specified galaxy?' Yes. If the signal is sent later than that moment it will not get to that galaxy. (This is not a question of observational technique.)

(5) 'Is there a last moment for the reception of light signals from another galaxy?' No. There is no last moment of reception defined in the theory. The last signal emitted by another galaxy that could be received here would, however, be drawn out in time so that it would take an infinite time for it to arrive, however short a pulse it may have been at its emission. This absence of a defined instant at which reception must cease does not mean that the act of disappearance is in doubt, but only that the moment at which it occurs is related to the particular method of observation. A change to more sensitive methods of observation would delay the disappearance of any one galaxy, but provided the method of observation is kept the same, the mean rate of disappearance from view will be constant (and equal to the rate at which new ones are appearing in the realm surveyed by that instrument).

So far as any actual, or in principle possible, observation is concerned, that universe is finite. The flow pattern of information there is analogous to that in a population which has a finite number of members at any instant, but which is in a steady state for all time. If I were a member of such a population I could obtain information (say, in writing) from an unlimited set that have lived before now, and I could leave information for an unlimited set in the future. But there would only be a finite number with whom I could now have a two-way conversation. Any one of that number will also belong to one, or more generally to both, the unlimited sets.

[3] *Mon. Not. Roy. Astro. Soc.*, **108**, 372 (1948).

[4] *The Observatory*, **74**, 172 (1954).

Mr. Gold's statement is very clear, and those interested in cosmology will be very grateful to him for making it. Unfortunately, however, it only increases the uncertainty which has arisen regarding the actual implications of the theory with respect to the observable horizon, since it appears to be in direct conflict with statements made in the paper by Hoyle which Mr. Gold now cites as one of "the original papers on the subject". In that paper Hoyle says: "Extragalactic nebulæ are continually passing out of the observable universe . . . The oldest condensation within the observable universe . . . has an age of about 1.5×10^{10} years". If a nebula passes out of the observable universe there must have been a time when it was within it (that is, was observable), and a later time when it was not observable. Hence there must have been a time when it ceased to be observable. But Mr. Gold now says: "Is there a last moment for the reception of light signals from another galaxy? No. There is no last moment of reception defined in the theory".

It is clear from Hoyle's paper that the "passing out of the observable universe" was not introduced as an effect of instrumental imperfections: it has been generally interpreted as an effect of the nebula reaching, at a finite distance and within a finite time, the velocity of light. Statements to this effect are numerous. For example, Dingle, speaking in February 1953, assumed that the theory required that "nebulæ are continually receding into inaccessibility by surpassing the speed of light"[1]. Still earlier, in May 1952, the Astronomer Royal, in describing the theory at a Friday Evening Discourse at the Royal Institution[2], said that "at a distance of about two thousand million light years the rate of expansion becomes equal to the velocity of light. At that distance we have, therefore, an observational horizon, beyond which we can never see. . . . As the creation of matter is at the rate needed to keep the mean density of matter in the Universe constant, the rate at which galaxies are being born just balances the rate at which they are lost to view". Neither of these statements, which Mr. Gold's letter now contradicts, seems ever to have been corrected.

If, as Mr Gold now says, "A change to more sensitive methods of observation would delay the disappearance of any one galaxy", what is the meaning of Hoyle's statement that "the oldest condensation within the observable universe . . . has an age of about $1·5 \times 10^{10}$ years"? What particular method of observation corresponds to this figure?

In view of these and other questions that will doubtless arise when the whole matter is reviewed in the light of Mr. Gold's new explanation, the need seems imperative for a clear and authoritative statement either reconciling the earlier and later assertions or else stating which is to be accepted as the true postulate of the theory.

Influence of Liquid Films on Fibre Friction

Bowden and Tabor[1] have shown that the adhesive force between a smooth sphere and a smooth plane due to a surface film of liquid is independent of the amount of liquid held between the surfaces. This is not true for the case of a cylinder in contact with a plane, when the adhesive force per unit length of cylinder is

$$A = 4\nu\sqrt{R/r}, \qquad (1)$$

where R is the cylinder radius, r the radius of curvature of the liquid meniscus and ν the surface tension. According to (1), A will increase as r is reduced by decreasing the amount of liquid present. The adhesion will not become infinite, but its maximum value will be determined by the tensile strength of the liquid or by the surface roughness.

The effect is easily demonstrated for a relatively thick glass fibre adhering to a glass plate by adding water and measuring the adhesion as the water evaporates. With a fibre 0·1 cm. in diameter, values of A up to 2 gm./cm. are readily obtained. The adhesion cannot, however, be measured directly in this manner for fine textile fibres, but it can be measured indirectly in so far as it modifies the apparent frictional coefficient when rubbing takes place on a smooth surface in the presence of a liquid film.

Fibre frictional coefficients are generally measured by the 'bollard' method for which the well-known relation,

$$T_1/T_2 = \exp \mu_A \theta, \qquad (2)$$

is employed, where T_1,T_2 are the fibre tensions, θ is the angle of contact between fibre and cylinder and μ_A the coefficient of friction. In the presence of an adhesion force A, relation (2) will take the form,

$$\frac{T_1 + A\rho}{T_2 + A\rho} = \exp \mu\theta,$$

when ρ is the cylinder radius and μ the true coefficient of friction. Then by measuring values of T_2 for two different values of T_1, it is possible to determine both A and μ. Some results obtained using a nylon fibre and a polished glass cylinder are shown in Table 1. No attempt was made to fix the thickness of the oil film, which was simply reduced in thickness by wiping with a clean cloth. The oil used had a viscosity of about 1 c.g.s. unit and a surface tension of about 30 dynes/cm., the cylinder diameter was 5·9 cm.

Table 1

Oil film	μ	A	μ_A, from (2)
As originally applied	0·4	0·10 gm./cm	0·62
Cylinder wiped once	0·4	0·17 gm./cm	0·79
Cylinder wiped again	0·4	0·26 gm./cm	1·10

In the case of the thinnest oil film, the experiment was repeated using a wool fibre, and the values $\mu = 0·4$ and $A = 0·03$ gm./cm were obtained.

It is plain that the surface roughness of the wool fibre resulting from the surface scales has eliminated adhesion effects to a large extent.

Non-linear Microphonic Response of Labyrinth Organs to Stimuli consisting of Two Pure Tones

IN a study of the microphonic effect of the lateral line of fishes[1], we found a remarkable response to a stimulus consisting of two pure sine waves acting at the same time on the sense organ. These effects are demonstrated by Fig. 1, curves *A*–*C*.

The most interesting aspects of these curves are (1) The frequency of the response (*A* and *B*) is twice the frequency of the stimulus. (2) In the combined effect (*C*), the response to the high frequency is large at the negative peaks and small at the positive peaks, the latter correspond (approximately) to the equilibrium position of the organ. (3) The maximum response to the high frequency in *C* is much larger than if this frequency is presented alone (*B*), with the same amplitude. The quotient of the two responses will be called the 'amplification'. This amplification depends on the amplitudes of *a* and *b*.

We are still convinced that the explanation of the double frequency given in our earlier paper[1] is correct. It is not found in the microphonic effect of the cristæ of the semicircular canals and of the

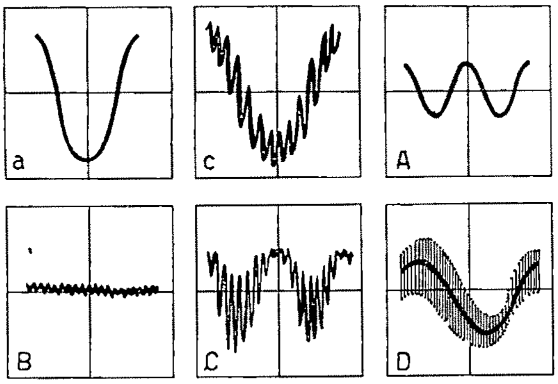

Fig 1 Curve *a* Waveform of the low frequency *c* Waveform, if a high frequency with smaller amplitude is superimposed on the low frequency *A* Response of the lateral line organ to stimulus *a* (double frequency) *B* Response to the high frequency alone (Oscillogram *B* was photographed for another frequency, but it has the right amplitude) *C* Response to *c* *D* Response of a labyrinth organ to stimulus *c* (schematical)

cochlea The further quantitative analysis of the phenomena, however, revealed fundamental difficulties in the explanation which was given for the effects under (2) and (3). This will be described in more detail in the thesis of one of us (J. W K). Hence it seems probable that these two effects are due to the sense cells themselves, so that the labyrinth organs should also give a similar response. Indeed, this was checked for the cristæ of the semicircular canals as well as for the cochlea of the pigeon by one of us (D R U) This has now been checked for mammals with positive result.

There are some minor differences between the cochlea and the other organs studied. Though in all cases a 'zero-point' in the output for the high frequency is found, it is generally on the rising part of the curve for the cochlea, whereas it is sometimes on the descending part of the curve for the cristæ. For the lateral line it is close to the top of the curve. The optimal 'amplification' (see above) is about 6 for the lateral line, between 3 and 8 for the cristæ and between 1 and 1 7 for the cochlea It is about 1 for less optimal values of the amplitudes of the two frequencies.

Though the experiment described here is very simple, we have not found any earlier report of it in the literature It proves that the sense organ gives a non-linear response, a good microphone should give a response similar to the input curve *c*. We have constructed electronic models giving the same typical response, and the possible relations between these models and physiological processes are being investigated. They will be published elsewhere in more detail, together with a full account of the experiments described here

Interpretation of Differential Thermal Curves of Mixed-layer Minerals of Illite and Montmorillonite

Mixed-layer minerals of illite and montmorillonite have been known for more than a decade now, and new examples are constantly being reported[1] The identification of these minerals is based largely on X-ray examination using the tables and curves of Brown and MacEwan[2] or the method of MacEwan[3] for random structures, the methods for ordered structures are more direct. Most workers publish differential thermal curves as supporting evidence for the presence of an interlayered structure, and in these curves there are usually two endothermic peaks in the region between 500° and 700° C, which are taken to represent loss of hydroxyl water from the separate illite and montmorillonite layers. However, a detailed examination of published and unpublished differential thermal curves of these materials shows that the sizes of the endothermic peaks in the 500°–700° C. region bear no relation to the proportion of illite to montmorillonite found by X-ray examination Order can be attained only by dividing the curves into two series, in one of which the main endothermic peak lies between 525° and 625° C. and in the other between 650° and 725° C. The curves in each series still bear no relation to the proportion of illite and montmorillonite, but there is an important structural difference between the groups not revealed by X-ray examination which appears to be of wide significance.

The subdivision requires the existence of anomalous illites[4] and montmorillonites[5] in which the temperatures of the endothermic peaks are reversed in the region between 500° and 700° C. Furthermore, it is logical to assume that these anomalous minerals have arisen owing to mineral transformations that have proceeded as in the following scheme (full lines).

Series I		Series II
'Illite'-like differential thermal curves		'Montmorillonite'-like differential thermal curves
Structure probably disordered		Structure probably ordered
	← – – –	
↓ Normal illite		Abnormal illite ↑
Intermediates		Intermediates
Abnormal montmorillonite		Normal montmorillonite
	– – – →	

If this thesis be correct, differential thermal analysis will indicate the direction in which mineral transformations are taking place in mixed-layer minerals of illite and montmorillonite; several examples have been put to test with success

Transformations between series I and II are possible but difficult, thus explaining why the second endothermic peak associated with the main one in the region 500°–700° C. in each series is usually poorly developed. It can be performed artificially for a normal montmorillonite by firing material to 800° C. and rehydrating the product in steam[6], whence abnormal montmorillonites are obtained. It should be noted that this is a disordering process and suggests the possibility that the structures of series I are disordered and those of series II ordered. Order–disorder can be of several types and need not be the same for artificially prepared abnormal montmorillonites as for naturally abnormal ones. That which is believed to be of importance for the latter is order–disorder of the substitution cations, which brings about differences in bonding of hydroxyls as indicated by Kerr *et al* [7].

On the present theory it would not be necessary for the abnormal montmorillonites recently described by Bose and Sengupta[5] to have iron contents intermediate between that of nontronite and normal montmorillonite to explain the lower differential thermal peak in the region 500°–700° C. Another naturally abnormal montmorillonite known to me has no iron at all, and the iron content of the sample used by Hill[6] could not have been changed during his experiments. Chemical data indicate also that current theories of the effect of substitution of silicon by aluminium in tetrahedral layers do not explain the thermal effects of anomalous illites and montmorillonites. A disorder–order process seems worthy of serious consideration and study

In the scheme suggested, a cycle of transformations is postulated, and this cycle should be reversible, but as yet no ways of performing the disorder–order transformation artificially have been found. However, this concept should enable one to plan experiments designed to transform illite and montmorillonite (normal forms) into each other more successfully than has been done in the past.

A more detailed account of these ideas is given in a chapter on clay mineral mixtures and mixed-layer minerals in the forthcoming monograph of the Mineralogical Society of Great Britain on "The Differential Thermal Investigation of Clays".

Anhydrous Hydrogen Fluoride as a Collagen Solvent

IT has been reported[1] that hide collagen and other proteins dissolve in anhydrous hydrogen fluoride The fact that some proteins, like insulin, were recovered with up to 80 per cent of their initial biological activity, after solution in this solvent, suggested that collagen might dissolve without denaturation. The ability to reconstitute characteristic collagen fibrils from solution was used as the criterion of the absence of denaturation

Dry, purified, unlimed, steer-hide collagen was introduced into the middle flask of a train of three polyethylene flasks. These flasks were connected to each other, to the hydrogen fluoride tank, and to a nitrogen tank by polyethylene and copper tubing to form a gas-tight apparatus. After introduction of the sample, the apparatus was flushed with dried nitrogen for 48 hr. Hydrogen fluoride was distilled from the tank into the nearest flask and then carefully redistilled into the flask containing the sample After eleven days at 0° C., some of the collagen had dissolved Using anhydrous conditions, some of the supernatant liquid was withdrawn into a fourth polyethylene flask The hydrogen fluoride was evaporated from the two flasks anhydrously and the residues examined

The residue from the supernatant liquid was a transparent film which gave a gelatin-like high-angle X-ray diffraction diagram. This dry film was soluble in water. A distilled water solution of this film produced precipitates when ammonium sulphate and phosphotungstic acid solutions were added These precipitates were examined in the electron microscope but nothing fibrous was observed.

The distilled water solution was further examined by dialysis against 1 per cent and 10 per cent solutions of sodium chloride, tap water and distilled water. Bovine glycoprotein was added to another portion, and this mixture was dialysed against distilled water[2]. Precipitates were not obtained in these reconstitution tests, and nothing fibrous was seen on electron microscopic examination

We conclude that anhydrous hydrogen fluoride does dissolve steer hide collagen, but that the solution occurs with denaturation

Reactions of Hyponitrites and Nitrites

EXPERIMENTS carried out by Oza and Oza[1] with silver and anhydrous strontium hyponitrites and dinitrogen tetroxide at 0°, 30° and 140° C show the production, in the gas, of both nitrous oxide and nitrogen, which are among the thermal decomposition products of these hyponitrites It appears, therefore, that these hyponitrites undergo fission into their normal decomposition products under the impact of the molecules of nitrogen tetroxide or dioxide The oxide and the nitrite so formed then react with the nitrogen tetroxide or dioxide to yield their relevant products of the reaction, while the gaseous products of the primary fission remain unaltered and their presence is shown by analysis of the gas.

It is known that sodium hyponitrite decomposes as follows.

$$3Na_2N_2O_2 = 2Na_2O + 2NaNO_2 + 2N_2$$

The hydrated salt produces some nitrous oxide also[1]. Thus the mere presence of water has the effect of converting some of the nitrogen into nitrous oxide. Calcium hyponitrite tetrahydrate, which normally decomposes into nitrite, nitrate, oxide, nitrous oxide, nitric oxide and nitrogen at 330°, is shown to decompose, yielding the same products, when kept for some time in the vicinity of 100° It appears, therefore, that the decomposition of hyponitrites can be induced by causes other than heat, for example, by molecular agitation of some kind. The hyponitrites of strontium, silver and mercury have also been systematically investigated by Oza and Thaker and found to yield similar products when decomposed by heat.

In another investigation silver oxide was isolated in the decomposition products of silver nitrite, although it had not been found by E. Divers[2]. The probable formation was indicated in a thesis mentioned in *British Chemical Abstracts* (1, 245 , 1942) , the details were not published and reference to the thesis shows that the oxide was isolated when silver nitrite was heated in a current of dry air at 550°, when the decomposition is extremely rapid His silver oxide may have been a secondary product , silver, in a finely divided state, can react with the oxygen of the air[3]. Oza, Oza and Thaker have isolated silver oxide in the decomposition of silver nitrite at 130° in an atmosphere of oxygen at 11 cm. mercury pressure. Addition of finely divided silver to the decomposing nitrite did not alter the results It is obvious that the atmosphere immediately in contact with the decomposing nitrite is a mixture of nitrogen dioxide and oxygen, which can produce only nitrate but not oxide. The presence of oxygen in the atmosphere surrounding the decomposing nitrite has the effect of removing nitric oxide, a product of the decomposition, which, if left as such, destroys the silver oxide

The action of nitric oxide on oxides of silver, mercurous and mercuric mercury, and calcium has been investigated by Oza and Thaker and Oza and Oza. The oxides were heated, at suitable temperatures ($< 300°$), for varying periods of time, in an atmosphere of nitric oxide at different pressures The experiments demonstrated the formation of nitrite as the primary product of the reaction. Nitrogen and nitrogen dioxide are produced in the gas and their formation is greatest when nitric oxide is at a pressure tending to zero There seems little doubt, therefore, that the molecule of nitric oxide decomposes and the nitrogen dioxide found in the gas arises in this way. The formation of nitrite may also involve a prior orientation of the nitric oxide molecule on the surface of the metal oxide to bring about what is essentially a peroxide structure[4] Nitrogen is also formed from nitric oxide in contact with nitrite[1]. In the case of silver oxide, which has, among the oxides now studied, the most readily detachable oxygen, this provides the most noteworthy reactions

A Simple Method for the Determination of Glycogen in Liver

THE methods used for the determination of liver glycogen can be divided into two general groups the glycogen can be determined in its original state[1,2], or after its hydrolysis to form simple sugars[3,4].

Recent investigations indicate that liver glycogen is built up of two physiologically different components. One of these is protein-bound, constant and can be extracted by boiling with alkali. The other is 'free', and physiological alterations are mainly associated with this fraction, which can be extracted with trichloracetic acid[2,5]. The latter method has been recently regarded by several authors as an accurate method for the determination of quantitativ changes in the liver glycogen[2,6,7].

On the basis of our experiments carried out during the past year, we recommend the following method for the determination of glycogen. We use 10 pe cent (v/w) trichloracetic acid, physiological salin and absolute alcohol. 2–3 gm. aliquots of the liver of rats killed by decapitation are quickly homogenized in a mortar previously weighed and containing 2 ml of trichloracetic acid. The weight o the liver sample is established by reweighing th mortar, and the quantity of trichloracetic acid mad up to 1 ml /gm liver To this 1 ml./gm liver mixture physiological saline is added and the homogenization completed. After filtration through filte paper, 1 5 ml. of alcohol is added to 1 2 ml. of th filtrate (In the case of high liver-glycogen concentrations, appropriate dilutions of the filtrate may be used) The turbidity arising on shaking and after standin for three hours is measured nephelometrically wit a yellow filter in a suitable colorimeter The origina (or the diluted) filtrate in a 1 2–1 5 dilution wit water serves as blank control

Calibration curves were established with dilution of a commercial sample of glycogen and with thre samples originating from different groups of rat liver The regressions of all the four samples proved to b identical. This shows a great advantage above th van der Vies iodine method[2], as with the latter eve livers of single animals of the same species gav different colour reactions. We have ourselves investigated the use of this method[8].

In recovery experiments, 103 6 ± 3 85 per cen of added glycogen was regained (average of nine determinations) The values obtained by our metho were compared with the values for the same live as determined by the hydrolytic method[3,9] Accordin to our experiments, in the case of low liver glycoge the relative proportion of trichloracetic acid glycoge proved to be low, whereas in the case of high live glycogen the two methods gave nearly the sam results. This observation is in accordance with th results of other authors[2,10].

Details of this work will be published in *Act Physiologica Acad. Sci. Hung*

In vitro Synthesis of Ribonucleic Acid in Reticulocytes

WE have been studying the concurrent synthes *in vitro* in rabbit reticulocytes of hæm, globin an the non-hæmoglobin proteins. Using methylen labelled (^{14}C) glycine the degree of ribonucleic ac synthesis also could be measured. The techniq devised may be useful to others faced with th problem of measuring the radioactivity of very small amounts of substances in very dilute solution It has enabled us to observe the synthesis of five nucleotide components of ribonucleic acid, beginning with 8 ml. of reticulocytes

Reticulocytes were produced in a rabbit by the injection of phenylhydrazine, these were washed free of plasma in Krebs solution by centrifugation, and then incubated for two hours at 37 5° under 95 per cent oxygen and 5 per cent carbon dioxide in a Krebs solution reaction mixture containing the following, which have been found to stimulate amino-acid incorporation into the proteins and hæm synthesis certain amino-acids, Fe^{++}, fructose-alanine, and plasma dialysate[1] At the end of the incubation, the cells were washed five times by suspension and centrifugation in a large volume of Krebs solution and then to the sedimented cells was added 100 ml of 7 per cent trichloracetic acid at 4° which dissolves all the free nucleotides The precipitate was dissolved in 1 *N* sodium hydroxide (0 25 ml per ml. of cells used) and allowed to stand overnight at room temperature The ribonucleic acid is thus hydrolysed to its nucleotides The deoxyribonucleic acid and proteins are precipitated from this solution by 7 per cent trichloracetic acid The supernatant solution is extracted with ether in order to remove the trichloracetic acid and then the Na^+ is removed from it by the addition of 20 mgm of 'Dowex-50' H^+[3] The nucleotides were then isolated by adsorption on, and serial elution from, 'Dowex-1' according to the procedure of Cohn[4] Cytidylic and adenylic acid *a* were eluted with 0 1 *M* formic acid, adenylic acid *b*, guanylic and uridylic acids by 1 0 *M* formic acid The fractionation was followed by measuring the light absorption at 260 mμ and the different nucleotides were identified by the ratio of optical densities at 260 and 280 mμ.

The following procedure was used for measuring the radioactivity of each nucleotide isolated as above 20 mgm. of 'Norit' was suspended in water and then spread evenly on a circle of filter paper, 20 mm diameter, by suction filtration through a sintered glass funnel with a removable collar. The solution containing the nucleotide was filtered through several times until no more nucleotide was removed. The amount of nucleotide adsorbed was determined by the diminution in optical density at 260 mμ in the filtrate, 20 mgm of 'Norit' retains about 1 mgm of nucleotide. For accurate measurement of the radioactivity the charcoal must be saturated with nucleotide, therefore the filtrate must finally contain some nucleotide which the charcoal does not remove. It was determined in separate experiments that no free glycine (^{14}C-labelled) was retained on the charcoal in this procedure, this eliminated any possible slight contamination of the 'Dowex-1' fractions by radioactive glycine The paper with the charcoal on it was then placed on a circular aluminium cup, spread with silicone grease to prevent curling of the paper, and dried Radioactivity was measured in a Geiger–Muller end-window counter, using glycine with 24 $\times 10^{6}$ counts per minute per millimole

The different nucleotides have the following specific activities

Nucleotides	Counts/minute per millimole
Adenylic acid *a*	2,620
Adenylic acid *b*	2,295
Guanylic acid	3,620
Cytidylic acid	1,135
Uridylic acid	515

This incorporation is about 1–6 per cent of the incorporation of glycine per residue of glycine in the globin.

Relation of the Ground Substance of the Central Nervous System to the Blood – Brain Barrier

Between the cell bodies, the neuroglial fibres, and the nerve processes of the central nervous system, there are spaces These spaces are filled with a ground substance of a carbohydrate – protein nature, revealed by staining with the periodic acid – Schiff reagents[1] The concept of a blood – brain barrier was formulated when it was discovered that intravenously administered trypan blue stains extensively other organs of the body, but does not stain the brain[2]. Numerous subsequent investigations have demonstrated that trypan blue, administered intravenously or intraperitoneally, is a valid test substance for the presence or absence of a blood – brain barrier[3].

Intravenous trypan blue does not stain the adult brain[2], indicating the presence of a blood – brain barrier. On the other hand, intravenous trypan blue stains the brain in several new-born animals, indicating the absence of such a barrier[4] The brain of the new-born mouse has not yet developed a blood – brain barrier and hence stains with trypan blue[5]. Periodic acid – Schiff staining of paraffin sections of the brains of neonatal mice reveals that the ground substance is not yet present in these forms The brain of the new-born guinea pig already has a blood – brain barrier[4] and, like the adult, does not stain with trypan blue[6] It has been shown that the ground substance of the guinea pig brain is present already in the fœtus at 45 days of gestation, and assumes proportions similar to the adult at 50 days gestation age[7]. Thus, the absence or presence of a blood – brain barrier as tested by the ability of the brains of animals to stain or not to stain with intravenous trypan blue appears to be related to the absence or presence of the ground substance of the central nervous system

To test this hypothesis further, experiments were performed on the brains of rats Hot-stab wounds of the brains of adult rats allow the brain to be stained by intraperitoneal trypan blue[8], thus implying a breakdown of the blood – brain barrier[3] The stain is most intense after operation and until three days after injury, after which it gradually fades and is essentially absent ten days after operation[8]. Stab wounds with a hot needle were made in the brains of adult rats After one to thirty days, the animals were killed and sections through the wound area were stained by the periodic acid – Schiff technique. After a stab wound of the brain, an extensive area of brain surrounding the wound is negative to the periodic acid – Schiff test. This condition lasts for three days After three days, the negative area around the wound begins to diminish in extent. This continues until ten days after the operation, by which time it has disappeared After such brain wounds, the ground substance disappears, begins to be re-elaborated starting at the third day, and gradually increases in amount until its regeneration is about complete by the tenth day. Thus after brain wounds, the breakdown and reconstitution of the blood – brain barrier, as tested by intraperitoneal trypan blue staining, conforms to the same schedule as the dissolution and re-elaboration of the ground substance

The site of the blood – brain barrier has been said to reside in the cerebral capillaries, in the capillary endothelium, or in the pia-glial membrane From the results of the present experiments, it seems that the ground substance of the central nervous system contributes to the blood – brain barrier and is a substance which prevents the staining of the adult normal brain by intravenous or intraperitoneal trypan blue.

These experiments will be reported in detail shortly. This investigation was supported in part by research grant B-341 from the Institute of Neurological Diseases and Blindness of the National Institutes of Health, U S Public Health Service.

Effect of Methylcholanthrene on Ovaries of Mice

ALTHOUGH a great deal of work has been done on the carcinogenic action of methylcholanthrene, its effects on specific organs and tissue systems have not been completely investigated Among the methods employed are skin-painting, subcutaneous injection, intra-peritoneal administration as well as injection into the amniotic fluid of mice. The findings reported here are based on observations by another method which has been employed as part of an investigation for determining the strain specificity of certain endocrine organs of mice of the C_{57} (black), the Strong A and the C_3H (Bar) strains of mice The results which were obtained are striking enough to deserve wider notice even at this stage

Female mice of the three strains about two months of age were operated upon under anæsthesia and the ovaries exposed. Each ovary was gently lifted up with a pair of forceps and painted with a 0 25 per-cent benzene solution of methylcholanthrene with a single stroke of a camel hair brush. The ovaries were then dropped back in place and the abdominal wound sutured up. When the sutures healed, the animals were kept for mating with their respective litter-mate males.

It has been observed that an over-all hæmorrhagic effect is seen in the young of all the strains and in particular the C_3H (Bar) strain Localized hæmorrhagic areas are seen in all and particularly in the C_{57} strain These areas are almost always on the upper lip, the back between the scapulæ, the shoulders, and the legs especially the digits. Blood clots have been observed in the C_{57} (black) and the Strong A strains These are at the tip of the nose, the chin, on the digits and in some cases at the second joint of the limbs. One or several may be present in a single animal. In the Strong A strain, one young with a club foot was observed. This animal lived to be eleven days old, at which time the mother destroyed it. Histological sections have shown that the hæmorrhage is not in any particular region but diffused throughout the connective tissue and muscles Table 1 gives a summary of the reactions seen in the different strains

From the observations available so far, it seems as though the ova of each strain respond differently to methylcholanthrene The effect on the C_{57} (black) seems to be most drastic, while in the Strong A it is least lethal On the C_3H Bar it appears to be intermediate in action It would seem as though the effect on the ova persists, for the reaction is obvious not only in the first litter but also in subsequent litters as well

When the investigations in progress are completed, full details will be published

This communication is published by permission of of Dr. V R. Khanolkar, director, Indian Cancer Research Centre, under whose guidance the work is being done

Table 1

Strain of mice	No of breeders	No of litters	No of young	Total No of young alive	Total No of young dead	Still-born young	Young with generalized hæmorrhage	Young with localized hæmorrhage	Young with blood clots
A (Strong)	4	11	62	40*	12	—	4	2	6
C_3H (Bar)	3	3	19	4	15	—	11	4	—
C_{57} (black)	4	8	40	3	37	5†	2	24	6

* One of these had a club foot
† All five belonged to the same litter The mother developed a uterine tumour

Morphine Antagonists

IN an earlier communication[1], we described the antagonistic action of tetrahydroaminacrin and 2-4 diamino 5 phenyl thiazole towards the depressant effects of morphine It was shown there that these antagonists did not affect the analgesic properties of morphine on rats

Since then we have had an opportunity of confirming this remarkable differential antagonism on human beings. Five patients suffering intolerable pain in the terminal stages of carcinoma were the subjects of this investigation. They had been receiving incomplete relief from up to 3 gr of morphine per day, given in divided doses at 2–4 hourly intervals. These patients were given as much as 1½ gr of morphine in one injection, and the severe respiratory depression and narcosis which followed were relieved by an injection of up to 40 mgm of 2-4 diamino 5 phenyl thiazole The analgesic effect of the morphine was, however, unaffected, and the patients remained free from pain for twelve hours and longer

The relief from the depressant effects of morphine was selectively graded. Respiratory depression was first relieved, followed by a lessening of the narcosis, as the dose of 2-4 diamino 5 phenyl thiazole was increased, large doses completely awakened the patient without lessening the analgesia, although the duration of relief was shortened

We have been able to observe the above response daily in two cases for a period of ten weeks and in a further two cases for a period of six weeks. During this period there was no evidence of the development of any tolerance, either to morphine or 2-4 diamino 5 phenyl thiazole

The thiazole derivative differed from N-allyl-*nor*-morphine in several respects. It did not provoke withdrawal symptoms in patients already receiving morphine and therefore is not a complete antagonist[2] It had no disagreeable side-effects when given alone in doses five to ten times the therapeutic, but individual variation should always be anticipated It does not antagonize the analgesic action of the morphine in therapeutic doses

Both compounds are antagonists of 'Pethidine', 'Amidone' and 'Omnipon'. The full results will be published in a clinical journal[3]

Size of the Myosin Molecule

At present considerable confusion exists concerning the size of the myosin molecule In a recent paper, Parrish and Mommaerts[1] reported a molecular weight of 650,000 and sedimentation-diffusion data which differ considerably from previous ones reported by various authors.

We would like to report briefly our findings, which set the molecular weight of myosin even lower than those of Parrish and Mommaerts. Using fresh myosin which had not been exposed to temperatures above 10° C. (see ref. 2), we find the diffusion coefficient $D_{20}^{w} = 1\ 0 \times 10^{-7}$ (measured at 1° C and extrapolated to zero concentration), in very good agreement with the value found by Parrish and Mommaerts[1], and considerably higher than those obtained by earlier workers. The sedimentation constant extrapolated to zero concentration and measured at approximately 4° C gives $S_{20}^{w} = 6\ 15 \times 10^{-13}$ (ref 3) This figure is in agreement with 6 20 obtained also at low temperature by Miller *et al*[4] Using a value of 0 728 for the partial specific volume[1], the molecular weight is calculated to be about 500,000

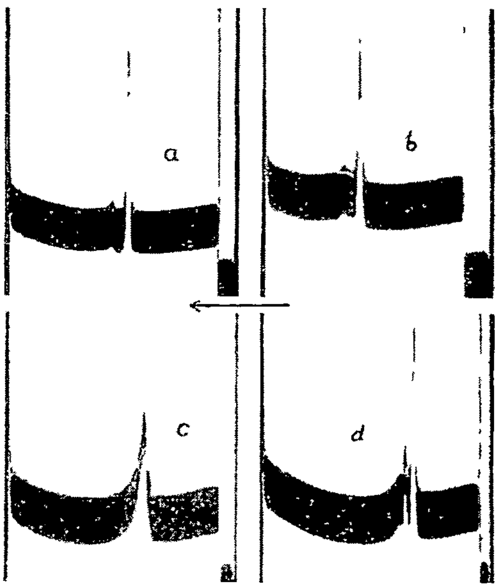

Fig 1 0 42 per cent myosin in 0 6 *M* potassium chloride, 0 005 *M* histidine buffer, *p*H 6 8, centrifuged at 59,780 r p m under different conditions (*a*) fresh myosin at 5 1° C , 129 min , *S*(*w*, 20) = 4 6 , (*b*) fresh myosin at 26 0° C , 81 min , *S*(*w*, 20) = 5 1 , (*c*) myosin incubated 2 hr at 25° C run at 28 7° C , 49 min , *S*(*w*, 20) = 8 2 , (*d*) myosin incubated 2 hr at 25° C , run at 9 0° C , 81 min , *S*(*w*, 20) = 4 8 The arrow shows the direction of sedimentation

In addition to confirming the observations of Mommaerts[1] and Blum and Morales[5] that the apparent sedimentation constant of myosin depends somewhat on temperature (see some of our results in Table 1), we found that more profound changes occur in the myosin molecule when left standing at temperatures of 25–30° C for several hours Fresh myosin centrifuged at 5° or 25° C shows a typical sharp sedimenting boundary with a sedimentation constant of about 5×10^{-13} (Fig. 1, *a* and *b*). If left standing at room temperature for two hours, the nature of the boundary changes and the sedimentation constant increases to $8\ 2 \times 10^{-13}$ (Fig 1, *c*). At this stage, however, the change is apparently reversible, for when centrifuged in the cold the more symmetrical sharp boundary reappears and $S = 4\ 8 \times 10^{-13}$ (Fig 1, *d*) Longer incubation apparently produces further and irreversible changes These changes in the hydrodynamic properties of myosin with temperature may be peculiar to myosin and related to its role as the contractile protein of muscle, but in any event they seem to be the explanation of the divergent values reported in the literature. Whether the change with increased temperature represents a change of shape or aggregation or both cannot yet be stated

Table 1 EFFECT OF TEMPERATURE ON APPARENT SEDIMENTATION CONSTANT OF MYOSIN

0 19 per cent myosin in 0 6 *M* potassium chloride

Temperature of run (av) (in ° C)	$S(w, 20) \times 10^{13}$
5 5	5 1
11 0	5 3
25 6	5 5

Since the changes can be expected to occur slowly even at low temperature, one suspects that the actual diffusion coefficient is probably higher than that we obtained, and, therefore, the figure of 500,000 may be considered too high.

Nevertheless, the molecular weight of myosin can be considered as established from the size determinations performed on the meromyosins—the split products of myosin. The meromyosins appear to be more stable than myosin and readily amenable to sedimentation and diffusion studies. Since we found that the amino-acid compositions of the meromyosins add up to myosin[6], the sum of the molecular weights of the meromyosins (two L- and one H-meromyosin) should give the molecular weight of myosin.

The diffusion coefficients and the sedimentation constants of the meromyosins have been carefully determined by A. G. Szent-Gyorgyi[7]. With these results and an assumed value of 0.748 for the specific volumes, the molecular weights of 96,000 (for L-meromyosin) and 232,000 (for H-meromyosin) were obtained. Gergely *et al.*[8] have published recently molecular weights of the same order of magnitude for the meromyosins obtained by chymotryptic digestion. The sum of the meromyosins (two L and one H) gives a molecular weight of 424,000 for myosin. This figure is about half that obtained by Weber and one-fourth of that obtained by Snellman. It is possible that the previous investigators were measuring the molecular weight of some stable step-wise aggregate of myosin probably isolated as such from the muscle tissue.

Visual Pigments and Vitamins A of the Clawed Toad, *Xenopus laevis*

DARTNALL[1] has recently reported extracting what he describes as a new visual pigment from the retina of the South African clawed toad, *Xenopus laevis*. It is a purple substance, which in Dartnall's preparations has an absorption maximum (λ_{max}) at 514–516 mμ. Its difference spectrum—the difference in absorption between it and the products of its bleaching—has λ_{max} 521 mμ at *p*H about 8.6. Dartnall argues, largely on the basis of analogies with the behaviour of other types of preparation, that the absorption maximum of the *Xenopus* pigment in reality lies at 519 mμ. I see no reason, however, for rejecting his measurements, which are as stated. They show the properties of the *Xenopus* pigment to be intermediate between those of rhodopsin and porphyropsin. The absorption spectrum of rhodopsin ordinarily has λ_{max} 500 ± 2 mμ, that of porphyropsin λ_{max} 522 ± 2 mμ[2]. The *Xenopus* pigment, with λ_{max} about 515 mμ, might on this basis consist of a mixture of about 70 per cent porphyropsin and 30 per cent rhodopsin. Its difference spectrum is similarly intermediate. λ_{max} of rhodopsin lies at about 500–502 mμ, that of porphyropsin at about 525–530 mμ in such mildly alkaline solutions as Dartnall employed; so that again the *Xenopus* pigment, with difference λ_{max} 521 mμ, appears to be a mixture of about two-thirds to four-fifths porphyropsin with one-third to one-fifth rhodopsin.

Such a mixture of pigments should be most easily analysed through the fact that, in retinæ exposed to light, rhodopsin bleaches to yield vitamin A_1, porphyropsin to yield vitamin A_2. The vitamins A are readily identified by the blue products which they form on mixing with antimony chloride reagent, possessing characteristic absorption bands, vitamin A_1 at about 620 mμ, vitamin A_2 at about 690 mμ.

Fig. 1 shows the absorption spectra of antimony chloride tests with extracts of *Xenopus* retinæ, pigment layers (pigment epithelia + choroids), and livers. Twelve male animals which had been kept without food for three weeks were dark-adapted, and the eyes removed under red light. The retinæ were separated from the pigment layers, and were bleached by exposure to moderate light for 1.5 hr. This treatment degrades the visual systems to the vitamins A. The retinæ and pigment layers were digested separately in 6 per cent potassium hydroxide in methanol. This mixture was diluted with water and extracted thoroughly with petroleum ether. The extracts, transferred to chloroform, were mixed with saturated antimony chloride in chloroform, in absorption cells already placed in a Cary recording spectrophotometer, and the absorption spectra of the resulting products were recorded immediately. These are shown in Fig. 1.

Livers from six toads were minced, ground with anhydrous sodium sulphate until powdery, and extracted with petroleum ether. The yellow extract was saponified in 6 per cent potassium hydroxide in methanol, and transferred to hexane. It contained a yellow carotenoid, epiphasic in partition between petroleum ether and 90 per cent methanol, and possessing absorption bands in hexane at 447.5 and 475 mμ. In these properties it resembles α-carotene (λ_{max} 447.5, 478 mμ). The liver extract also contained a mixture of vitamins A. It possessed an absorption band in the near ultra-violet at 333 mμ in chloroform (vitamin A_1, 328 mμ; A_2, 350 mμ), and yielded with antimony chloride the spectrum shown in Fig. 1, displaying the bands near 620 and 690 mμ characteristic of both vitamins.

Fig. 1 shows that the bleached *Xenopus* retina contains predominantly vitamin A_2. The same is true of the pigment layers. A broad elevation of spectrum in the region of 620 mμ in both cases represents a small admixture of vitamin A_1. The livers also contain both vitamins A, but in reverse proportions, vitamin A_1 predominating.

The proportions of vitamins A_1 and A_2 in such mixtures are readily assessed by solving the simultaneous equations

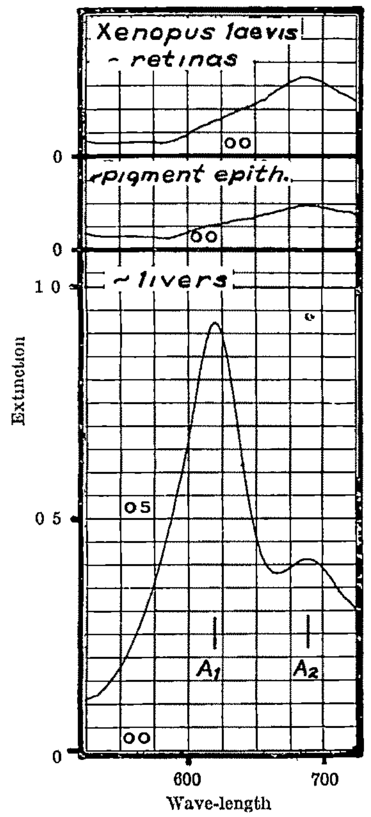

Fig 1 Absorption spectra of antimony chloride tests with saponified extracts of eye tissues and livers of the clawed toad, *Xenopus laevis* The spectra were recorded automatically, immediately after mixing the reagents An absorption maximum at about 620 mμ identifies vitamin A_1, one at about 690 mμ vitamin A_2 The spectra show that the bleached retina and the pigment layers—pigment epithelium and choroid—contain vitamin A_2 mixed with a little A_1, whereas the livers contain predominantly vitamin A_1

$$x = \frac{2\ 56\ k_{620} - k_{690}}{2\ 48};\quad y = k_{690} - 0\ 08\,x,$$

in which k_{620} and k_{690} are the extinctions measured at these wave-lengths, x is the extinction at 620 mμ specifically due to vitamin A_1, and y the extinction at 690 mμ specifically due to vitamin A_2 [3]. x and y can be converted into μgm /ml in the test solution by dividing x by 0 44 and y by 0 41 (since E (1 per cent, 1 cm) in the antimony chloride test is 4400 for vitamin A_1, and 4100 for A_2 [4]) In this way we find the proportions of the vitamins A in *Xenopus* tissues to be approximately as follows retinæ, $A_1/A_2 = 5/95$, pigment layers, $A_1/A_2 = 12/88$, livers, $A_1/A_2 = 68/32$ About 0 06 μgm of vitamin A_2 was obtained from each *Xenopus* retina, and about half as much from the pigment layers of each eye.

We may conclude that the principal visual pigment of the *Xenopus* retina is porphyropsin In our animals —judging from the amount of vitamin A_1 present—this seems to have been accompanied by a very small proportion of rhodopsin Dartnall's extracts, interpreted in these terms, appear to have contained a higher proportion of rhodopsin, owing possibly to his having fed his animals with raw liver, a material notoriously rich in vitamin A_1 The possibility must also be conceded, though a little unlikely, that λ_{max} for *Xenopus* porphyropsin lies at shorter wave-lengths than that for other porphyropsins so far investigated Even if it lay at the short wave-length limit for known porphyropsins, little discrepancy would remain between the proportions of rhodopsin and porphyropsin estimated on the basis of Dartnall's measurements and our own It should be added that if Dartnall is correct in his belief that the true λ_{max} of the *Xenopus* pigment lies at 519 mμ, no discrepancy at all remains between his measurements and ours

Dartnall tested his extracts for the presence of a mixture of pigments, by inquiring whether partial bleaching in various regions of the spectrum would produce differential effects He concluded that he had to deal with a single pigment To this it must be said, however, that he had over-estimated the differences to be expected, in the belief that the λ_{max} of porphyropsin is near 533 mμ, a belief based upon indirect considerations[5]. All direct measurements made so far upon adequate preparations of porphyropsin give λ_{max} at 522 ± 2 mμ (cf ref 6). The absorption spectra of rhodopsin and porphyropsin therefore overlap very widely, and only the most searching measurements would resolve such mixtures as here indicated It is possible that slight bleaching in red light as compared with white light would reveal a difference, unfortunately Dartnall, though he apparently made such measurements, has not shown the results in a form that permits accurate discrimination.

Xenopus is not the only animal that presents such a mixture of visual pigments and vitamins A in the eye and liver as we have described The anadromous sea lamprey, *Petromyzon*[7], and the anadromous chinook salmon and brook trout[3,8] present much the same pattern. I have found this distribution also among tailed Amphibia in the permanently larval mudpuppy, *Necturus*[9], and among tailless Amphibia in the tadpole of the bullfrog, *Rana catesbiana*, in which the distribution of visual pigments and vitamins A is almost identical with that in *Xenopus*[9].

Porphyropsin is associated characteristically with vertebrates which dwell in, or more specifically which originate in, fresh water. It is this association which we pursue through the anadromous lamprey, the freshwater fishes, the adult water-phase newt, and the larval amphibia already cited[9] The special significance, therefore, of Dartnall's observation is not the discovery of a new visual pigment, but the first demonstration of porphyropsin in an adult anuran It is particularly significant that this should involve *Xenopus*, a member of the peculiar group *Aglossa*, possessing neither tongue nor teeth, and a purely aquatic animal. Here, as in other examples, the genetic factors which govern the freshwater habit have brought the use of porphyropsin in their train

A New Structure observed in *Trypanosoma evansi* (Indian Strain)

Recent investigations show the existence of a new structure in the Indian strain of *Trypanosoma evansi*, the causal agent of the virulent disease 'surra' in domestic and other animals

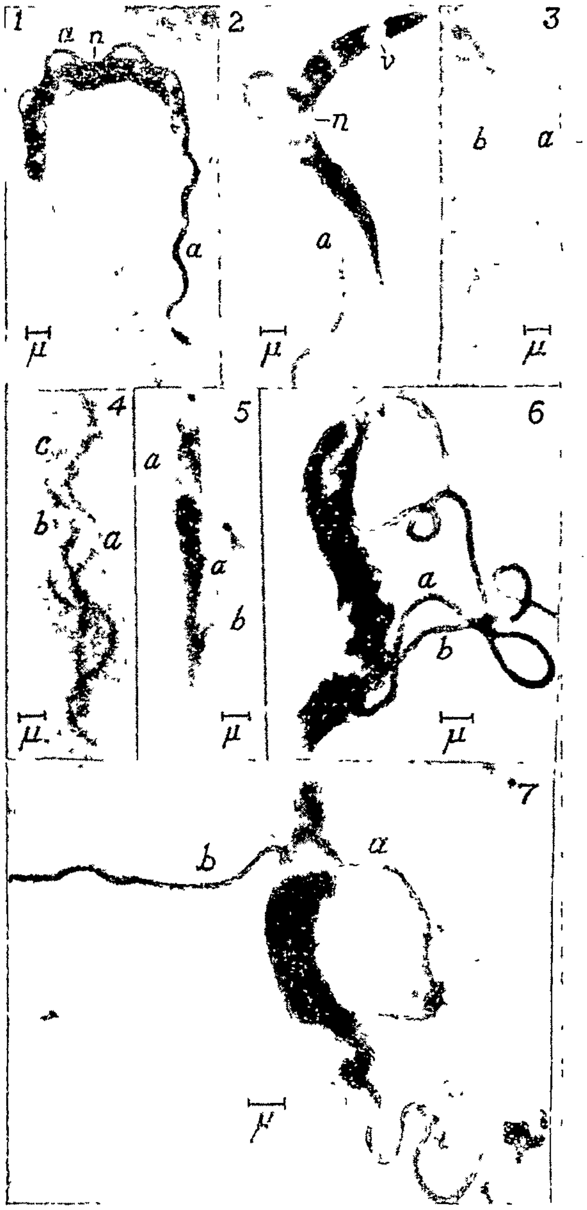
Trypanosoma evansi was maintained *in vivo* in white rats and transferred every few days whenever the infection was too heavy in one animal. These specimens after suitable treatment were studied with the light, phase-contrast and electron microscopes Stained films for photomicrography were made by making a smear of infected blood on a glass slide and staining with J S B [1] stain (Fig. 1). For phase-contrast microscopy, a drop of infected blood was mixed with physiological saline on a glass slide, a cover glass was superposed and pressed in order to produce a very thin film of suspension When the movement of the flagellates ceased, phase-contrast micrographs were made with a Spencer dark *M* phase objective (Fig. 2)

Trypanosomes are known to be uniflagellate organisms In the stained photomicrograph (Fig 1), the major part of the flagellum (*a*) is found to form the bordering filament of the undulating membrane, and only a small portion of this structure extends beyond the body as free flagellum This flagellum (*a*) is also clearly visible in the phase-contrast micrograph of the unstained parasites (Fig 2) In the latter the nuclear site (*n*) is seen to be lighter than the rest of the cell, with the exception of the vacuole (*v*) This shows that the nuclear site has a smaller optical path compared to the rest of the cell, a fact which has also been noticed in the case of *Leishmania donovani*[2]

For further detailed study, the trypanosomes were separated and concentrated from infected blood by centrifugation with normal saline The concentrated specimens were then treated in the following three methods. In the first method, a portion of the concentrate was suspended in distilled water for 30 min. at room temperature This water-treated material was then fixed in Schaudin's fluid, stained with Heidenhain's iron hæmatoxylin (long method) and then micrographed (Figs. 3, 4). A second part of the concentrate was crushed between two glass slides by the application of pressure and afterwards stained with J S B stain (Fig 5)

In Figs 3 and 4 showing specimens treated with distilled water, the whole of the protoplasmic material has disintegrated and a two-flagella structure is clearly visible (Fig 3, *a* and *b*) One of the flagella observed (*a*) is the usual flagellum which originates from the blepharoplast and is attached to the body surface (cf Figs 1 and 2) The second flagellum (*b*) is also found to originate from the region of the blepharoplast This possibly forms the inner border of the undulating membrane and is usually missed in the stained photomicrographs. This second structure (*b*) will be referred to as 'costa' in analogy with a similar organelle found at the base of the undulating membrane of trichomonad flagellates When the organism is in the dividing stage (Fig 4), in addition to the two flagella (*a* and *b*) already described a third one (*c*) is also noticeable. In the photomicrograph obtained from crushed and stained specimens (Fig 5) the two flagella (*a* and *b*) are again seen

A third part of the concentrated specimen was fixed in 1 per cent formalin for examination with the electron microscope The organisms were so dense, however, that no internal structure was visible In order to make the specimens more transparent to the electron beam, they were subjected to hydrolysis in N hydrochloric acid at 60° C, a treatment which has proved very suitable for the study of other protozoal organisms, namely, *Leishmania donovani*[2], and *Plasmodium burghei*[3]



Micrographs of *Trypanosoma evansi* under different conditions (*n*) Nucleus, (*v*) vacuole, (*a*) flagellum usually observed and (*b*) the second flagellum

Fig 1 Photomicrograph after J S B stain Fig 2 Dark phase-contrast micrograph of a living specimen showing that the nuclear site is lighter than the rest of the cell Fig 3 Specimen treated with distilled water, showing the common origin of the two flagella Fig 4 Specimen treated with distilled water in a dividing stage, in addition to the two flagella (*a*) and (*b*) a third one (*c*) is also noticeable Fig 5 A crushed specimen Figs 6 and 7 Electron micrographs Notice two flagella (*a*) and (*b*) originating from the same place and uneven electron scattering power in different parts of the cell

The electron micrographs of the hydrolysed specimens (Figs 6 and 7) again show the existence of the two flagella (*a* and *b*) Both flagella are found to originate from the same place, the longer one (*a*) forming the bordering flagellum of the undulating membrane is still intact in some parts in both figures. Close observation of Fig. 6 reveals the presence of fine fibrils attached to the surface of the two flagella. This is highly suggestive of the fraying of the protoplasmic sheath in the process of hydrolysis. However, during this work, the presence of fine fibrils composing the flagellum was not observed, as reported by Kraneveld *et al.*[4]

Thus the photomicrographs of water-treated and crushed specimens, as well as the electron micrographs of the hydrolysed specimens, definitely show that *Trypanosoma evansi* (Indian strain) possesses a structure at the inner border of the undulating membrane which can very well be compared with the 'costa' or basal fibre of the flagellates belonging to the family Trichomonadidae.

Life-cycle of *Porphyra capensis* Kutz.

ALTHOUGH germination of the spores of *Porphyra* has been observed under cultural conditions by a number of workers[1,2], the complete life-cycle of this plant, from the germination of the carpospore to the re-establishment of the leafy thallus, has never been conclusively demonstrated. The most recent work has been done with *P. umbilicalis* (L.) Kutz. by Drew[1,3], who has shown that the filaments produced by the carpospores of this species will penetrate shell and afterwards form growths which appear to be identical with those of *Conchocelis rosea* Batters[4]. Sporangia-like bodies (termed 'fertile cell rows' by Drew) developed in the cultures, but no spores were formed from these. Evidence of spore formation was obtained, however, from some similar growths occurring naturally in the scales of the barnacle *Pollicipes cornucopia* Leach[5].

No previous investigations have been carried out on the life-history of the South African species *Porphyra capensis* Kutz. In 1952, therefore, an attempt was made to germinate the carpospores of this species in culture. The spores were placed on glass slides and on pieces of egg shell, and in both cases growths were obtained which were similar to those recorded by Drew for *P. umbilicalis*[3]. Filaments from the spores placed on egg shell penetrated the shell and formed much-branched extensive growths, but the plants did not develop further. There was no convincing evidence of the formation of any bodies of a reproductive nature.

In February 1954, a further attempt was made. Development of filamentous growths from carpospores and their penetration of the shells proceeded as before, but this time a large number of sporangial structures were produced which closely resembled those described by Drew as 'fertile cell rows' (Fig. 1, *a*, *b*).

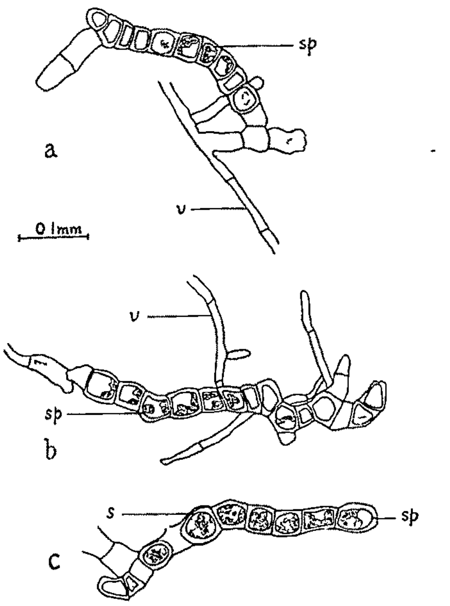

Fig. 1. Parts of plants of filamentous phase of *Porphyra capensis* Kutz. from the surface of egg shell 41 days after first emersion of the shell. Culture eight months old. (*a*) and (*b*), branched rows of sporangia (*sp*) and vegetative branches (*v*); (*c*) early stage in spore formation (*s*).

The cultures were maintained, and at the beginning of August a number of young leafy plants of the adult phase of *Porphyra* were seen to be growing attached to the bottom of the glass flask in which the shells were kept. Considerable care had been taken to keep these cultures free, so far as possible, from outside infection. The shells and apparatus employed were sterilized and only boiled, filtered sea-water was used. The cultures were aerated with air passed through a cotton-wool filter. The shells were periodically exposed to the air for periods of about an hour, so that to this extent the cultures were not under sterile conditions. However, it should be noted that leafy plants developed in the flask and not on the shells. Therefore, although the evidence was not conclusive, it would seem reasonably certain, in view of the precautions taken, that the young leafy plants had arisen from the filamentous plants growing in the same culture. Recently, in a second similar culture, germinating spores were observed in some of the sporangia, each sporangium producing one spore (Fig. 1 *c*). Other spores were observed to germinate after liberation from sporangia (Fig. 2).

Young leafy plants were produced, some of which were within, and others outside, the sporangia (Fig. 3). The leafy plants previously observed to be attached to the bottom of the flask were at a more

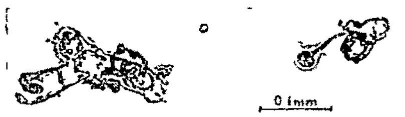

Fig. 2. Germinating spore of leafy phase of *Porphyra capensis* Kutz. Sporangia of filamentous phase can also be seen. Photographed in the living condition.

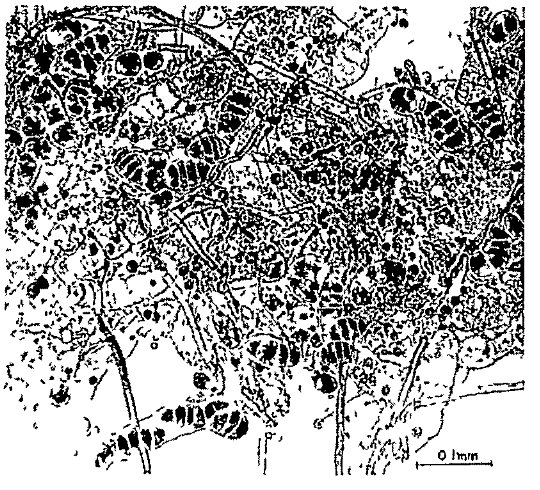

Fig 3 Parts of plants of filamentous phase of *Porphyra capensis* Kutz from the surface of egg shell, showing rows of sporangia and vegetative branches with spores and young plants of the leafy phase Photographed in the living condition

advanced stage of development than those shown in Fig. 3.

The exact mode of liberation of the spores is uncertain, although in some cases there is breakdown of the transverse walls between individual sporangia as described by Drew for the material from *Pollicipes cornucopia*[5].

A full account of this work is to be published later Thanks are due to the South African Council for Scientific and Industrial Research, the financial support of which has made possible the continuance of this investigation, and to Prof Wm. Edwyn Isaac for general guidance of the research

Positional Pseudo-Alleles in Diploid Potatoes

THE anthocyanins of diploid cultivated potatoes ($2n = 24$) are controlled by at least two independent loci of which one, P, is epistatic to the other R[1] Three closely linked loci, B, I and F, on another chromosome, are concerned with the distribution of pigment on the body of the plant. Locus I in its homozygous recessive phase ii is epistatic to the two colour loci and leads to the absence of pigment in the tuber, to which organ its main action is localized. Locus F governs the contrast between flecked and self-coloured flowers The former are homozygous recessives, ff, they are mainly white, but show dashes of colour on and around the vascular 'star' which is characteristic of the corolla Loci I and F have shown a recombination value of 1 98 ± 0 62 per cent

Seeds may be spotted owing to the presence of pigment on the cotyledonary node of the embryo and which shows through the testa On the haulm, opposite the axil of each leaf, there may be a nodal band of pigment on the abaxial surface. The floral abscission layer may be coloured with anthocyanin or green. In white tubers, the eyebrow may be coloured or uncoloured, but the difference is masked in self-coloured tubers Apparently these manifold expressions of the distribution of pigment may occur separately or together in nearly all combinations They are on homologous parts of the plant body and seem to be interpreted most satisfactorily by assuming a series of alleles, $B^d > B^c > B^b > B^a > b$, in order of dominance No estimate is given of the close linkage between loci B and I because satisfactory parents for the appropriate crosses are not yet available

Table 1 PHENOTYPIC EFFECTS OF ALLELES AT LOCUS B

Allele	Pigment			
	Spot on embryo	Nodal band	Floral abscission	Tuber eyebrow
b	−	−	−	−
B^a	−	−	+	−
B^b	−	−	+	+
B^c	+	−	+	+
B^d	+	+	+	+

$C\,P\,C$ 827[2] $\frac{B^c i F}{b\,I F}$ was crossed with $C\,P.C.$ 1776 $\frac{b i f}{b i f}$ and the expected two classes $\frac{B^c i F}{b i f}$ and $\frac{b I f}{b i f}$ were obtained In addition, two recombinants occurred. (*a*) $\frac{B^c i f}{b i f}$ and (*b*) $\frac{B^c I f}{b i f}$.

One of these, namely (*a*), a plant with white tubers and red eyebrows and flecked flowers, raised from a non-spotted seed, must have resulted from a crossover between loci I and F which, as mentioned above, have 1 68 ± 0 62 per cent recombination That this individual is heterozygous $B^c b$ may be inferred from the presence of a coloured eyebrow on the tuber.

The other recombinant, namely (*b*), is a plant with blue tubers and flecked flowers raised from a spotted seed That it is indeed heterozygous $B^c b$ and not a misclassified non-spot is shown by its breeding behaviour in a backcross to $C\,P\,C$ 1776 Expectation is a 1 3 ratio of spotted to non-spotted seeds, because the spotting effect of locus B is expressed only in the presence of allele P, for which $C\,P\,C$ 1766 is homozygous recessive. Out of 255 seeds, 60 had purple spots and 195 were without spots (χ^2 to a 1 3 ratio is 0 29 for 1 d f., $P = 0\ 60$).

The occurrence of recombinant (*b*) shows that the three loci are arranged in the chromosome in the sequence B—I—F

A notable feature of the recombinant $\frac{B^c I f}{b i f}$ is that nodal bands of pigment occur on the haulm opposite the axils of all leaves Thus it appears that when allele B^c is brought into contiguity with dominant allele I, the characteristic banding effect of allele B^d is developed (Table 1) Allele B^d occurs in only one clone of our collection, namely, $C\,P\,C.$ 2211, of which the genotype is $B^d I F$ Here also alleles B^d and dominant I are adjacent, and until they are separated by recombination it cannot be decided whether B^d is merely the compound $B^c I$ or an allele in its own right

This example is similar to those interactions in *Drosophila*[3] in which the heterozygotes represented as $+_1+_2/m_1m_2$ and $+_1m_2/m_1+_2$ (*m* designates the mutant form) are not equivalent in action. Like the A^b locus[4] in maize, physically distinct units function co-operatively in the determination of an effect.

The observation is of particular interest owing to the implication that the proximity of these loci concerned with distribution of pigment is not fortuitous.

A fuller account of this work will be published elsewhere with my colleague D. H. Long, who recorded this progeny at the Agricultural Research Council's Potato Genetics Research Station in Cambridge.

Hereditary (Seed-borne) Symbiosis in *Ardisia humilis* Vahl.

STEVENSON[1] recorded bacterial symbiosis in some New Zealand plants, Singh[2] noticed bacteria in stems, leaves and flowers of a number of angiospermic plants in South India, and Heimbeck[3] recently reported the occurrence of *L* forms of bacteria in wilting pea, which are filtrable through membranes that retain the smallest bacteria.

In *Ardisia humilis* (Myrsinaceae) growing in the Carmichael Medical College garden, schizogenous glands are found in leaves, stems, roots, floral envelopes (calyx and corolla), stamens, styles and in endosperms of seeds *B*. type *L* forms of bacteria are found in large numbers close to these glands, and a pinkish colour is very noticeable in young leaves (especially at their margins), sepals, petals, anthers, carpels and seeds Roots have conspicuous irregular nodular swellings due to infection by bacteria, and leaves, sepals and petals bear a large number of glands. The plants are perfectly healthy, they have grown for more than twenty years in the College garden and normally bear abundant lilac-coloured flowers and fruits. In fact, *B* type *L* forms of bacteria are found in every part of the plant, especially in growing regions and organs Bacteria were aseptically isolated from leaves and roots and were grown in pure culture in nutrient agar, malt-agar and in liquid malt, when a large number of *L* bodies similar to those photographed by Heimbeck (Fig Nos 7–11)[3] were found along with the bacteria in the form of small granules. The *L* forms were found to grow in small colonies without exuding mucilage or slime, their colonies forming each a dark central portion surrounded by lighter peripheral zone. Such forms are regarded by Klemeberger-Nobel[4] as forms intermediate between virus and bacteria.

Pohjakallio *et al* [5] remark that micro-organisms (in their case, one *Pseudomonas* sp) may antibiotically limit the damage caused by clover-rot fungus (*Sclerotinia trifoliorum* Erikss) to clover, *Trifolium pratense.*

The red colour from leaves, roots, anthers, etc , can be extracted easily with absolute alcohol. Absorption spectra of this colour and its chemical characters are being studied with the view of finding out if it contains hæmin and also if this colour is the metabolic product of *L* type organisms. The results of this study will be described in due course.

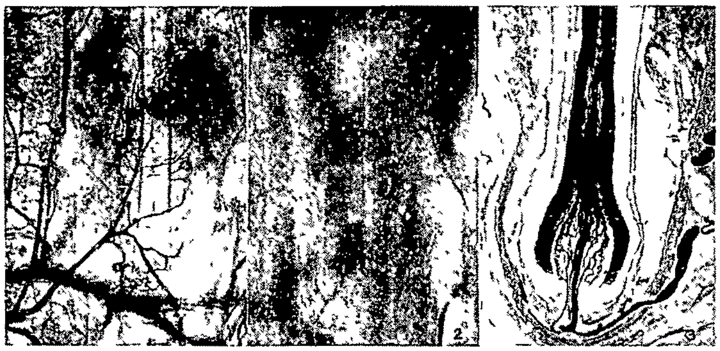
Blood Supply of Mystacial Vibrissæ

CURRENT interest in the blood supply to the skin and hair follicles of the sheep[1,2] prompts description of some recent investigations into the blood supply to the mystacial vibrissæ of the cat and rat. The animals were killed with ether and amyl nitrite, or intraperitoneal 'Nembutal', and a polythene cannula introduced into either the common carotid artery or jugular vein Blood was washed out with warm normal saline containing sodium nitrite or with 'Priscol', a sympathetic blocking agent. A warm 2 per cent aqueous solution of soluble Berlin-blue was the best of the injection masses used, due to its small particle-size and low viscosity. Techniques dependent on the presence of hæmoglobin did not reveal the fine vessels traversing the trabeculæ because they were obscured by blood in the sinuses, while constricted vessels empty of blood were overlooked

Observation on injected mystacial pads fixed either in 80 per cent alcohol and cleared by the method of Spalteholz, or in formal–saline and sectioned on the freezing microtome at 100–150 μ, show a main artery approaching the side of each follicle This gives branches to the striated muscles of adjacent follicles, and to a capillary plexus between the necks of the follicles, and then accompanies the sensory nerve passing through the outer dermal sheath at an angle of about 45° At the inner limit of the middle dermal sheath it divides into three branches (Fig. 1) The first, a fine vessel, turns sharply to the base of the follicle and contributes to a capillary network which extends to the hair matrix. A second, larger branch contributes to the capillary network of the middle region of the follicle, anastomosing with the first branch The third passing superficially gives rise to capillaries encircling the hyaline membrane reaching up to the deeper part of the ringwulst, from which region some of the injection mass could usually be seen escaping into the upper part of the cavernous sinus The injection mass never passed readily into the sinuses, which always contained blood even when an otherwise complete injection of the mystacial region had been accomplished

The efferent drainage of the follicle, the existence of which has not previously been reported, consists of a number of fine vessels (diameter *c* 4 μ) arising adjacent to the hyaline membrane and joining to form three principal vessels also of capillary dimensions (Fig 2). These unite and pass through the outer



(1) Artery supplying muscle, on left, before traversing outer dermal sheath into follicle, ringwulst and ring sinus above, main vein of region running deep, below Forward injection Rat, × 30

(2) Part of follicle showing fine efferent vessels Retrograde injection using 'Priscol' Rat, × 65

(3) Longitudinal section of base of follicle, afferent vessel to ascending papillary plexus on left, large efferent vessel on right Forward injection Frozen section Cat, × 30

dermal sheath in the deeper third of the follicle Immediately outside the sheath the efferent vessel enlarges (c 11 μ) and joins a vein into which the efferent vessel of the dermal papilla also drains.

The afferent vessel of the papilla derived from the arterial branch to the hair matrix is minute (c 5 μ), and gives rise to a network of capillaries covering the surface of the papilla, ascending to its apex in long twisting loops similar to those seen in dermal papillæ in other situations (Fig 3) The capillaries drain into a central efferent vessel of larger calibre (c 20 μ) which leaves the base of the follicle

The vascular pattern of the papilla is related, no doubt, to the high metabolic demand of an actively growing region In marked contrast, the relative dimensions of the afferent and efferent vessels to the sinus system suggest that blood is held in the sinuses under considerable pressure, providing a medium in which the hair and its root sheaths are suspended in a cradle of elastic strands, the trabeculæ This view is supported by experimental evidence which will be published at a later date.

Adult Behaviour-Pattern of *Anopheles gambiae* in Mauritius

SENIOR-WHITE[1] has suggested a most convenient system of classification for the adult behaviour of anopheline mosquitoes, especially the vectors of malaria. The classification is of considerable importance when assessing the vectorial capacity of *Anopheles gambiae*, which ought now to be regarded as a mosquito the behaviour of which is considerably plastic, it certainly is not "a vector wherever found" Under the environmental conditions of an oceanic island, such as Mauritius, *A gambiae* appears to lose its addiction for man It may be that when it first made its appearance in the island in the 1860's its full genetical complex was missing Again, there is a suggestion of a behaviour cline, *A gambiae* becoming less and less closely associated with man as its distribution recedes from the equatorial regions

Studies made since 1952 have shown that *A. gambiae* in Mauritius is strongly endophilic Only the unfed and unfertilized females are to be found resting out of doors. Male *A gambiae* are, however, strongly exophilic, and may be readily collected from rock crevices. Although it is so strongly endophilic, this is for cowsheds only It is most unusual to find resting individuals in houses Gebert[2] collected 46 from 12,561 houses, and Halcrow[3] found 6 unfed *A. gambiae* in 704 houses Precipitin tests have shown that the small number of the species that do feed on humans rest immediately afterwards in cowsheds It is suggested that Senior-White's classification of 'endophilic' should be subdivided into endophilic (houses) and endophilic (animal shelters), thus allowing for the unusual behaviour of the Mauritian *A gambiae*

Precipitin tests, based on 1,252 stomach smears of blood-fed *A. gambiae*, show a zoophilic index of more than 70 per cent, and an anthropophilic index of 2 8 per cent. Since 1,240 of the 1,252 smears were collected in cowsheds and from areas where herd cattle were absent and where the cattle were stalled in the cowsheds throughout the day and night, it would seem that a considerable degree of endophagy would be indicated Very few of the smears were negative for both cattle and man. As it is impossible to say whether the low number of blood-fed *A. gambiae* proved positive for humans obtained their blood meal in houses or in the open (the latter being more probable), a small degree of exophagism could be accorded to the species

The deviation of *A gambiae* into cowsheds might be explained by the great number of cowsheds in Mauritius. One-third of all buildings in Mauritius are cowsheds, in several villages within areas of prolific breeding of *A gambiae* the cowshed-to-house ratio is 1 1.

From observations made since 1952, it would seem that *A. gambiae* in Mauritius was, and is, a poor vector of malaria and bancroftian filariasis It is thought that the presence of *Anopheles funestus*, now eradicated, enhanced the low vectorial capacity of *A gambiae* by building up malaria to almost epidemic proportions In such an event *A. gambiae* would be more likely to become infected than at the present time, when the very low endemic malaria is dissipated by the deviation of this species to cattle

A summary of the adult behaviour pattern of *A. gambiae*, as it is found in Mauritius, is as follows almost completely endophilic (animal shelters), strongly endophagic and weakly exophagic This summary could be combined with other behaviour-pattern summaries from other geographical regions, and could form the basis for a study of a possible 'behaviour-cline' in *A. gambiae*.

Acknowledgment is made to the Colonial Insecticides Committee, which has financed this study.

UNIVERSITY OF LONDON (at King's College, Strand, London, W C 2), at 5 30 p m —Prof R M Titmuss "War and Social Policy" * (From a series of lectures on "War and Society")

INSTITUTE OF METALS, LONDON LOCAL SECTION (at 4 Grosvenor Gardens, London, S W 1), at 6 30 p m —Dr T G Pearson "Physical and Chemical Processes Occurring in the Electrolytic Production of Aluminium"

UNIVERSITY OF LONDON (at Wye College, Wye, near Ashford, Kent), at 8 15 p m —Dr H J Frankena (Wageningen) "Full Utilization of Pasture" *

Friday, March 4

SOCIETY FOR ANALYTICAL CHEMISTRY (at the Royal Society, Burlington House, Piccadilly, London, W 1), at 2 45 p m —Annual General Meeting Dr D W Kent-Jones—Address of the Retiring President

PHYSICAL SOCIETY, ACOUSTICS GROUP (in the Physics Department of Imperial College, Imperial Institute Road, London, S W 7), at 5 30 p m —Dr H Mol "Identification of Speech Sounds"

BRITISH SOCIETY FOR THE HISTORY OF SCIENCE, PHILOSOPHY OF SCIENCE GROUP—NORTHERN BRANCH (in the Medical Library The University, Sheffield), at 7 30 p m —Sir Ernest Finch "Leonardo da Vinci"

ROYAL INSTITUTION (at 21 Albemarle Street, London, W 1), at 9 p m —Sir Frederic Bartlett, F R S "Thinking—an Experimental Approach"

Saturday, March 5

LONDON COUNTY COUNCIL (at the Horniman Museum, London Road, Forest Hill, London, S E 23), at 3 30 p m —Dr Glyn E Daniel "The Megalith Builders" *

APPOINTMENTS VACANT

APPLICATIONS are invited for the following appointments on or before the dates mentioned

SENIOR LECTURER (with high academic and research qualifications, and able to teach to special (honours) degree standard) IN ORGANIC CHEMISTRY—The Clerk to the Governors, Woolwich Polytechnic, London, S E 18 (March 4)

LECTURER IN PHYSICAL CHEMISTRY at Wolverhampton and Staffordshire Technical College—The Clerk to the Joint Education Committee, Education Offices, North Street, Wolverhampton (March 5)

NON-MEDICAL BIOCHEMIST (Senior Grade)—The Secretary, General Hospital, Nottingham (March 5)

SENIOR LECTURER IN PHYSICS, a LECTURER IN PHYSICS, LECTURERS (3) IN MATHEMATICS, LECTURERS (2) IN GENERAL SCIENCE, and a LECTURER IN CHEMISTRY, at Kumasi College of Technology, Gold Coast—The Secretary, Advisory Committee on Colonial Colleges, 1 Gordon Square, London, W C 1 (March 7)

CHEMICAL ENGINEER (with a first- or second-class honours degree or equivalent qualification in chemical engineering) at a Ministry of Supply Establishment in S W England, for work which is concerned with the development of chemical processes involving semi-technical research, design and operation of pilot units and basic research in chemical engineering operations—The Ministry of Labour and National Service, Technical and Scientific Register (K), 26 King Street, London, S W 1, quoting F 60/5A (March 12)

PROFESSOR (able to pass an examination in Irish) OF MATHEMATICS —The Secretary, University College, Cork, Ireland (March 14)

ASSISTANT LECTURER (preferably with special qualifications in algebra and/or geometry) IN MATHEMATICS—The Secretary, Westfield College (University of London), Hampstead, London, N W 3 (March 15)

ASSISTANT LECTURER IN THEORETICAL PHYSICS—The Registrar The University, Manchester 13 (March 16)

ASSISTANTS IN RESEARCH (3) (with an honours degree in an appropriate subject) in agricultural engineering, animal physiology and soil science—The Secretary, School of Agriculture, Downing Street, Cambridge (March 16)

SCIENTIFIC OFFICER (with a good honours degree in science) IN THE FORAGE CROPS SECTION, to engage in genetical, physiological and breeding research in grasses and legumes—The Secretary, Plant Breeding Institute, Trumpington, Cambridge (March 16)

LECTURER IN VERTEBRATE ZOOLOGY—The Registrar, King's College, Strand, London, W C 2 (March 18)

SENIOR RESEARCH OFFICER or RESEARCH OFFICER (physicist or engineer) (with an honours degree in science or engineering, and preferably with industrial research experience) IN THE WOOL TEXTILE RESEARCH LABORATORIES, Geelong, Victoria, Australia, to carry out developmental work on wool textile machinery—The Chief Scientific Liaison Officer, Australian Scientific Liaison Office, Africa House, Kingsway, London, W C 2 (March 19)

MONSANTO RESEARCH SCHOLAR (with a degree in science or engineering) IN CHEMICAL ENGINEERING—The Registrar, New South Wales University of Technology, Broadway, Sydney, N S W, Australia (March 21)

RESEARCH FELLOW IN ELECTRON PHYSICS—The Registrar, The University, Edgbaston, Birmingham (March 26)

LECTURER IN APPLIED MATHEMATICS at St Salvator's College, St Andrews—Joint Clerk to the University Court, The University, St Andrews (March 31)

LECTURER IN APPLIED MATHEMATICS—The Secretary and Registrar, The University, Southampton (March 31)

PROFESSOR (with a higher degree and teaching experience at university level, and with substantial research experience in the field of mathematics) OF MATHEMATICS, at the University of Queensland, Australia—The Secretary, Association of Universities of the British Commonwealth, 5 Gordon Square, London, W C 1 (March 31)

CHAIR OF APPLIED MATHEMATICS—The Registrar, The University, Sheffield 10 (April 2)

SENIOR LECTURER IN LAND SURVEYING at the University of Cape Town, South Africa—The Secretary, Association of Universities of the British Commonwealth, 5 Gordon Square, London, W C 1 (Cape Town, April 15)

CHAIR OF SURGERY in the University of Cape Town—The Secretary, Association of Universities of the British Commonwealth, 5 Gordon Square, London, W C 1 (Cape Town, April 30)

ASSISTANT CONSERVATOR (with a degree in forestry, and preferably under 40 years of age) OF FORESTS, Cyprus—The Director of Recruitment, Colonial Office, Sanctuary Buildings, Great Smith Street, London, S W 1, quoting BCD 61/17/01

ASSISTANT LECTURER IN GEOLOGY—The Registrar, The University, Nottingham

BIOCHEMIST (non-medical, senior grade, and preferably with research experience) IN THE PATHOLOGICAL DEPARTMENT, for duties which consist of routine and more advanced biochemical techniques—The Consultant Pathologist, Hill End Hospital, St Albans, Herts

BRADFORD DYERS' ASSOCIATION LIMITED RESEARCH FELLOW (with high qualifications in science), to undertake research in tinctorial chemistry, textile chemistry or an allied subject—The Principal, Technical College, Bradford

ENTOMOLOGIST (preferably with postgraduate experience) IN THE RESEARCH SECTION of the Agricultural Department, Aden, to work on cotton and other crops—The Secretary, Empire Cotton Growing Corporation, 12 Chantrey House, Eccleston Street, London, S W 1

EXPERIMENTAL OFFICER (male) (with a degree or diploma in agriculture), AT THE SCOTTISH PLANT BREEDING STATION, to take charge of the organization and conduct of field work connected with the Station's scientific programme, and an ASSISTANT EXPERIMENTAL OFFICER (male) (with a degree or diploma in agriculture or botany) to assist in the Cereals Research Section—The Secretary, Scottish Plant Breeding Station, Pentlandfield, Roslin, Midlothian

EXPERIMENTAL OFFICERS (preferably with a pass degree), and ASSISTANT EXPERIMENTAL OFFICERS (with at least H S C), with the United Kingdom Atomic Energy Authority, Foulness, Essex, to assist in the development of electronic instruments to record air shock—Senior Recruitment Officer, Atomic Weapons Research Establishment, Aldermaston, Berks, quoting 215 A/WCE/2

FIELD GEOLOGISTS (with a first- or good second-class honours degree in geology) in the Geological Survey Departments of the following territories East Africa—Kenya and Tanganyika , Central Africa—Nyasaland, Northern Rhodesia , West Africa—Federation of Nigeria, Sierra Leone , South-East Asia—Federation of Malaya , Other Territories—Somaliland Protectorate, Bechuanaland, British Guiana—The Director of Recruitment, Colonial Office, Oversea Service Division, Sanctuary Buildings, Great Smith Street, London, S W 1, quoting BCD 104/04

LABORATORY TECHNICIAN (with experience in organic-chemistry research work) IN THE MICROBIOLOGY SECTION, for work on plant constituents—The Secretary, Department of Forestry, Imperial Forestry Institute, University of Oxford

LECTURER IN ASTRONOMY, and LECTURERS (2) IN RADIO ASTRONOMY—The Registrar, The University, Manchester 13

LECTURER (with a degree or diploma in agriculture and experience of teaching or lecturing) IN AGRICULTURE, at the Natural Resources School, Tengeru, Tanganyika—The Director of Recruitment, Colonial Office, Sanctuary Buildings, Great Smith Street, London, S W 1, quoting BCD/63/8/06

LECTURER (with special interests in either hydro- or aero-dynamics, or in electromagnetic theory) IN MATHEMATICS—Head of the Department of Mathematics, Imperial College, London, S W 7

MASTER to teach CHEMISTRY to scholarship level—Downside School, Stratton-on-the-Fosse, Bath, Somerset

ORGANIC MICRO ANALYST (Senior Technician grade) IN THE DEPARTMENT OF CHEMISTRY—The Chief Technician, Department of Chemistry, The University, Oxford Road, Manchester 13

PHYSICIST (with a good honours degree) to assist in research into the fundamental principles underlying the processing of textile fibres into yarns—The Secretary, British Jute Trade Research Association, Kinnoull Road, Kingsway West, Dundee

PLANT PHYSIOLOGIST (with, or expect to be awarded this year, a degree in natural science and training in plant physiology), at the Coffee Research Station, Ruiru, Kenya, to investigate diseases of the coffee berry—The Director of Recruitment, Colonial Office, Sanctuary Buildings, Great Smith Street, London, S W 1, quoting BCD 63/7/015

READER and SENIOR LECTURERS or LECTURERS IN PHYSICS—The Dean, College of Arts and Science, Baghdad, Iraq

RESEARCH ASSISTANT (with qualifications in mathematics, physics or chemistry) IN THE DEPARTMENT OF INORGANIC AND STRUCTURAL CHEMISTRY—Prof E G Cox, Department of Inorganic or Structural Chemistry, The University, Leeds 2

RESEARCH FELLOW IN THE DEPARTMENT OF CHEMISTRY, for work on the mechanisms of changes produced in polymers by radiations—The Registrar, The University, Edgbaston, Birmingham 15

SCIENTIFIC ASSISTANT FOR GREENHOUSE EXPERIMENTS, to take charge of the experimental work with sand and water cultures in connexion with investigations on the mineral nutrition of fruit crops—The Secretary, University of Bristol, Department of Agriculture and Horticulture, Research Station, Long Ashton, Bristol

SCIENTIFIC OFFICER or SENIOR SCIENTIFIC OFFICER (with a first-class honours degree in a natural science, and at least two years postgraduate research experience, preferably of freshwater fish and fisheries) at the Jinja (Uganda) Laboratories of the East African Fisheries Research Organization, to carry out research into the ecology and/or physiology of fish—The Director of Recruitment, Colonial Office, Sanctuary Buildings, Great Smith Street, London, S W 1, quoting BCD 195/194/02

TECHNICIAN IN THE DEPARTMENT OF CHEMICAL ENGINEERING, to assist in the preparation of Co enzyme "A"—The Secretary, University College, Gower Street, London, W C 1, quoting "Chem Eng /3"

The Policy for Education

provides a means of saving for a child's education For example, for a parent aged 35 next birthday,

The Society pays

£100 p.a. for 5 years, beginning in 15 years' time, and if the parent dies within 15 years, £100 p.a in the meantime towards the child's maintenance

The cost is

£8 7s. 6d. a quarter for 15 years at most

Enquire for details, giving the ages of parent and child

LECTURES AND COURSES

UNIVERSITY OF BIRMINGHAM

INSTITUTE FOR ENGINEERING PRODUCTION

EXECUTIVE COURSES ON PRODUCTIVITY STUDIES

A number of short practical courses on the principles and methods of increasing productivity are now available for production directors, works managers and senior production engineers on the following subjects

February 28 to March 11, "Work Study Applied to Secure Process and Product Improvement"

March 14 to March 25, "The Use of Operational Research in Increasing Productivity"

March 28 to April 7, "The Application of Work Study"

April 18 to 29, "Production Planning and Control"

May 2 to 13, "Work Study Applied to Secure Process and Product Improvement"

May 16 to 27, "The Use of Operational Research in Increasing Productivity"

June 6 to 17, SUMMER COURSE, on "Work Study with particular reference to Industrial Training Methods"

June 20 to July 1, SUMMER COURSE on "The Application of Work Study"

These courses may be attended singly or in sequence, and residential facilities are available for 25 members on each course Further information is available from The Senior Courses Secretary The Institute for Engineering Production, "Southfield," 16 Norfolk Road, Edgbaston, Birmingham, 15 Tel No EDG 0390

UNIVERSITY OF LONDON

A course of two lectures on "Some Infertility Factors in Domestic Animals" will be given by Professor Nils Lagerlof (Royal Veterinary College of Sweden) at 4 p m, on March 3 and 4 at the Royal Veterinary College, Royal College Street, N W 1

Admission free, without ticket

JAMES HENDERSON,
Academic Registrar

UNIVERSITY OF LONDON

A course of two lectures on "Mechano-Chemistry of Muscle" will be given by Academician W A Engelhardt (Moscow) at 5 30 p m, on March 8 and 16 at Westminster Medical School (Meyerstein Lecture Theatre), Horseferry Road, S W 1

Admission free, without ticket

JAMES HENDERSON,
Academic Registrar

UNIVERSITY OF LONDON

A lecture on "Full Utilization of Pasture" will be given by Dr H J Frankena (Inspector of Agriculture, Wageningen, Netherlands), at 8 15 p m on March 3 at Wye College, Wye, near Ashford, Kent

Admission free, without ticket

JAMES HENDERSON,
Academic Registrar

OFFICIAL APPOINTMENTS

The engagement of persons answering these advertisements must be made through a Local Office of the Ministry of Labour or a Scheduled Employment Agency if the applicant is a man aged* 18 *to* 64 *inclusive, or a woman aged* 18 *to* 59 *inclusive, unless he or she, or the employment is excepted from the provisions of the Notification of Vacancies Order 1952

KUMASI COLLEGE OF TECHNOLOGY

(Principal W E Duncanson, Ph D, D Sc, F Inst P)

Vacancies exist for (1) Senior Lecturer in Physics (2) Lecturer in Physics (3) Three Lecturers in Mathematics (4) Two Lecturers in General Science (5) Lecturer in Chemistry (6) Lecturer in English Salary scales Senior Lecturer, £1 400 to £1,850 per annum, Lecturer £880 to £1,560 per annum Initial salary according to experience Posts are pensionable but temporary appointments carrying gratuities and 10 per cent higher salaries might be made Partly furnished houses provided rent according to salary Free first-class passages to and from Gold Coast for persons appointed wives and up to three children under 13 Generous home leave, normally annual

Write for further information to Secretary, Advisory Committee on Colonial Colleges, 1 Gordon Square, London, W C 1 Closing date for applications (six copies) March 7, 1955

COMMONWEALTH of AUSTRALIA

DIVISION OF RADIOPHYSICS

APPOINTMENT NOS 780/111 to 780/113 OF RESEARCH OFFICER

The Commonwealth Scientific and Industrial Research Organization invites applications for research appointments to the Division of Radiophysics, which is located within the grounds of Sydney University The Division has a modern and well equipped laboratory and has vacancies in three recently developed fields of research Radio Astronomy, a modern branch of astronomy which is concerned with the study of extra-terrestrial bodies by means of the radio radiation which they emit, Rain and Cloud Physics, an investigation of the physical processes which lead to cloud and rain, both natural and artificially induced, the physics of Semiconductors and in particular of Transistors, and their applications in electronics Applicants should possess a university honours degree with physics as major subject and mathematics to a high standard A good knowledge of modern electronic techniques would be a desirable but by no means essential advantage Applications from recent graduates and from physicists with postgraduate research experience will be considered Appointment will be made within the classification of Research Officer (salary range £A 1 184 to £A 1,730 per annum), and at a level depending on previous training and experience Those selected will be offered, according to their qualifications and experience, either (i) A short-term appointment (two to three years), with the possibility of further extension, or (ii) a more permanent appointment to the research staff The appointments will be conditional on a satisfactory medical examination and officers appointed under (ii) may be granted superannuation privileges Fares to Australia (including those of wife and family) will be paid Position 780/111—for work on radio astronomy Position 780/112—for work on cloud and rain physics Position 780/113—for work on transistors

Applications, referring to the appropriate appointment number and stating full name, date and year of birth, marital state, nationality, present employment, particulars of qualifications and experience, and of war service, if any, accompanied by names and addresses of two persons willing to act as referees, if required, and copies of not more than four testimonials, should reach the undersigned, not later than March 26 1955

W IVES,
Chief Scientific Liaison Officer

Australian Scientific Liaison Office,
Africa House,
Kingsway, London, W C 2

UNITED BIRMINGHAM HOSPITALS

QUEEN ELIZABETH HOSPITAL, BIRMINGHAM, 15

Applications are invited from graduates in Biochemistry or Chemistry for the post of Biochemist (basic grade) in the Biochemical Laboratory Salary and superannuation according to National Health Service Whitley Council Scale

Applications, together with two testimonials, should be sent to the House Governor

---

CENTRAL RESEARCH ESTABLISHMENT National Coal Board (at Isleworth, Middlesex) invite applications for superannuable appointments as Scientists and Engineers Candidates should have a degree in physics, metallurgy, mechanical or electrical engineering or equivalent professional qualification, and preferably some experience in research The work embraces (a) the mechanical properties of coal, (b) technical processes of winning coal from the seam, (c) behaviour of the surrounding strata during and after removal of coal from the seam, (d) design of experimental coal-winning machinery embodying new principles, (e) the transport of coal underground by belt conveyors, (f) metallurgical problems arising in mining, (g) environmental problems—(i) temperature and humidity conditions underground (ii) the instrumentation of methane, (iii) the assessment and suppression of dust, (h) development of mechanical, electrical and electronic instruments for use in laboratory and underground Much of this work will be carried out initially in the laboratory, although staff will be required to continue their experiments underground when required Salary on appointment according to age and experience, will be in the Scientist Grade III scale £500 by £25 to £950 male, plus London location allowance of £34 minimum, rising to £66 at maximum scale—Write, giving full particulars (in chronological order) of age education, qualifications and experience (with dates), to National Coal Board, Establishments (Personnel), Hobart House, Grosvenor Place, London, S W 1, marking envelope TT/929 Original testimonials should not be forwarded Closing date March 29, 1955

GOVERNMENT OF NORTHERN IRELAND

CIVIL SERVICE COMMISSION

Applications are invited for a permanent an pensionable post of Scientific Officer in the De partment of Industrial and Forensic Science of th Ministry of Commerce The salary scale, whic attracts pay supplement of amounts betwee £22 10s and £30 per annum, is, for men, £470 b £30 to £680 by £35 to £855, and for women £47 by £25 to £545 by £30 to £750 Candidate should have a first- or second-class honours degre in an approved scientific subject or other approve equivalent qualification Previous industrial e perience will be an advantage Preference will b given to suitably qualified ex-Service candidat who served in the 1914-18 or 1939-45 wars, pro vided the Commissioners are satisfied that suc candidates are, or within a reasonable time w be, able to discharge the duties of the po efficiently

Application forms and further particulars ma be obtained from the Secretary, Civil Servi Commission, Stormont, Belfast, to whom th should be returned, duly completed, with copi of two recent testimonials, so as to reach him n later than April 1, 1955

UNIVERSITY OF LIVERPOOL

Applications are invited for the following Fe lowships (i) I C I Research Fellowships Physics, Chemistry, Engineering, Metallurgy a Pharmacology, or any related subject, to whi some appointments may be made during the cu rent academic year The appointments will da from October 1, 1955 The salary will depe upon qualifications and experience, but will no mally be within the range £600 to £900 per annu together with F S S U benefits and family allo ances (ii) Two Leverhulme Postgraduate Fe lowships in the Faculty of Science, tenable f one year at a value of £500, renewable for second year at a value of £550

Applications, three copies, stating the Fello ship applied for, age details of qualifications a experience, publications, research work in progre and completed, and an outline of the propos field of research, and, in the case of the Leve hulme Fellowships, whether National Service r quirements have been fulfilled, together with t names of two referees, should be received n later than March 1, 1955, by the undersigne from whom further particulars may be obtaine (Candidates overseas who find it more convenie to do so may send one copy only by airmail)

STANLEY DUMBELL,
Registrar

MONMOUTHSHIRE EDUCATION COMMITTEE

THE TECHNICAL COLLEGE OF MONMOUTHSHIRE, CRUMLIN

Dr T V Starkey Principal

Required on April 1 or as soon as possi thereafter (a) Lecturer in Chemistry Candida must possess a good honours degree or Associa ship of the Royal Institute of Chemistry and ha had research and/or industrial experience Tea ing experience would be an added qualificati The post involves the teaching of chemistry graduate level (b) Lecturer in Physics Can dates must possess a good honours degree Associateship of the Institute of Physics and ha had research and/or industrial experience Tea ing experience would be an added qualificati The post involves the teaching of pure and appl physics to graduate level In both posts resea is regarded as an official duty The salary to paid for each post will be at the Lecturer Gra of the Burnham Report (£965 by £25 to £1,06

Further particulars and forms of application tainable from the undersigned, must be return by March 12, 1955

C E GITTINS
Director of Educati

County Hall,
Newport, Mon

BATTERSEA POLYTECHNIC

LONDON, S W 11

Applications are invited for a Grade B Lectu to teach Science as applied to Catering and all subjects Applicants should be graduates of British university with chemistry as one of th subjects and a knowledge of nutrition or hyg would be an advantage Salary, men £621 £633 by £25 to £928 women £559 or £571 by to £763, plus allowance of £30 and £24 resp tively for a good honours degree, a training all ance and increments for industrial or research perience

Further particulars from the Clerk to Governing Body, by whom applications should received as soon as possible

COMMONWEALTH of AUSTRALIA

DIVISION OF BUILDING RESEARCH
APPOINTMENT NO 390/209 OF RESEARCH OFFICER

The Commonwealth Scientific and Industrial Research Organization invites applications for appointment to a position of Research Officer at its Division of Building Research, Highett, Victoria Duties to participate in a programme of theoretical and experimental research on the properties and uses of lightweight concrete and gypsum plaster as structural materials Qualifications University honours degree in engineering or science or equivalent qualifications Salary Dependent on qualifications and experience commencing salary will be determined within the range of Research Officer, £A 1,184 to £A 1,730 per annum actual, thirteen increments with efficiency review at £A 1,268 to £A 1,520 per annum actual Fare to Australia (including those of wife and family) will be paid The appointment is subject to satisfactory medical examination and the appointee may be granted superannuation privileges

Applications, referring to Appointment No 390/209 and stating full name place, date and year of birth, marital state, nationality, present employment particulars of qualifications and experience, and of war service (if any), accompanied by copies of not more than four testimonials and the names and addresses of two persons willing to act as referees, if so required, should reach the undersigned not later than March 26, 1955

W IVES,
Chief Scientific Liaison Officer
Australian Scientific Liaison Office,
Africa House,
Kingsway, London, W C 2

CITY OF CARDIFF EDUCATION COMMITTEE

COLLEGE OF TECHNOLOGY AND COMMERCE

Applications are invited for the post of Assistant Lecturer Grade B in the Department of Applied Physics and Electrical Engineering Candidates should have a good honours degree in physics or electrical engineering Some research, industrial or teaching experience is essential A knowledge of telecommunications would be an advantage The present salary scale for an Assistant Lecturer Grade B is £525 by £25 to £820 per annum, plus appropriate allowances for training and degree Applicants with suitable professional or industrial experience (after the age of 21) may be started higher up the scale at the rate of one increment of £18 for each year of such experience

Forms of application, together with further particulars may be obtained from the undersigned on eceipt of a stamped addressed foolscap envelope, and should be returned as soon as possible

Required for September 1, 1955 Lecturer Engineering (preference will be given to appliants with experience in soil mechanics and geology) Assistant Lecturers Grade B Electrical ngineering, mechanical engineering, structural ngineering, mathematics Assistant Lecturer Grade A Mechanical engineering, mathematics, physics Salary Burnham Technical Scale Lecturer £965 by £25 to £1 065 , Assistants Grade B, 525 by £25 to £820 , Assistants Grade A £450 by £18 to £725 (together with usual allowances or degree, training and industrial experience in ase of Assistants)

Forms and particulars obtainable from Director of Education Woodlands Road, Middlesbrough o whom completed applications should be reurned within fourteen days of the appearance of his advertisement

---

UNIVERSITY COLLEGE LONDON (GOWER treet, W C 1) requires full-time Research Assistant (man or woman) in Department of Anatomy Professor J Z Young), for work mainly on the central nervous system Duties to commence May 1, 1955 or as soon as possible thereafter reference to candidates with honours degree in medical sciences or biology , knowledge of German desirable Salary £600 per annum, with amily allowances —Applications, to be received by March 26 1955, should be sent to the Secretary, from whom further particulars may be obtained

---

PLANT BREEDING INSTITUTE

CAMBRIDGE

Applications are invited for the post of Scientific Officer in the Forage Crops Section to engage in genetical, physiological and breeding research in grasses and legumes Good honours degree in science essential Starting salary within range of £467 10s to £845 per annum, with F S S U benefits

Applications, with names of three referees, to be sent to the Secretary, Plant Breeding Institute, Trumpington, Cambridge, before March 16

COUNTY OF LEICESTER

LOUGHBOROUGH COLLEGE OF FURTHER EDUCATION

Applications are invited for an Assistant to teach physics to advanced level G C.E , and engineering physics to the requirements of the I E E , and to take up duties on, or before, September 1, 1955 Ability to teach chemistry to G C E ordinary level and to supervise the equipping and maintenance of science laboratories would be advantages Salary is in accordance with the Burnham Technical Scale, Grade B viz , £525 by £25 to £820, with appropriate allowances for degree, training, teaching and industrial experience

Further particulars and application form, which is to be completed within fourteen days of this advertisement, can be obtained from the undersigned

D J LYSAGHT, M Sc , Ph D ,
Principal
Loughborough College of Further Education
Loughborough

UNIVERSITY OF CAMBRIDGE

Applications are invited for a University Demonstratorship in Veterinary Anatomy The person appointed will be expected to take office from October 1, 1955 An honours degree in some branch of natural science is essential A veterinary qualification and experience in teaching the subject will be considered an advantage

Full particulars can be obtained from Dr A S Watt, Botany Department, Downing Street, Cambridge, to whom applications (ten copies), and the names and addresses of not more than three referees should be sent, to reach him not later than April 1, 1955

UNIVERSITY OF SHEFFIELD

Applications are invited for the post of Lecturer in Refractory Materials in the Department of Metallurgy, to begin duties as soon as possible Salary scale £650 by £50 to £1,350, with F S S U provision and family allowance Initial salary according to qualifications and experience

Further particulars should be obtained from the Registrar to whom applications (four copies) should be sent by March 31, 1955

UNIVERSITY OF GLASGOW

LECTURESHIP IN CHEMISTRY (ORGANIC CHEMISTRY)

Applications are invited for a Lectureship in Chemistry (Organic Chemistry), tenable from October 1, 1955 Salary scale £650 to £1,350 Initial salary according to experience and qualifications F S S U and family allowance benefits

Applications (six copies), should be lodged not later than March 12 1955 with the undersigned, from whom further particulars may be obtained

ROBT T HUTCHESON
Secretary of University Court

PHYSICISTS REQUIRED BY MINISTRY OF Supply for Research and Development Establishments mainly in Southern England Should have sound basic training in physics and be prepared to apply their knowledge to problems in fields including aircraft, instrumentation and electronics Prospects of promotion to higher grades Not established but opportunities to compete for establishment may arise Qualifications Scientific Officer Class, first- or second-class honours degree or equivalent Experimental Officer Class higher school certificate (science) or equivalent, but higher national certificate pass degree, etc , may be an advantage Salary, according to age, research experience, etc , as Scientific Officer, within range £467 10s to £845 , Experimental Officer (minimum age 26), £715 to £880 , Assistant Experimental Officer, £288 10s (age 18) to £640 Women somewhat less F S S U benefits may be available for Scientific Officer class —Application forms from Ministry of Labour and National Service, Technical and Scientific Register (K), 26 King Street, London, S W 1, quoting A34/5A

COMMONWEALTH of AUSTRALIA

DEPARTMENT OF HEALTH

Senior Research Officer, Plant Quarantine Section, Canberra Salary £A 1,394 to £A 1,646 per annum Duties Research and investigation into matters affecting plant quarantine involving liaison and co-operation with appropriate Institutions and technical workers in Australia Collection of technical data relating to plant quarantine administration Qualifications University degree in agricultural science or science of an Australian University, or of an overseas university of equivalent standing , or equivalent qualifications which should include a university degree supported by special postgraduate experience in research and/or teaching in plant pathology A sound general knowledge of agriculture, postgraduate research, and/or teaching in plant pathology, experience in conference work and in co-operation with other technical experts are desirable

Applications to The Chief Commonwealth Medical Officer, Australia House, London, W C 2, by March 19, 1955

MEDICAL RESEARCH COUNCIL

Applications are invited for the post of Research Assistant in the Climatic and Working Efficiency Unit of the Medical Research Council at the Department of Human Anatomy in the University of Oxford, to take part in fundamental studies of muscle and joint action and the application of this to clinical, industrial and service problems Candidates should have a medical degree or an honours degree in physiology or zoology The salary will be dependent on qualifications and experience Superannuation provision will be made under the Federated Superannuation System for Universities

Applications, giving age, qualifications, experience list of published work and copies of testimonials, should reach Professor Sir Wilfrid Le Gros Clark, F R S , Department of Human Anatomy, University Museum, Oxford, not later than April 30, 1955

CENTRAL RESEARCH ESTABLISHMENT, National Coal Board (at Isleworth, Middlesex) invite applications for the superannuable appointment of an Engineer to carry out research on coal winning The initial object is to study the fundamental principles involved in the technical process of cutting coal with a chain coal cutter This will be done with rig experiments on the forces involved in drawing a tool through coal and their variation with depth of cut, speed of traverse, slope of tool, etc Subsequently the findings will be confirmed by pit trials Candidates should have a good honours degree in mechanical engineering or equivalent professional qualifications, and preferably some experience in research Appointment will be according to qualifications and experience as either Scientist II (scale £800 by £35 to £1,150 male), or Scientist III (scale £500 by £25 to £950 male), London location allowance of £34 at the minimum rising to £82 at the maximum of the scales is payable in addition —Write, giving full particulars (in chronological order) of age, education, qualifications and experience (with dates), to National Coal Board, Establishments (Personnel), Hobart House, Grosvenor Place, London, S W 1, marking envelope TT/931 Original testimonials should not be forwarded Closing date March 12, 1955

THE UNITED KINGDOM ATOMIC ENERGY Authority invites applications for Assistant Experimental Officers and Assistants (Scientific) for general chemical, physical and analytical duties on shift, at its Chemical Services Laboratories, Springfield Works, near Preston Applicants for the Assistant Experimental Officer posts should have a higher school certificate, or equivalent in science subjects, and for the Assistant (Scientific) posts, candidates should have a school certificate with a credit in a science subject, or equivalent Salary for the Assistant Experimental Officer posts will be assessed according to age and qualifications between £310 (at age 18) to £685 per annum, and for the Assistant (Scientific) posts between £235 (at age 16) to £550 per annum In addition, there is a shift allowance of approximately £52 per annum, in each case There is a contributory superannuation scheme and travelling expenses in excess of 4s per week are refundable to officers receiving less than £605 per annum Career prospects and leave allowances are good, and opportunities for permanent day work occur from time to time —Applications to The Works General Manager, UNITED KINGDOM ATOMIC ENERGY AUTHORITY, Springfields Works, Salwick, near Preston Lancs, quoting 824

TECHNICIAN REQUIRED AT ONCE WITH experience of Histological Technique for research laboratory —Apply Secretary, Institute of Dermatology, St John's Hospital for Diseases of the Skin, Lisle Street, Leicester Square, W C 2

ST BARTHOLOMEW'S HOSPITAL
LONDON, E C 1

Applications are invited for the post of Chemical Pathologist to the Hospital and Lecturer in Chemical Pathology to the Medical College, tenable as from July 1, 1955 The successful candidate will be on a full-time salary basis part of which will be paid by the hospital and part by the medical college The appointment will be subject to a satisfactory health report

Applications, together with the names of three referees should be received not later than April 1 1955 and should be addressed to C C Carus-Wilson Clerk to the Governors

INSTITUTE OF UROLOGY
IN ASSOCIATION WITH ST PETER'S
ST PAUL'S AND ST PHILIP'S HOSPITALS

Full-time Biochemist (science degree or medical qualifications essential) required for work in connection with urological disease Experience of routine biochemical tests and an interest in research necessary The post is of senior grade and Whitley Council scales will apply

Apply Secretary Institute of Urology, 10 Henrietta Street W C 2 stating age qualifications and experience and enclosing copies of two recent testimonials Closing date March 12 1955

N I A E SCOTTISH STATION

Scientific Officer required for research on agricultural engineering projects particularly the performance of tractors and implements on hillsides An honours degree (or equivalent) in mechanical engineering essential and previous research experience with strain gauge equipment a considerable advantage Salary scale £467 10s to £845, plus at present 3 per cent extra duty allowance

Further particulars of duties details of commencement salary and superannuation and application form from the National Institute of Agricultural Engineering Scottish Station, Howden Mid-Calder Midlothian

BRADFORD EDUCATION COMMITTEE
TECHNICAL COLLEGE BRADFORD
BRADFORD DYERS' ASSOCIATION
RESEARCH FELLOWSHIP

Applications are invited for a Research Fellowship provided by the Bradford Dyers' Association Limited and tenable in the College for two years The minimum value of the Fellowship will be £600 per annum the commencing rate depending upon qualifications and experience The Fellow should hold high qualifications in science He will be required to undertake research in the College in tinctorial chemistry textile chemistry or an allied subject

Forms of application may be obtained on application to the Principal, Technical College, Bradford

THE UNITED KINGDOM ATOMIC ENERGY Authority at Risley near Warrington requires a Metallurgist to be responsible to a Senior Technical Control Officer for the co-ordination of the activities of the Operations Branch in the production of suitable metals alloys and cartridges for use in various nuclear reactors and for the correlating of research and development activities with operational experience in various establishments Applicants must have an honours degree in metallurgy or have equivalent qualifications and practical and theoretical experience of solid state physics is very desirable Salary will be assessed according to qualifications and experience within the scales £1 425 to £1 620 per annum or £1 065 to £1 370 per annum The successful candidate will be required to join the Authority's contributory pension scheme —Applications to THE UNITED KINGDOM ATOMIC ENERGY AUTHORITY Industrial Group Headquarters Risley Warrington quoting 823

COMPUTOR REQUIRED BY MINISTRY OF Supply National Aeronautical Establishment Bedford to take charge of preparation of computing programmes and supervise staff engaged on Hollerith punched card machines and the operation of Hollerith electronic computing equipment Qualifications higher school certificate (science) including mathematics Pass degree in mathematics or experience in computing an advantage Training course given soon after appointment Appointment in Experimental Officer class and salary assessed according to age and experience within range £288 10s (age 18) to £880 Women somewhat less Not established but opportunities to compete for establishment may arise —Application forms from Ministry of Labour and National Service, Technical and Scientific Register (K) 26 King Street London S W 1 quoting A 47/5A Closing date March 19 1955

NEW SOUTH WALES DEPARTMENT OF AGRICULTURE
WAGGA AUSTRALIA
AGRICULTURAL RESEARCH INSTITUTE
CEREAL TECHNICIAN

Applications are invited for the above position Salary in the range £A 897 to £A 1 067 per annum rising to £A 1 271 per annum, subject to specified conditions Appointee will be responsible for the technical work involved in the assessment of wheat quality including laboratory milling tests on dough quality and experimental bread making Experience in this type of work essential Appointee should have the Intermediate B Sc or equivalent qualification Science background an advantage Accommodation for married and single men being erected Appointee will be eligible subject to medical examination to contribute to the State Superannuation Fund Shipping fares to Sydney of appointee and family will be paid

Four copies of applications (together with four copies of testimonials and other supporting documents) should be lodged with the Agent-General for New South Wales 56 Strand London W C 2 (from whom further particulars can be obtained), by March 14 1955

LAW HOSPITAL
CARLUKE, LANARKSHIRE

Applications are invited from science graduates for the post of Biochemist (non medical) at Law Hospital The successful applicant will work under the direction of the Consultant Biochemist Salary and conditions of service based on Whitley Council scales either on the basic grade or senior grade according to experience and qualifications Single accommodation available if desired

Applications stating age, qualifications and experience together with the names of two persons to whom reference can be made, to be addressed to The Group Secretary and Treasurer Board of Management Law Hospital Carluke

UNIVERSITY OF SOUTHAMPTON

Applications are invited for the post of Lecturer in Applied Mathematics Salary depending on qualifications and experience within the range £650 to £1 350 per annum together with F.S S U and children s allowances

Further particulars may be obtained from the Secretary and Registrar to whom applications (six copies) should be sent not later than March 31, 1955

UNIVERSITY OF MANCHESTER

Applications are invited for the post of Assistant Lecturer in Theoretical Physics Salary on a scale £450 to £550 per annum (salary scales are at present under review) Membership of F S S U and children's allowance scheme

Applications should be sent not later than March 16 1955 to the Registrar The University Manchester 13 from whom further particulars and forms of application may be obtained

ST THOMAS' HOSPITAL
LONDON S E 1

Laboratory Assistant or Radiographer required for measurements in applications of radioactive isotopes to medical problems Qualifications in science mathematics or radiography desirable Grading of posts and salary dependent upon qualifications and experience

Applications giving age experience, qualifications and names of two referees to the Personnel Officer by March 12 1955

MATHEMATICIANS REQUIRED AT VARIous Ministry of Supply Research and Development Establishments in Southern England Qualifications First- or second-class honours degree in mathematics preferably with some research experience in an applied field Appointments in Scientific Officer grade Salary range £467 10s to £845 Women somewhat less F S S U benefits may be available Prospects of promotion to Senior Scientific Officer (minimum age 26) within salary range £970 to £1 125 Not established but opportunities to compete for establishment may arise —Application forms from Ministry of Labour and National Service Technical and Scientific Register (K) 26 King Street London S W 1, quoting A28/5A

UNIVERSITY OF LONDON, KING S COLlege will require on October 1, 1955, a Lecturer in Vertebrate Zoology The duties will include responsibility for the organization of the teaching in that subject Salary scale £700 by £50 to £1 000, £1 050 by £50 to £1 400 with family allowances and superannuation benefits —Particulars and application forms should be obtained from the Registrar King s College, Strand W C.2, whom completed applications must reach by March 18

UNIVERSITY OF ALBERTA
FACULTY OF AGRICULTURE

Applications are invited for the position c Assistant Professor of Soil Science duties t commence on September 1 1955 Initial salary $4 000 to $5,000, depending on qualifications an experience There is a cost of-living bonus c about $300 and the normal yearly increment i $250 Preference will be given to a universi graduate with a Ph D degree or equivalent training who has specialized in soil science Dutie will include research teaching soil testing, an extension work in soil science Confirmatio of the appointment will be subject to the satisfactory completion of a probationary period c two to four years

Applications should be addressed to the Hea of the Department of Soil Science, Faculty c Agriculture University of Alberta Edmonto Alberta and should give details of training an experience personal information the names c three referees and be accompanied by a recen photograph Closing date May 1 1955

COURTAULD INSTITUTE OF BIOCHEMISTRY
MIDDLESEX HOSPITAL LONDON W 1

Applications are invited from qualified bic chemists for work on the quantitative determina tion of oestrogens Experience of isotope tech n que advantageous Salary £750 per annum

Applications stating age, experience shoul reach the Secretary not later than March 26 195

READER AND SENIOR LECTURERS O Lecturers in Physics —The Dean College of Ar and Science Baghdad Iraq

APPOINTMENTS VACANT

TECHNICAL LIBRARIAN
WOMAN

Courtaulds Limited require a technical libraria (woman) for a new research laboratory Coventry Candidates should have a knowled of chemistry to degree standard and previous experience in an industrial technical library

Candidates should write for a detailed form application to the Director of Personnel Cour aulds Limited 16 St Martin s le Grand Londo E C 1 quoting the reference number D 60

CANADA OUTSTANDING PROSPECT exist for Electro-mechanical Engineers in expan ing Canadian Company situated in the attracti City of Ottawa concerned with design and de velopment of Aircraft instruments navigati instruments guided weapons fire control equi ment flight simulators etc Openings availab immediately for electro-mechanical engineers wi a knowledge of servo-mechanisms and with tw or more years of practical experience in desi and development of the type of equipment list above Engineers should possess a degree equivalent from a university or recognized techn cal college and be 27 years of age or old Salaries in the range $6 000 to $8 000 per annu and include fringe benefits such as health an accident insurance, sick leave and holidays w pay A five-day forty-hour week is work Assistance in passage to Canada can be arrang Interviews will be arranged in London during week March 7 to 11 —Applications to the Sec tary, The Professional Engineers Appointme Bureau 9 Victoria Street, London S W 1, m be received not later than March 5

RESEARCH CHEMIST THE BRITIS Drug Houses Ltd have a vacancy in their Ch mical Research Laboratories for a young wom graduate interested in steroid chemistry Previo experience desirable but not essential —Wr giving details of studies experience, if any a age to Staff Manager, Graham Street, City Roa N 1

RESEARCH ENGINEERS HONOU graduates preferably with some postgraduate industrial research experience capable of pl ning and controlling research work on a w range of mechanical engineering problems incl ing materials structures, mechanisms and h transfer Wide scope and good prospects men with initiative Age 25 to 30 approximate —Applicants should write to Manager Resea Department Metropolitan-Vickers Electrical Ltd Trafford Park Manchester 17 giving statement of their age qualifications and expe ence and suitable references

LADY CHEMIST GRADUATE OR H N required for analysis of electroplating and al solutions —Apply Electro-Chemical Engineer Co Ltd , 161 Queens Road Weybridge Surr

JOSEPH LUCAS LTD.

offer opportunities in

LIGHT ENGINEERING

for University Graduates with
Science and Engineering Degrees

Interviewing of applicants is now in progress for Post Graduate Training Courses commencing this Autumn A few vacancies for direct employment with this Organisation are also available for Graduates with suitable qualifications Further particulars can be obtained from the Secretaries, Universities Appointments Boards, or from the **Personnel Manager, Joseph Lucas (Electrical) Ltd , Great King Street, Birmingham, 19, quoting reference PM/D'61.**

SENIOR RESEARCH CHEMIST IS RE- uired by Imperial Smelting Corporation Limited › carry out investigations into the preparation f fluorine containing polymers and the determina- on of properties of the polymers Applicants iould preferably have had relevant experience f polymer or fluorine research work and possess 1 honours or postgraduate degree, although ap- ications will be entertained from persons ss qualified, but with relevant experience — pplications to Personnel Manager, Imperial nelting Corporation Ltd , St Andrew's Road vonmouth, near Bristol, quoting reference RG/N

WANTED TECHNICAL ASSISTANT FOR les and office routine in connection with ap- iratus for X-ray crystallography A general iowledge and experience of X-ray crystallo- aphy and technical engineering subjects is essen- il together with ability to deal with correspon- nce Age between 25 and 40 —Solus-Schall, mited, 18-22 New Cavendish Street, London, ' 1

REVERTEX LTD , HARLOW, ESSEX RE- ire a chemist for technical service work on bber latex and synthetic resin emulsions Hous- g available at controlled rents Good oppor- nties for travel —Full details to Chief Chemist

---

PHILIPS RESEARCH LABORATORIES RE- ire a graduate chemist (female) with general gree or Inter B Sc for important routine asurements on materials and components as ed in the electronics ndustry Age not over years Interesting work in modern laboratory uated on southern outskirts of London Good mmencing salary will be paid according to age, ility and experience —Please apply in writing the Personnel Officer Philips Electrical Indus- es Ltd , New Road, Mitcham Junction, Surrey, oting the reference M R 146/MBL

BRITISH NYLON SPINNERS LIMITED RE- ire an Information Assistant in their Library d Information Section The work will be ried and includes indexing of technical literature d the making of literature surveys The mini- im qualification is general certificate of educa- n advanced level, with chemistry as one sub- t but persons with higher qualifications or ex- ience in a technical library will be given ference The appointment is permanent and isionable Five-day week —Apply in writing to sonnel Manager Pontypool Mon

---

THE UNITED GLASS BOTTLE MANUFAC- ers Ltd require for research and development rk honours graduates in engineering physics, mistry or fuel technology with or without re- rch or plant experience Competitive salary ording to qualifications and experience Ex- lent prospects on research and production — ply in writing to, Personnel Manager The ited Glass Bottle Manufacturers Ltd 8 cester Street London W C 2

T & H SMITH LTD HAVE A VACANCY their works at Edinburgh for a qualified irmacist or chemist under 35 years of age, for resting work in connection with the develop- nt and production of allergy preparations erannuation scheme in force —Apply giving personal particulars to Works Director, T H Smith Ltd Blandfield Chemical Works, heatfield Road Edinburgh 11

ENGLISH CLAYS LOVERING POCHIN & Ltd St Austell Cornwall, have vacancies the Research Department for (1) an Inorganic emist with postgraduate experience, (2) a aduate Physical Chemist —Application in con- ence to the Research Manager

---

A SCIENCE GRADUATE WHO IS INterested in a progressive career in modern manufacturing is required by a large and growing company with chemical interests During the last 25 years the company has met its expansion needs by the introduction of graduates of progressive outlook who wished to make a career in modern industry, and who wished to develop in the managerial and executive field without losing touch with technical matters Most of these men have read chemistry, but it has appealed also to the engineer or physicist who wished to veer away from the purely technical field The initial position, after training will be the management of a small process or production department The position will be clearly defined in both responsibility and authority and will be preceded by careful training under senior graduate members This training will be continued long enough to ensure the position is taken over with confidence Two other positions of a similar nature will be available later in the year, and applications from interested graduates taking finals this summer, or from men in the Services, will be considered now Upper age limit 27 years Commencing salary £650 to £850 depending upon the candidate's background, and this will be paid during the training period At the end of training full scope will be given for the use of ability and initiative and progress will be related solely to merit All senior positions are without exception filled from within the company Strict confidence will be observed —Please forward a brief outline of background, etc , to Box 648, T G Scott and Son, Ltd , 143-147 Regent Street, London W 1

JOSEPH LUCAS, LIMITED HAVE AN INteresting vacancy in their research and development laboratories which would be suitable for a young graduate with honours degree in mathematics or physics The work is largely of a fundamental nature and is concerned with acoustics and mechanical vibrations Previous industrial experience is not necessary —Please reply, giving qualifications, age, and any other relevant details to Personnel Manager, Joseph Lucas (Electrical) Ltd , Great King Street, Birmingham, quoting reference PM/D/59

TUBE INVESTMENTS RESEARCH Laboratories require a young scientist for work in polymer research and measurements of properties of plastics Excellent prospects for advancement as a member of a team engaged on fundamental research in a vital new field —Apply giving qualifications and experience, to the Secretary, Tube Investments Research Laboratories Hinxton Hall Saffron Walden

---

A SPONSORED RESEARCH ORGANIZAtion requires young Organic Chemists, male or female with honours degree or equivalent for research and development work Recently graduated applicants would find this an interesting opening to industrial research Applications are also invited from organic chemists for a more senior position —Full particulars, in confidence, to J A Radley, Industrial Research and Development Laboratories Elgar Road, Reading

---

A GRADUATE IS REQUIRED FOR BASIC and applied research on the machining and cold forming of metals A good degree (or equivalent qualification) in engineering, science or metallurgy is required There are good prospects for advancement Commencing salary commensurate with qualifications and experience Pension scheme —Send full details, including age experience qualifications and present salary in confidence to Box 649, T G Scott and Son Ltd 143-147 Regent Street, London, W 1

RESEARCH AND DEVELOPMENT

Courtaulds, Ltd , invite applications for the following vacancies in their Research and Development Laboratories, Bocking Braintree, Essex Graduate Textile Technologist, age 27-32, with industrial experience to work on textile dyeing and finishing Ref No D 61 Graduate Textile Technologist, to work on Research and Development in the field of textile manufacture Ref No D 62 Graduate Chemist, age 33 or less, for work on textile sizing Ref No D 63

Candidates should write for a detailed form of application to the Director of Personnel, Courtaulds, Limited, 16 St Martin's-le-Grand, London, E C 1, quoting the appropriate reference number

---

CHEMIST

HONOURS GRADUATE

Courtaulds, Ltd , has a vacancy in its Textile Research Laboratory at Bocking Essex, for a Graduate Physical Chemist who is interested in the basic physical problems of textile chemistry and is prepared to contribute original ideas in a developing situation Applicants should possess an honours degree and have had practical experience of research methods Age 25 to 33

Candidates should write for a detailed form of application to the Director of Personnel Courtaulds, Ltd , 16 St Martin's-le-Grand London, E C 1, quoting the reference number D 64

MULLARD RESEARCH LABORATORIES invite applications from honours graduates to carry out research and development on the application of new magnetic materials to computors Initially, the work will be concerned with digital storage and information-handling devices incorporating ferrite cores

Postgraduate experience in either computor techniques, transistors or magnetic devices would be an advantage The work calls for a high degree of individual responsibility and there is great scope for initiative and inventiveness Publication of results will be encouraged

Salaries based on qualifications, experience and age, and are in keeping with present-day levels General prospects within the organization are excellent

Applications to

Mr G A Taylor,
Personnel Manager,
Mullard Research Laboratories,
Cross Oak Lane, Salfords,
near Redhill, Surrey,
quoting reference, E R L

APPLICATIONS ARE INVITED FROM recently qualified chemists for an interesting and progressive post in a cereal laboratory The work will involve non-routine analysis and research Applicants should be in the 20-25 age group Five-day week and pension scheme in operation —Write giving full particulars of academic qualifications and experience to Personnel Manager (L), Quaker Oats Limited, Bridge Road, Southall, Middlesex

---

TECHNICAL SALESMAN EXPERIENCED and qualified to develop chemical sales to vinyl resin manufacturers Interesting post good prospects Pension and profits-sharing schemes — Write full details age, qualifications experience to date, and salary required, to Ref TSP Box 8336 c/o Charles Barker & Sons Ltd , 31 Budge Row London, E C 4

GRADUATE CHEMIST, METALLURGIST or Chemical Engineer required to deal with problems relating to the installation of electroplating plant and process control Applicants must have completed military service and be willing to travel —Apply Electro-Chemical Engineering Co Ltd , 161 Queens Road Weybridge Surrey

---

SENIOR AND JUNIOR RESEARCH PHYSICISTS preferably with university or industrial research experience, are required to undertake basic research work of thermionic emission and related aspects of surface physics Wide scope and good prospects for men with initiative — Applicants should write to the Manager, Research Department, Metropolitan-Vickers Electrical Co Ltd , Trafford Park Manchester 17 giving particulars of their age qualifications and experience and suitable references

THE DISTILLERS COMPANY, LIMITED

A Physicist or Physical Chemist, interested in the mechanical and electrical properties of high polymers, is required at the Research and Development Department, Epsom, Surrey Duties would involve supervision of testing of a wide range of experimental plastics, fibres and rubbers, development of new test methods, and fundamental research or visco-elastic properties of polymers A good honours degree would be a minimum qualification, previous experience in the field mentioned, though desirable, is not essential This is a progressive post with excellent opportunities for the right person

Apply, Staff Manager, The Distillers Co, Ltd, 21 St James's Square London S W 1 Ref 10/55

MECHANICAL AND CHEMICAL ENGINEERS

Courtaulds, Limited Chemicals Division, requires two graduate Mechanical Engineers and one Chemical Engineer for investigational and development work near Manchester The work is of an original nature in connexion with the development of chemical plants and processes for which a real interest in, and potential talent for, engineering development work as applied to large-scale chemical plant is of paramount importance The Mechanical Engineers must have served an apprenticeship for at least two years, and all candidates must have had practical works experience Honours degree men preferred Age 25 to 35

Candidates should write for a detailed form of application to the Director of Personnel, Courtaulds, Limited, 16 St Martin's-le-Grand, London E C 1 quoting the reference number H8 for Mechanical Engineers and H 9 for the Chemical Engineer

---

SEVERAL WELL QUALIFIED INORGANIC or Physical Chemists wanted for a special group in the research organization of a majo chemical company Men are required with high technical initiative and sound knowledge who are interested in original and development work in inorganic and organo-metal fields At least one of the appointments will carry a salary of up to £1,500 per annum —Applications are invited giving comprehensive information as to age, background and experience to Box 646, T G Scott and Son, Ltd, 143-147 Regent Street, London, W 1

PHYSICIST/MATHEMATICIAN TAYLOR, Taylor & Hobson, Ltd, require a man to specialize in the design and development of precision optical instruments He must be a skilled optical designer capable of tackling a wide range of problems and will work in close co-operation with the Mechanical Design Department A starting salary of not less than £800 per annum will be paid to a suitable candidate —Apply to Development Director, Stoughton Street Works Leicester

---

APLIN AND BARRETT, LTD YEOVIL Require a Senior Laboratory Steward for their Central Laboratories The Department includes routine and research laboratories carrying out chemical biochemical radiochemical and bacteriological work Some glass working experience would be an advantage Salary according to age and experience —Applications to Administrative Officer, Technical Department, Aplin and Barrett, Ltd Newton Road Yeovil Somerset

---

ASSISTANT WITH TECHNICAL QUALIFICATIONS required by Metropolitan-Vickers Electrical Co Ltd Trafford Park, Manchester, 17, to train as Industrial Information Officer Experience of this type of work is not essential Salary will depend on qualifications and experience and will be progressive —Write, giving full particulars, including age sex, nationality education and experience to Personnel Manager, marking envelope "H 2"

MULLARD RESEARCH LABORATORIES in Surrey have a number of vacancies for Physicists and Electronic Engineers with a good degree or equivalent qualification, for work in a variety of projects, including

(1) SOLID PHYSICS AND SEMICONDUCTORS

(2) MAGNETIC MATERIALS AND APPLICATIONS

(3) MICROWAVE TECHNIQUES

(4) ADVANCED ELECTRONIC CIRCUIT TECHNIQUES INCLUDING TRANSISTOR APPLICATIONS

(5) COLOUR TELEVISION

(6) COMPUTORS AND SERVO-MECHANISMS

Some years' experience in one or more of these fields is desirable, but recent and prospective graduates are also invited to apply Mathematics graduates with experimental leanings are not excluded

Successful applicants will join teams engaged on research and advanced development projects Publication of original work wherever possible is encouraged

Salaries are based on qualifications, experience and age, and are in keeping with present-day levels General prospects within the organization are excellent

Apply to Personnel Officer, MULLARD RESEARCH LABORATORIES, Cross Oak Lane, Salfords, near Redhill, Surrey, quoting reference E R L

ANALOGUE COMPUTORS AND INSTRUMENT servomechanisms Vacancy for an electronic Development Engineer, with experience in the above fields for work on interesting and varied projects Candidates should be of degree standard in physics or engineering, with some years' industrial experience Good prospects with progressive firm in Surrey area Write, giving full details of experience and salary required Ref S P D 2—Box 653 T G Scott and Son, Ltd, 143-147 Regent Street, London, W 1

DIVISIONAL SALES AND CONTRACTS Manager required for expanding medium-sized electronics company Applicants should be capable forthwith of initiating and negotiating development and manufacturing contracts in the electronic field and also at a later date establishing a sales organization for a commercial product Good opportunity for a man with initiative, prepared for hard work, and capable of earning £2,000 per annum Salary will include basic payment and commission by arrangement —Applications invited in confidence to Ref S P D 3 Box 654, T G Scott and Son, Ltd, 143-147 Regent Street, London, W 1

CHEMISTRY AND ELECTRONICS A Scientist or Engineer, with good qualifications in one of these fields, and a strong interest in the other, is required to carry out development work on the application of electronic techniques to chemical analysis Good salary and prospects with progressive firm in Surrey area Write, giving full details of experience and salary required Ref S P D 1—Box 655, T G Scott and Son, Ltd, 143-147 Regent Street, London W 1

IMPERIAL CHEMICAL INDUSTRIES Limited, Paints Division, Slough, Bucks, has several vacancies for men aged 23 to 28 who have degrees in science or arts and who have a deep-rooted interest in the application of their training and abilities to commercial work Successful applicants may be required to spend a period of technical or practical training work in the Division, and will then be transferred to posts involving the sales service or distribution of a wide variety of industrial and decorative paints Experience of up to three years in some other industry would be no drawback and might be an advantage All posts would be pensionable —Apply, in writing, to Division Staff Officer, Imperial Chemical Industries Limited, Paints Division Wexham Road, Slough Bucks

---

MONSANTO CHEMICALS LIMITED HAV the following vacancies in the new research establishment at Newport, Mon Mechanical or Chemical Engineer for research work in the field o polymer technology Junior Physicist for researc in the field of polymer rheology and physics Fo both these posts a good honours degree is essential preferably with postgraduate research experience Good salaries, commensurate with experience, will be paid and there are excellent prospects —Applications, giving age, details of education, training and experience, should be sent t the Chief Personnel Officer, Monsanto Chemical Limited, 8 Waterloo Place, London, S W 1

GRANTS & SCHOLARSHIPS

UNIVERSITY OF LEEDS

DEPARTMENT OF COAL GAS AND FUEL INDUSTRIES WITH METALLURGY AND CHEMICAL ENGINEERING

Applications are invited from graduates we qualified in pure or applied science for Th Smith-K L G Research Scholarship for work o ceramic materials, particularly refractory oxides The Coal Tar Research Association Scholarsh for research on subjects connected with the coa tar industry, The Gas Research Fellowship provided by the Institution of Gas Engineers fo research in gas chemistry, and two posts of Research Assistant to the Joint Research Committe of the Gas Council and the university Industria experience will be an advantage, but is not esse tial The emoluments range from £325 to £60 a year

Further particulars in each case may be obtained from the Registrar, The University, Leeds 2, and detailed applications, giving the date o birth, qualifications, experience and the names o three referees should reach the Head of the Department of Coal Gas and Fuel Industries Th University, Leeds 2, not later than March 23 1955

SCHOLARSHIPS ABROAD, 1955–56

Applications are invited from British student for scholarships offered by Austria, Belgium Brazil, Denmark Egypt, Finland, France, Germany, Iceland, Italy, The Netherlands, Norway Persia, Portugal, Spain, Sweden, Switzerland an Yugoslavia The awards are mainly for university graduates and undergraduates and are tena for periods varying from a few weeks to twelv months during the academic year 1955-6 Th closing dates for receipt of applications vary fo each country, the earliest being March 7, 195

Full particulars and application forms, fo which a stamped addressed foolscap envelop should be sent, are obtainable from the Britis Council, 65 Davies Street, London, W 1, or fro any British Council office in the United Kingdo

---

BURSARIES OF £300 TO £400 PER ANNUM plus fees, for research on physical chemistry an metallurgy of metals, salts and silicates at hig temperatures with the Nuffield Research Grou in Extraction Metallurgy Imperial Colleg London S W 7 Work suitable for higher d gree Graduates in chemistry or metallurgy an those graduating this year, should apply now Dr Richardson

Colloidal MoS_2

The name of ACHESON COLLOIDS LIMITED has been associated, for over 50 years, with the manufacture of colloidal dispersions of graphite and other solids. Now to their well-known range of 'dag' dispersions, they add colloidal dispersions of molybdenum disulphide This outstanding new lubricant is being applied with great advantage to :—

Die forging, drawing, extrusion and cutting of metals,
Lubrication in operations involving high pressure and temperature,
Dry lubrication.

If you are interested in these new developments or in the various applications of our range of products our technical staff will gladly discuss them with you

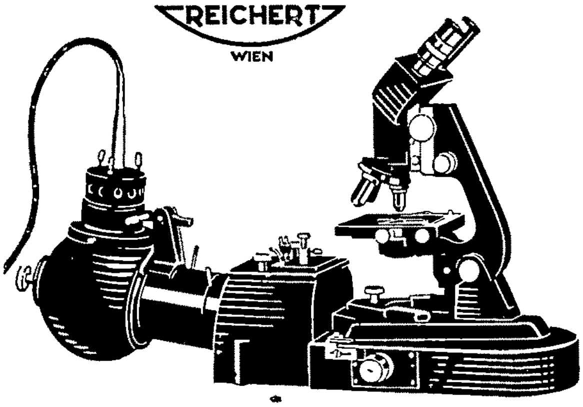
FLUORESCENCE MICROSCOPY



. . . how to apply it and where to find references

Very few microscopists in English-speaking countries have been able to avail themselves of the many advantages of fluorescence microscopy, due to the lack of detailed information and references. The Reichert Works of Vienna, who pioneered micro fluorescence equipment, have now published two booklets invaluable to everyone engaged in or contemplating the use of fluorescence microscopy :

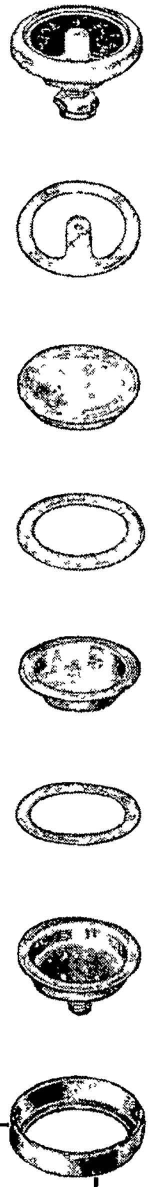
(1) *Fluorescence Microscopy with Fluorochromes*, containing 30 pages of detailed instructions for the preparation and staining of human, animal, and plant tissues and bacteriological material.

(2) *Literatur zur Fluoreszenz Mikroskopie*, containing 52 pages of cross-indexed references to books and papers published on this subject.

Copies of these two publications and full information on Reichert Fluorescence Equipment—which incidentally can be used with any existing microscope—are available free of charge on request We shall also be delighted to demonstrate the fluorescence microscope at the address given below—Please telephone us for an appointment

SHANDON

SHANDON SCIENTIFIC COMPANY LTD.
6, CROMWELL PLACE, LONDON, S W7 Tel· KNI 1131



The case for 'Castanet'...

The problems of obtaining satisfactory time constants and at the same time keeping component bulk down to a minimum are all too familiar These polarised miniature electrolytic capacitors —CASTANET by name—go all the way in removing what has for a long time been a thorn in the side of designers A mere 22 mm by 6 mm, with a capacity of 50 microfarads and a D C leakage of less than one microamp at 70V , CASTANET capacitors are capable of operating over a temperature range of—60° C to + 150° C After shelf storage, without volts, at 70°C for several thousand hours, the capacity, power factor and D.C leakage current values show no significant change

The place for 'Castanet'...

The determination of the place for CASTANET is simple It is anywhere where space is at a premium and essential characteristics demand stability of performance coupled with low leakage current over a very wide temperature range The units are normally provided with a 4 BA stud and anode tag A silicone rubber grommet is available by means of which the units can be mounted on a chassis and connected in series or parallel, providing a range of working voltages and capacities

Time constants of the order of one hour can be obtained making the units ideal for very long period discharge circuitry, in addition to the more conventional applications

Plessey

new, arresting
STANTON 'Synchro-Release'
...controls release AND arrestment...
brings knives and bearings smoothly into contact without impact
–independently of the user

The most careful chemist could not release a balance more smoothly than the Stanton "Synchro-Release" device So gently controlled is the automatic motion of the "Synchro-Release" mechanism that knife edges and bearings are brought into contact swiftly, safely, accurately, without the slightest jarring or vibration of impact no matter how hurried or unskilled the operator may be

ALL Stanton balances can now be supplied with "Synchro-Release" giving these extra advantages —

- **Safely controls arrestment as well as release.**
- **No loss in weighing time**
- **Ensures sustained accuracy on routine weighings.**
- **Simple, sturdy synchronous device—nothing to go wrong.**
- **Facilitates training of laboratory personnel.**
- **Reduces balance operating costs**

DORAN

MINI THERMO-COUPLE POTENTIOMETER
CAT. NO. E4229

This instrument is a development of the standard Mini Thermo-couple Potentiometer which is fully described in List 112. It has two ranges of 20 and 100 millivolts and is direct reading to 10 microvolts and 50 microvolts respectively, each of these values being represented by one division on the slide wire dial. The potentiometer circuit is standardised against a Weston Normal Cell and the Potentiometer current is derived from a 1·5 volt dry cell fitted internally. To enable the instrument to be employed for the checking of thermo-electric indicators and recorders, an additional unit, usually known as a potential source, is provided, which gives an adjustable e.m.f from 0–100 millivolts—which is applied to the instrument under test. The Potentiometer itself then measures the e.m.f. required to deflect the indicator or recorder to any particular point on the scale. The instrument is self-contained and is very compact.

SPECIFICATION.
Range: 20 and 100 millivolts
Weight: 9¾ lb.
Dimensions: 11 in. × 7 in. × 5¾ in.

ET3

sub-miniature

ELECTROMETER

TRIODE

The ET3 is of special interest where an electrometer valve of small dimensions is required as in portable equipment. The flexible leads render a valve holder unnecessary and the low filament rating of 1·25V, 25mA permits the valve to be run entirely from small dry cells.

The input resistance is greater than 10^{14} ohms and a water repellent coating is applied to the glass envelope which virtually eliminates condensation in conditions of high humidity.

Full technical information may be obtained on application from The Osram Valve & Electronics Department.

AIR POLLUTION

THE results of a painstaking examination of the problem of air pollution, to which the attention of the public was acutely aroused by the lamentable consequences of the London fog of December 1950, appears in the recently issued report of the Committee on Air Pollution, presided over by Sir Hugh Beaver*. The published report is crowded from cover to cover with the results of detailed investigations of the manifold aspects of the problems encountered, and therein is set forth a series of recommendations, aptly defined as a clean air policy.

Legislation is called for to strengthen the law with regard to the abatement of atmospheric pollution. Quite a number of additional recommendations cover important aspects of public policy, which will command general acceptance, indeed, they are the logical development of efforts to improve the situation that have been prosecuted steadily for many years. Foremost among these more beneficent influences has been the general impact of research and engineering development on the design and use of combustion appliances in both the industrial and the domestic fields. The responsibility for atmospheric pollution is shown to fall about equally in these two spheres The most difficult problem is the domestic one The Committee considers that it is the cumulative effect of light smoke from a number of low chimneys that really matters, and the legislative provision recommended entails the institution of smokeless zones and smoke-control areas A snag arises in the proposal that the Exchequer and the local authority are to contribute jointly towards the cost of converting domestic appliances in these areas. The installation of appliances of improved types for the main domestic space- and water-heating services is to be made compulsory in the case of new premises. Much higher penalties are to be invoked for the enforcement of the law of pollution abatement The power-stations that burn pulverized fuel in any form beyond a rate of ten tons per hour are to instal efficient dust- and grit-arresting equipment. Cement kilns are apparently not to be subjected to this control, on the grounds of the greater technical difficulties involved, although it is well known by the public that some of the most pleasant beauty spots are plagued by this nuisance It could have been wished that there had been a more incisive and courageous recommendation on this issue

The question of sulphur pollution has been closely examined, and some of the possibilities indicated, but the value of a national policy of total gasification has been overlooked. It is true to say that more research effort in this direction is needed for a satisfactory process to be developed, but it is clear that the most effective means of removing sulphur, and indeed of recovering it in a useful form, is through gas purification. Though coke has many advantages as a means of domestic heating, it must be emphasized that the reserves of coking coal are limited. So far as coal is concerned, the larger reserves of less satisfactorily coking coals must be sooner or later brought into the picture

Railway smoke comes in for strong condemnation, since more than one-seventh of the smoke discharged to the atmosphere comes from this source The answer which is in line with the Committee's recommendations has been given by the proposals of the Transport Commission for the future development of British railways by the substitution of the steam locomotive by electrification and the most convenient form of diesel-engine traction. An unexpected situation arises in respect of motor-vehicle exhausts, which can be a serious menace. The present law is explicit and believed to be adequate, but the Committee could not find that it was, in fact, enforced

There is a strong call for the use of smokeless fuels in the so-called 'black areas', and doubtless the development of this remedy will be followed as ways and means become available. To stimulate the use of gas and electricity, the removal of purchase tax on appliances is urged.

As to the precise measures to be taken to put into effect the very desirable requirements foreshadowed, the Government has already indicated by a recent announcement in the House of Commons that it has recognized that the key to the domestic smoke problem lies in the displacement of obsolescent equipment by more efficient types, and that the extension of smokeless zones must be made practicable by assistance in purchasing modern types from central or local government funds

In the application of the many other recommendations of the Committee, it is hoped that there will not occur a possible danger of the confusion of the technical and administrative functions in putting the appropriate measures into action. This danger has long been a national failing, in regard to which technical opinion has not always been so forceful, or even active at all, in the right quarters as it should be Initiative for certain technical measures is placed at the door of the British Standards Institution, when it should be more properly found in the board rooms and laboratories of the expert technical institutions, which must provide the pertinent bases for the specifications required.

The well-worn demand that stoking should be regarded as a skilled operation is repeated. One may only hope that the simile of water wearing away the stone will be here applicable

Twelve appendixes of both technical value and public interest have been provided. Finally, a list of some hundred and thirty authorities that have been consulted are listed There must have been numerous other individuals also consulted The evidence is thus abundant that Sir Hugh Beaver and his Committee have laboured very hard in the public interest, and it is to be hoped that the response of the authorities concerned will be effective and prompt

CHEMICAL CONSTITUTION

Chemical Constitution

An Introduction to the Theory of the Chemical Bond. By Prof. Dr. J A. A. Ketelaar Pp. viii+398 (Amsterdam and New York: Elsevier Publishing Company, Inc., London. Cleaver-Hume Press, Ltd., 1953) 40*s*.

CHEMISTRY has been revolutionized in the past thirty years by the development of quantum theory, and by the fresh insight the theory gave into problems of atomic and molecular structure The new ideas spread rapidly under the influence of several notable monographs In recent years, however, a growing rift has separated the theoreticians from chemists in general, largely because the more recent developments have not been adequately described in simple terms in book form, and the lack of text-books has also hindered the teaching of theoretical chemistry. Prof J A A Ketelaar's book is an attempt to fill this gap: it is described as "an introduction to the theory of the chemical bond" and is clearly intended for the general reader.

The book falls into five sections First, an introductory section on the Periodic Table, the basic ideas of wave mechanics and the types of chemical bond, next, a section on ionic compounds treated from the classical point of view, next, a section on the covalent bond, beginning with the quantum mechanical treatment of covalency and the structures of simple molecules, and continuing with a discussion, in terms of resonance theory, of complex molecules and of such topics as conjugation, bond properties, chemical reactivity and colour, next, a short section on metals, and finally, a section on van der Waals forces and the hydrogen bond There are bibliographies at the ends of sections, but few references.

The intention and general plan of the book are excellent, but unfortunately the execution leaves much to be desired. First, the more elementary sections are too condensed to be intelligible to a reader who needed them, this criticism applies to the whole of the first section, to the quantum mechanical treatment of covalency in the third section, and to the section on metals The situation is made worse by the introduction of irrelevant complications (for example, pp. 9–10) and by an approach sufficiently mathematical to intimidate the uninitiated reader but totally inadequate as an introduction to the detailed mathematical theory. Secondly, the book is very badly constructed. Throughout the text there are numerous references to later sections, new ideas are introduced without explanation (for example, the table on p. 20, dipoles on p 72, the Planck and Einstein relations on p 107, the Bohr atom on p 109, overlap on p 149, bond character on pp 175, 186), and when new ideas are introduced they are often not treated coherently in one place (for example, *s-p* hybridization is discussed in detail on pp 153–54, but dsp^2 hybridization is mentioned without explanation on p 173) Thirdly, the segregation of ionic and covalent compounds has its drawbacks, typical covalent compounds are discussed as though they were ionic in the second section (pp 54, 55, 60), and the relation between ionic and covalent bonds is nowhere adequately discussed.

There are various small errors and omissions. For example it is implied incorrectly on p. 152 that a linear combination of non-degenerate solutions of a wave equation is itself a solution, the inductive effect is wrongly described on p 221, the explanation for the instability of vinyl alcohol on p. 222 is incorrect, and on p 239 the author has overlooked recent work on Tschitschibabin's hydrocarbon

The general impression is of a book written without adequate planning or integration and consequently too obscure for the uninitiated reader. A reader familiar with the field will find much to interest him although he may feel the lack of adequate references Most of the references are to papers dealing in detail with advanced and irrelevant topics (for example, nuclear resonance, p. 199)

The book is very well produced and pleasantly free from misprints. The price is very reasonable.

M. J S. DEWAR

BIOCHEMISTRY FOR MEDICAL STUDENTS

Biochemistry

By Prof. Abraham Cantarow and Dr Bernard Schepartz. Pp xxv+848. (Philadelphia and London: W. B. Saunders Company, 1954.) 55*s*.

THIS is designed primarily as a text-book for medical students, but it is doubtful whether as such it will have much appeal in Britain In most British universities, the departments of anatomy and physiology and biochemistry compete keenly for the student's time, and as things work out the medical student simply has not the time to deal with biochemistry in anything like the detail in which it is presented in this 800-page volume. If he attempts to do so he is likely to miss the wood for the trees and to develop a dislike for the subject. To take one example of this excessive detail and of lack of balance between one topic and another, nearly forty pages are devoted to what the authors term the metabolic "rugged individualism" of the amino-acids, whereas the absorption of fat is dismissed in a couple of pages

More might have been said about how some of the important advances in biochemistry have been made. For example, in dealing with carbohydrate metabolism, some description might surely have been given of Claude Bernard's fundamental experiments leading to the discovery of glycogen and its role in blood-sugar regulation. Things like this make a subject interesting and they are often remembered by the student, and are worth remembering, when a great deal else has long been forgotten Instead, the student is faced as early as p 3 with about fifty divisions and sub-divisions of the carbohydrates, and on the next page he is further discouraged by finding the names and structures of all twelve D-hexoses where three or four would have sufficed. It is surprising that the authors have not adopted the elegant and more realistic method of Haworth for showing the structures of the carbohydrates. The Fischer formulæ when applied, as they are here, to disaccharides and even to polysaccharides may well strike the student as looking like radio wiring diagrams rather than structures of molecules.

At one point, where apparently the authors felt that the book needed a bit of light relief, there is a deplorable reproduction of a dog which is said to be afraid that the essential amino-acid tryptophan has been omitted from its dish of food. The book needs lightening in a much more substantial way than this if it is to appeal to medical students and give them a lasting interest in biochemistry Nowadays, writers of preclinical text-books ought surely to ask themselves all the time what can be left out rather than what can be put in, and whether the information can be presented to the student in a more vivid and more intelligible way by omitting details and unessential facts

It should be emphasized that these criticisms apply mainly to the book as a text-book for medical students, though that, after all, is its declared purpose As a book for science students with more time for biochemistry, it is in many ways excellent The biochemical reactions and metabolic cycles are well set out in the figures, there are numerous cross-references, and important topics such as enzyme action and metabolic antagonism are discussed clearly and illustrated by helpful diagrams There are a good many minor slips and misprints, but these are perhaps excusable in the first edition of a book containing so much detail. Science students and their teachers will find this a useful, original and up-to-date text-book It should find a place beside its well-known companion volume, "Clinical Biochemistry", by Cantarow and Trumper, which incidentally managed to cover its ground without using any chemical formulæ more elaborate than that of carbonic acid.

D C Harrison

A PHILOSOPHICAL TREASURE-HUNT

Treasury of Philosophy

Edited by Dagobert D. Runes. Pp. xxiv+1280. (New York · Philosophical Library, 1955) 15 dollars

THIS volume is another of the huge compilations so much in favour in the United States It contains extracts, prefaced by brief introductions, from the works of nearly four hundred writers, they range from Anaximander to Sartre, from Chuang Chu to Johann Comenius. There are excerpts from the works of Oriental philosophers and theologians, medieval Hebrew writers and the Arab commentators on Aristotle Some of this material is, we are told, here made available in English for the first time, though the translators are frequently not named. It is valuable to have some indication of the views of the less well known of these thinkers. The editor observes with some justice that American philosophers are too much neglected in European surveys of the subject, and accordingly he tries to remedy this deficiency Unfortunately, he has included the work of unimportant people like Henry Ward Beecher and Amos Alcott, the father of Louisa May, who ramble on in the folksy 'philosophizing' vein of Will Rogers It is very surprising that no reference whatever is made to what is probably the most remarkable American contribution to philosophy, the "Treatise on Language" by Alexander Bryan Johnson, published in 1836.

The book as a whole is vitiated by two serious deficiencies There is no principle of selection, in fact, Dr Runes admits that he has no clearer conception of philosophy than that it is "the search for the undefinable", and he asserts that the only thing common to the contributors is that they have at some time "sat down to meditate upon the wondrous themata that came to their minds in uncharted realms". It is scarcely surprising that such a wide-meshed net has failed to keep out writers like Walt Whitman, Charles Lamb and Maurice Maeterlinck. The second shortcoming is a consequence of the huge scale of the anthology, which is so ambitious as to be self-defeating The extracts are perforce so brief that many are scarcely intelligible For this reason, considerations of price apart, the book cannot be recommended as an introduction to the subject, while anyone with some acquaintance with philosophy will probably find reading it a depressing experience, it is like walking around a dissecting-room scattered with the disjointed members of one's friends.

A TEXT-BOOK OF EMBRYOLOGY

Developmental Anatomy

A Textbook and Laboratory Manual of Embryology. By Dr Leslie Brainerd Arey. Sixth edition. Pp. xi+680. (Philadelphia and London W. B. Saunders Company, 1954) 47*s.* 6*d.*

THE present volume has been extensively revised in the light of recent developments in embryology. In addition, the material in the book has also been rearranged so that there are now twenty-eight chapters instead of twenty-three The aim of the author has been to subdivide larger chapters of earlier editions of the book "into shorter and friendlier units". In this aim he has succeeded A consistent policy throughout the book has been to use larger type for "basic information" and smaller type for so-called "supplementary information" It is debatable whether this approach is desirable in a text-book which is essentially for students The average student is in doubt as to whether or not to leave out the supplementary material

The book is divided into three main parts.

Part 1 deals with general development and includes chapters on fundamental concepts, reproductive physiology, placentation and experimental embryology and teratology. Part 2 is essentially devoted to organogeny, and Part 3 is in the form of a laboratory manual.

The experimental approach to the pertinent developmental mechanics is admirably dealt with as a separate entity in a chapter on experimental embryology Details concerning developmental mechanics of different organs are also discussed in a brief summary under the heading of "Causal Relations" in the appropriate chapter. In most instances this discussion is useful and valuable, but in others it is much too brief

Part 3 of the book is in the form of a laboratory manual and deals with the embryology of the chick in the earlier stages of development and also with the anatomy of the 10-mm. pig embryo The embryology of the chick is undoubtedly of value in the details which it gives to the student of biology, for the medical student it is much too detailed One would have preferred to have had the anatomy of the 5- and 10-mm human embryos given, instead of that of the pig This section and, indeed, other chapters in the book should have photographs of sections of embryos rather than semi-schematic drawings.

The revision of the book has been carefully carried out The author must be congratulated in producing a readable book of reasonable dimensions in a subject which is rapidly expanding The publishers must also be congratulated on the excellence of the reproduction and the general format of the book

W. J Hamilton

SCIENTIFIC PROGRAMME OF THE INTERNATIONAL GEOPHYSICAL YEAR 1957–58

By PROF. SYDNEY CHAPMAN, F.R.S.

Introduction

THE International Geophysical Year is the name associated with a forthcoming large-scale scientific study of the earth, now being planned and prepared. It will in our generation be the culmination of a long series of such efforts extending from the distant past. In the third century B.C., the Alexandrian natural philosopher Eratosthenes first measured the size of our globe. In A.D. 1600 William Gilbert's treatise on magnetism and electricity announced that the earth itself is a great magnet. Halley's undergraduate astronomical excursion to St. Helena in 1676 to observe the southern stars helped to lead him ten years later to produce the first extensive meteorological chart, of the trade winds. His magnetic voyages in the north and south Atlantic during 1698–1700 bore fruit in 1700 and 1701 by his publication of the first global magnetic charts. In the eighteenth century the French geodesists re-measured the globe by observations in Peru. Early in the nineteenth century Maury applied his studies of the winds to navigation by sailing vessels, and initiated world co-operation in maritime meteorology. Since the second half of that century, international scientific co-operation, particularly in geophysics and astronomy, has developed apace. The first and second International Polar Years of 1882–83 and 1932–33 were organized mainly for arctic observations of magnetism, meteorology and the aurora (the Second Polar Year only, not both First and Second as stated in *Nature* of January 8, p. 55, fell near sunspot minimum); in 1902–3 there was a concentration of scientific effort, on a smaller scale, in the Antarctic. The International Geophysical Year will be a fit successor to these earlier enterprises, far surpassing them in scope and intensity.

The Arctic, the Antarctic and the tropical belt, together with the meridians 70°–80° W., 10° E., and 140° E., will for the Geophysical Year programme as a whole be regions of specially intensive and complete investigation. The meteorologists will add many other special regions for their part of the programme. The effort to be devoted to the Antarctic will be an outstanding feature of the enterprise; no less than twenty-one antarctic stations are planned, which should lead to a major advance in our knowledge of a part of the earth of which in some ways we know less than we do of the moon.

Meteorology

As in the two Polar Years, meteorology will be one of the main branches of the investigation. The range of observation will be global, not only or mainly arctic. In the first Polar Year the observations were made at the earth's surface; in the second Polar Year the atmosphere was explored in height as well as on the surface: the results were signalled by radio to the ground, thus obviating the need for recovering instrumental records from balloons the landfall of which could not be predicted. A major aim during 1957–58 will be to extend this exploration in height over a much greater part of the globe than hitherto, and to higher levels than before—especially in the tropics, where the troposphere is more than twice as deep (there approaching 20 km.) as it is at the poles (about 8 km.). At the standard meteorological stations the plan is to measure the height distribution of air temperature twice daily, and of wind four times daily, up to 20 km., and wherever possible—especially on the Regular World Days (three per month)—up to 30 km.; on these days, when observations are to be specially intensive and widespread, the temperature observations are to be made four times daily.

The main objective will be to study the general circulation of the atmosphere, and the interchange of heat, momentum, angular momentum and entropy between the different parts of the globe. Hence the winds will be specially observed, by radio echoes from balloon-borne reflectors, and also by cloud observations from land and from ships at sea. The meteorological influence of the large-scale topography of the globe—the continents and oceans, and the great mountain chains and massifs—will be investigated. The familiar surface measurements of precipitation, and of air and surface (soil or water) temperatures, will be made more extensively, especially over the oceans; many small oceanic islands will be centres of scientific work of these and other kinds.

Besides the above fundamental measurements, the programme includes more widespread and extensive study of the atmospheric height distribution of ozone and water vapour; of solar and terrestrial radiation (including the albedo of the earth, as indicated by earth radiation reflected from the dark face of the moon); of the high 'mother of pearl' clouds and the far higher luminous night clouds; of thunderstorm regions over land and sea, by radio records of atmospherics; and of the chemical composition of the air, for example, its oxygen and carbon dioxide content in the Antarctic. Rockets will extend the exploration of the atmosphere far above the heights attainable by meteorological balloons.

Under the guidance of the World Meteorological Organization, and with the co-operation of the International Association of Meteorology, instruments and methods of observation and publication will be standardized, and plans made for the handling and discussion of the immense mass of observations thus to be collected. The oceanographic programme of Geophysical Year observation will be an important supplement to the meteorological programme.

Geomagnetism

The chief geomagnetic problems to be solved are those relating to magnetic storms—long studied, but never with an adequate network of observatories. During 1957–58 the network of regular observatories will be enhanced, and be valuably strengthened by magnetic recorders installed at many ionospheric (and perhaps also cosmic ray) stations, for their own purpose of gaining early awareness of magnetic disturbance. The methods and instruments will be similar, in the main, to those used during 1932–33,

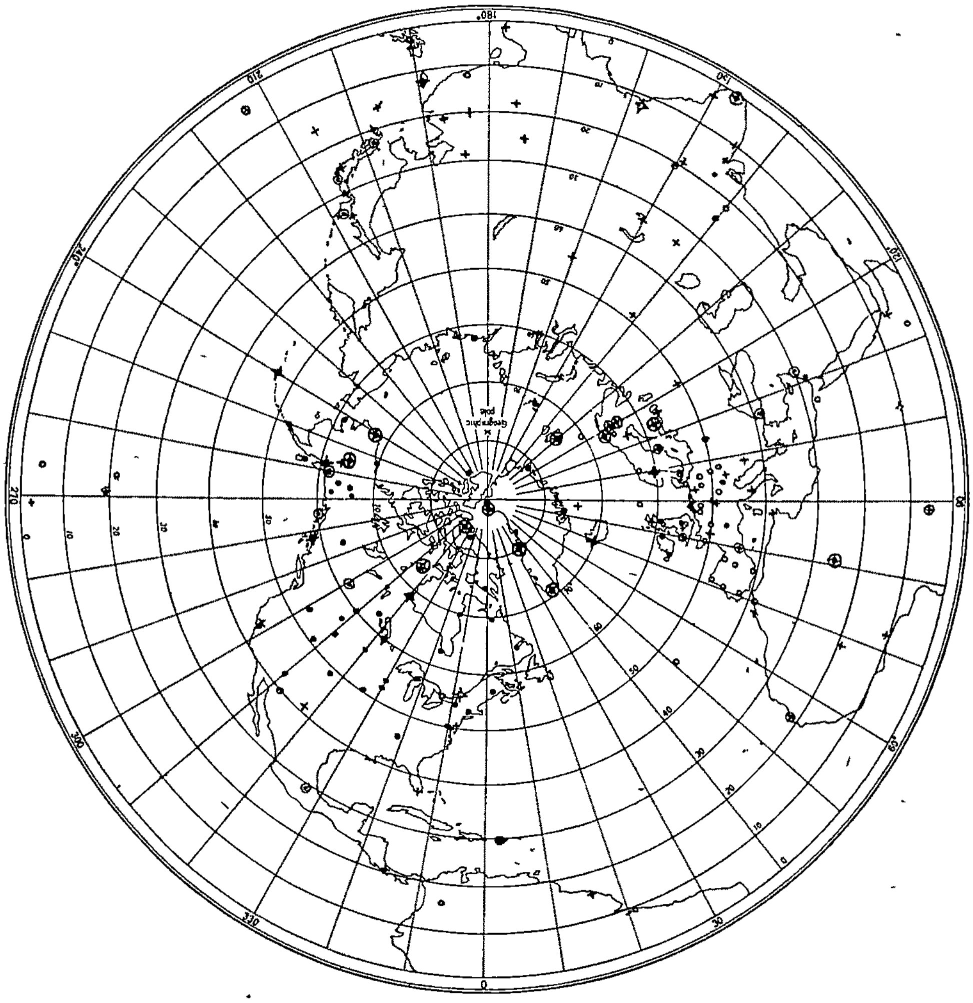

Fig 1 Observation stations in the northern hemisphere for the International Geophysical Year auroral stations ●, ionospheric stations, +, magnetic observatories, O The southern hemisphere will have fewer stations Geomagnetic co-ordinates

but at some stations in or near the auroral zone the space gradients of the magnetic field will be measured, by setting up two satellite sets of recorders some miles distant, one to the north or south, the other to the east or west, these satellite stations, near enough to be managed by the staff at the main station, will, it is hoped, contribute materially to our knowledge of the intense systems of electric currents in the arctic ionosphere These currents will also be explored in more detail, and closer at hand, though only for a few brief intervals of time, by magnetometers carried into or near them by rockets launched in high latitudes during magnetic storms.

Special care will be taken to avoid loss of record (such as occurred all too often in the past) during any very great magnetic storms that may befall during 1957–58

The concentration of daytime electric current over or near the magnetic equator will be more fully observed by an increased number of tropical magnetic observatories.

Improved and more extensive recording of magnetic pulsations, and also of earth currents, will be further important features of this part of the programme. As a contribution to the correlation of geomagnetic with other data, it is expected that indices of geomagnetic activity will be made available for each quarter-hour throughout the Geophysical Year, instead of, as now, for each three-hour interval.

The Aurora

The International Geophysical Year is too brief an interval to afford much improvement in the long-range statistics of auroral frequency, but it should mark a great advance in the observation of the many auroræ that may be expected to occur during the Year. In the regions where auroræ are often visible, at geomagnetic latitudes 60° and more, there will be a network of auroral stations equipped with automatic cameras that will photograph the whole sky every five minutes throughout each night, these will afford a synoptic view of the terrestrial extent and of the changes of auroræ never hitherto realizable. (Incidentally, this may also provide valuable data concerning cloud cover) At some of these stations there will be automatic scanning spectrographs giving a succession of spectra of the auroral light in the vertical meridian plane, over nearly the whole arc from horizon to zenith to horizon. In rather lower geomagnetic latitudes, where auroræ are less often visible, there will be a few stations similarly equipped, and there will be networks of visual observers, including some on sea as well as land, some equipped with angle-measuring devices, and with filters to isolate different spectral bands of the auroral light (thus cutting down the background sky light, especially during twilight and moonlight), some stations may have colorimeters designed to record the nature of the auroral light less elaborately than by spectrograph Air pilots will take part in such visual observation, with special benefit when the sky is overcast. It is hoped that the network of careful visual observation will be extended into low latitudes, where the work should be much aided by the world system of warning of expected magnetic disturbance, professional, volunteer and other aid from meteorological and other organizations will especially be sought in these regions of lower latitude A watch will be kept for the simultaneity of appearance of auroræ at the two ends, northern and southern, of a line or lines of geomagnetic force, or at pairs of stations in nearly the same geomagnetic longitude, and nearly equal northern and southern geomagnetic latitudes The possibility of such observations is determined mainly by the availability of sites for fixed stations in high southern geomagnetic latitudes. For example, Macquarie Island (54 5° S, 159 0° E. geographic, 61 1° S, 243 1° E geomagnetic) could be paired with an Alaskan station to the south-west of College, Alaska, and Heard Island (53 0° S., 73 4° E, 61 2° S, 129 9° E) could be paired with a north Siberian station. Means of intercommunication between such pairs of stations would be useful though not essential.

Some radio observatories will explore the auroral regions by short-wave beams echoed back to the station by suitably placed auroræ, by this means auroræ can be detected and located from a considerable distance, independent of cloud cover, and by day as well as by night Any radio waves emitted from the aurora itself will also be registered

Measurement of the increased scintillation and absorption of the radiation received from radio stars, when it passes through an auroral region, will be another and novel means of study of the enhanced ionospheric turbulence and ionospheric drifts associated with auroræ

Special spectrographic studies will be made of the Doppler effect in the light of the hydrogen atoms which rush downward along the auroral rays and are scattered in all directions near the base of the rays. These or accompanying electrons will be detected and counted by ionization chambers borne by rockets launched from balloons

The Airglow and the Zodiacal Light

All over the globe the upper atmosphere emits light, the airglow, which in general is too faint to be visible to the eye or to be photographed directly with short exposure, though sometimes patchy, it does not have the definite forms generally shown by the aurora. It is enhanced at twilight, and is observable also by day from rockets high above the atmospheric layers where the beam of solar radiation is scattered to give the general sky light Its geographical distribution, changing with time of day and with season, will be investigated during the Geophysical Year, by means of scanning photoelectric photometers sensitive to four or more spectral bands of the radiation These instruments, which automatically survey the entire sky each half-hour, will be disposed at intervals along a meridian chain, beginning at Thule, Greenland, and, crossing the auroral zone, extending through Canada, the United States and Mexico, others will be in Alaska, Hawaii and the Belgian Congo Less complicated photometers, recording or visual, will be placed at further stations, the observations will necessarily measure, besides the intensity of the airglow, that of the auroral light, when present, and (in low latitudes) the zodiacal light All these photometers will be carefully calibrated by astronomical methods or by the use of fluorescent surfaces activated by radioactive material of long life.

In addition, spectrographic and interferometric studies of the airglow will be made at a few special stations, and some high-level spectral observations will be made from rockets Such studies will deal in detail with the various components of the spectrum of the airglow, its green and red atomic oxygen lines, the oxygen (and possibly nitrogen) bands, the yellow doublet of atomic sodium, and the strong infra-red and other radiations of the hydroxyl molecule OH.

Cosmic Rays

As for the airglow, so also for cosmic rays, the Geophysical Year will be the first occasion on which a prolonged simultaneous standardized scheme of world-wide observation will be operated. Two main types of instrument will be used in this survey, one a counter telescope to record rays of relatively high energy, the other a neutron monitor for the low-energy part of the cosmic-ray spectrum. The ionization-chamber counters already in operation at several stations should continue also throughout 1957–58. Detailed indications of the construction and operation of the two standard types of instrument will be made available in good time by the Geophysical Year Sub-Commission of the International Union of Pure and Applied Physics. It is hoped that the synoptic network will include sixty or more stations disposed in the special Geophysical Year areas (zones and meridians) and elsewhere, many of the instruments may be located at meteorological, magnetic or ionospheric stations

As in other branches of the Geophysical Year work, plans will be prepared for standardized forms of recording the synoptic observations, for interchange of observations between stations, and for publication

Additional special cosmic-ray investigations are planned, including moving photographic-emulsion records of the heavy-particle component, and high-altitude observations to determine the momentum spectrum, from mountain stations, aircraft, balloons and rockets But the main emphasis of the cosmic-ray programme will be on the investigation of geomagnetic, aeronomic and solar problems to which cosmic-ray observations may be able to make a distinctive, perhaps unique, contribution

The value of these observations will be greatly enhanced by the unprecedented array of solar and geophysical data available during the Geophysical Year

Solar Observations

The Geophysical Year will be at or near a sunspot maximum which is expected to be of considerable but not exceptional intensity Because so many geophysical phenomena are related to solar activity, it is hoped that this will be continuously observed in the several different ways now possible. To this end, the observing hours at solar observatories will be extended in order to give an overlap of the periods of observation at stations in different longitudes, so that spells of cloudy weather at one or other station may not break the continuity of record. The long-continued records of sunspot numbers, their positions and areas, of prominences and faculæ, will be supplemented by spectroscopic, spectrographic and photographic observations of solar flares, by spectrophotometric observations of the inner corona, and by records of solar radio emissions and their polarization, at a series of wave-lengths. Interferometric studies of the location of the radio sources will be made. Further, rocket spectra of sunlight at successive high altitudes will be photographed at intervals throughout the Geophysical Year.

Some solar observatories will equip themselves with recorders of atmospherics, which can give visual indication or audible warning of the beginning of solar flares, because of the improved propagation at such times. This will enable special observations to be made outside the normal 'solar patrol' periods.

The distribution of the line-of-sight component of the magnetic field of the sun will be mapped over the solar disk two or three times a day, by the Babcock method, at Mount Wilson and perhaps also at other solar observatories.

The solar observations during the Geophysical Year will be of cardinal importance to the scheme of world notification of Alerts and Special World Intervals, at times when magnetic, auroral, ionospheric and perhaps also cosmic-ray disturbances may be expected. Solar data as complete as possible will be vital for the detailed study of the sun's influence on magnetic, auroral, ionospheric, cosmic ray, and perhaps other data to be obtained during the Geophysical Year.

Ionospheric Investigations

The pioneer arctic ionospheric investigations made during the second Polar Year were the most important extension of the programme of that enterprise, as compared with the programme of the first Polar Year. The fledgling of that epoch is now grown to be a major member of the Geophysical Year programme. More than a hundred stations for the exploration of the ionospheric layers overhead, by vertical beams of pulsed radiation, are expected to be in operation during the Geophysical Year; their distribution will in large part conform to the general plan of concentration along particular zones and meridians; but the considerable influence exerted on the ionosphere by the geomagnetic field will be taken into account by siting some stations with special reference to geomagnetic latitude, that is, to latitude relative to the axis of the main (dipole) component of the earth's field, with its north geomagnetic pole at 78·6° N., 70·1° W. (1945).

This now standard method of ionospheric investigation, from fixed stations and also from aircraft, will enhance our knowledge of the complex and changing structure and disturbances of the ionosphere, from the equatorial to the auroral regions. In addition, many special studies will be made, at fewer stations: of tropospheric propagation, of absorption, of ionospheric drift, of both back and forward scatter, of radio star scintillation, of atmospherics, of auroral and solar radio noise, of radio echoes from meteors and auroræ. There will also be direct exploration of the ionosphere, *in situ*, by rockets. The fulfilment of these plans should gather a rich harvest of aeronomic observations for study in association with solar, magnetic, auroral and airglow data. The ionospheric prediction stations in association with the solar observatories will play a vital part in the plan for World Alerts and Special World Intervals.

Longitudes and Latitudes

In the past there have been two world-wide determinations of the longitude differences between major astronomical observatories; the later one was in 1933. During the Geophysical Year, both the longitudes and latitudes, and the variations of these quantities, will be determined. This will lead to improved measurement of time, more precise determination of the irregularities of the earth's rotation, and corrections to star catalogues. The participating observatories will be those associated with the Bureau International de l'Heure, and, it is hoped, others newly organized and equipped, in areas where there are great gaps, especially near the equator and in the southern hemisphere. New types of fundamental instruments will be used.

In addition, a new method will be applied to determine the mutual relation of the geodetic networks covering the continents, by frequent photography of the moon against the background of stars, from about twenty well-distributed observatories; by this technique it is expected that the uncertainty of the extent of the oceanic gaps separating the networks will be reduced from 200–300 ft. to about 100 ft.

The availability of the great store of meteorological and ionospheric data to be obtained during 1957–58 will materially assist these undertakings.

Glaciology

The extent, character and behaviour of glaciers and snow cover will be measured in many parts of the world; this simultaneous survey will be far more geographically comprehensive than any made hitherto, and will be of great importance to meteorology and climatology. Apart from direct measurements at or from fixed stations, air reconnaissance will be used. Fixed survey points will be set up on selected glaciers in order that changes may be adequately determined by future comparison with later observations.

One great objective is to investigate the ice morphology and measure the total ice content of Antarctica. In this plan the co-operation of American, Australian, French and perhaps other nations is hoped for. It is anticipated that, with the aid of special aircraft, widespread seismic surveys will be made to determine the thickness of ice over the whole continent, and to settle the geography of the coast under the ice cover. This survey has special importance for the long-term climatological prediction of sea-level changes. The limits of permanent ice—a matter of present interest and valuable for comparison with future surveys—should be charted with considerable accuracy.

Oceanography

Many great problems of the oceans, especially in the southern hemisphere, await solution. Several ocean survey vessels belonging to the United States, Britain, West Germany and other nations will work on a co-ordinated plan during 1957–58. The water circulation, sediments and crustal structure will be studied along two meridians, and the measurements will include water velocities determined electromagnetically, and the heat exchange between sea and air, as well as the customary temperature, salinity and other standard measurements. About forty new stations will be set up, equipped with tide gauges and non-tidal long-wave recorders, on many islands and on some continental coasts The shifting boundary between temperate and arctic waters, and the warming of the Arctic, will be studied. Continuous echo sounding, registration of magnetic intensity by towed instruments, collection of plankton by towed nets, radiocarbon sampling of the deeper waters, measurement of temperature gradients in sediments, collection of long sediment cores, and seismic reflexion observations will be among the activities of some of the oceanographical ships, these will also be available, so far as possible, as moving 'stations' for other types of geophysical observation.

Seismic and Gravity Measurements

The Geophysical Year will provide opportunity for seismic recording and gravity measurements to be made at many antarctic and island sites not ordinarily accessible or available, and it is expected that many expeditions will include such work in their programme.

The Rocket Programme

Rockets provide the most important new technical feature that distinguishes the Geophysical Year from the second Polar Year. They will enable the atmosphere to be explored over a much increased range of height in various ways, and may considerably extend our understanding of upper atmospheric processes and our knowledge of solar phenomena that affect the earth The technical advances that are involved concern not only the rockets themselves, but also the measuring devices they carry The measurement of atmospheric properties by instruments travelling at high speed presents difficult problems During the past decade American scientists have made remarkable progress towards their solution, and the tide of invention in this field continues to flow strongly.

In most of the upper-atmospheric rocket researches thus far made, large and very expensive rockets have been used, launched from a desert site in New Mexico, with costly ground installations. The smaller rockets of this type can be, and have been, launched also from specially fitted ships Recently, however, a much cheaper method of rocket exploration has been developed by Van Allen and his colleagues. The rocket is carried up to a considerable height by a large balloon, and launched at a predetermined pressure-level. The launching heights have ranged up to 27 km, and the heights attained have at times exceeded 100 km The load that can be carried up to about 100 km is 15 kgm, which permits a wide variety of researches, such as those on cosmic rays, ozone, pressure, density and temperature, the solar spectrum, the sky brightness and airglow, geomagnetism, auroral particles, and ionospheric physics The combined rocket–balloon system is called a 'rockoon'. Investigations are in progress into the vertical launching of rockets from aircraft, and if successful may contribute to the Geophysical Year programme

The American National Committee for the Geophysical Year plans to fire approximately thirty-six large rockets ('Aerobees') and about a hundred rockoons, distributed throughout the period, and also geographically, from the Arctic to the Antarctic. Many of the above researches, if not all, will be included in the programme The French National Committee plans to launch twelve of the large French rockets ('Véronique') from the Sahara, in pairs, at intervals, their instruments are expected to measure pressure and density, ionization, solar radiations, and particle masses (by mass-spectrograph). It is greatly hoped that other nations will also contribute to the rocket programme.

Problems of Organization and Finance

The achievement of the Geophysical Year will depend on the effort and funds devoted to it by the different participating nations Naturally, their contributions will be unequal in magnitude and kind, help will be afforded by some nations to other nation-partners in the enterprise, by provision of instruments, training of observers, reduction of observations and in other ways. The unprecedented volume of observations that will accrue will present problems of collection and discussion for which detailed plans are not yet made. Many important points as to methods and recording of observations, and standardization and calibration of instruments, await settlement Some important nations have still not associated themselves with the Geophysical Year. Thus there remains much scope for effort and thought in order to render the enterprise as successful as possible. But the stage already reached, more than two years before the Year begins, is good ground for confidence that the scheme will far surpass every previous co-operative scientific effort of its kind, and that it will lead to notable advances in knowledge of importance and interest to mankind. When the Geophysical Year ends, the level of activity in geophysical observation will necessarily drop rapidly and considerably, but past experience indicates that the subsequent level will still mark a distinct rise above the present level; thus it will afford a higher stage from which at some later epoch another International Geophysical Year can mount to yet greater heights and intensity.

A PATTERN FOR INDUSTRIAL RESEARCH

In 1953, seven senior executives of the United Steel Companies, Ltd., were invited to lecture to engineering undergraduates in the University of Cambridge on various aspects of industrial management. The lectures have now been presented in book form*, and among them is a valuable contribution to contemporary thinking about the organization and application of scientific research in industry by Dr. J. H. Chesters, assistant director of research to the Company

The research worker in industry spends a good deal of time on development work that adds little to scientific knowledge, on the other hand, his best achievements are often based on fundamental data which he himself has collected or been able to appreciate and apply.

---

* Industrial Management a Course of Lectures given at Cambridge University for the Faculty Board of Engineering Pp 124 (Sheffield United Steel Companies, Ltd, 1954)

The usefulness of a research department depends primarily on the originality, initiative and effort of the staff, but the framework within which research workers function greatly influences the results

The research department may vary from one man to giant organizations, such as Bell Telephones, which must be considered as plants in themselves and indeed, in the United States, are registered as separate companies. In Great Britain there is wide variation (0 4–5 3 per cent) in the research and development costs expressed as a percentage of turnover in different industrial groups In the scientific instrument and light electrical engineering industries the figure is more than 5 per cent, in chemicals 2 4 per cent, whereas for the ferrous industry and for food, drink and tobacco it is only 0 4 per cent In general, the older the industry the less is its present investment in research. One reason for this is that iron and glass can be made, and indeed have been made, without any precise scientific knowledge, but radio sets would not even have been thought of unless a great deal of fundamental research had been done

A research unit consisting of a university graduate backed up by two assistants can be run for an average expenditure of £3,000 per annum In the United States, industrial research activities account for less than a half per cent of the cost of goods and services of the undertaking

Research in the United Steel Companies costs approximately a half per cent of all sales. There is a total staff of almost two hundred, who study all the major aspects of iron- and steel-making in metallurgy, engineering, physics, chemistry, mathematics and geology.

The possession of a first- or second-class honours degree is by no means the sole criterion in the choice of an industrial research worker. The ability to work in a team has long been recognized as equally vital, the isolated research worker being now something of a curiosity. The old vertical-type team consisted of a section head with his senior and junior assistants The new type team—which is of a horizontal character and requires the fullest co-operation between different section leaders and their staffs—calls for an even higher conception of team-work

The efficient use of specialists demands that they be supported by other workers who do not require to be as highly qualified. In the United Steel Companies about a hundred university graduates and men with equivalent qualifications are backed up by more than a hundred other members of staff, many of whom left school when they were sixteen, but have since acquired considerable skill in some particular field of activity. The old idea of 'lab. boys', who often finished in blind-alley jobs, is rapidly dying out

The senior staff, too, are encouraged to continue their studies and to join appropriate scientific or technical societies By so doing they not only increase their background of knowledge, but also get the opportunity of 'sparking' their minds on those of workers in other fields

Considerable experience now exists on the building of research departments, and such elementary mistakes as putting dirty and clean work adjacent to one another, or heavy machinery near equipment requiring freedom from vibration, rarely occur Where a new laboratory replaces an old one certain new problems arise, notably the clash between the desire to have a smart modern laboratory and to do work that can be far more efficiently carried out if a certain amount of mess is permissible The best, though still imperfect, answer would seem to be the segregation of 'dirty' activities in either a separate block or outbuilding

Another risk with new and impressive laboratories is that the worker is less inclined to use the 'string and sealing wax' technique Unless encouragement is given to start with rough equipment there is a tendency for the research man not to start his experiments at all until he has designed what he considers to be a good-looking piece of equipment. Far quicker results would be obtained and much money saved if at least early work is done with a crude assembly, and this only converted to an engineering job where accuracy or long-term use demands

The jobs tackled in an industrial research department can be conveniently divided into those which arise internally and those arising from external demand The latter may come direct from the plants or arise from long-term policy laid down by high-level management or the numerous technical committees that form so valuable a part of large-scale industry.

External demand is not, of course, limited to the works, it includes the demand by customers for materials to meet more arduous service conditions or for the solution to a problem that is difficult to solve by engineering means. An example of the latter was the joining of austenitic and ferritic tubes, the different coefficients of expansion of which would affect the tightness of a bolted joint, or the stresses in a plain butt weld in conditions of fluctuating temperature An appreciation of the desirable characteristics of such a joint in service and the potentialities of an extrusion press in producing the necessary conditions for making a pressure weld enabled a tubular transition piece to be evolved which consisted of a ferritic tube gradually tapering to zero thickness inside an austenitic tube increasing at the same rate from zero to the full tube thickness

At least a third of the solution to a problem lies in stating it correctly, research work often suffers because the true nature of the problem is not appreciated before the work began. A close examination at the start may even show that the problem does not really exist, is trivial, or such that a solution would yield little benefit. In the United Steel Companies all major items of work in the research department are covered by means of investigation sheets, which state in a few paragraphs the nature of the problem, the method by which it is to be tackled, and a list of the plants expected to benefit if a useful conclusion is reached

Most research departments carry more investigations than they are really capable of handling. This leads to double dissatisfaction, the user being depressed because his problem gets little attention, and the research worker annoyed because he is perpetually asked to report on investigations on which he has done no work for some time A rough rule is that the number of investigations in a section should not exceed that of the staff.

It is a tradition with research workers that they commence an investigation by searching the literature. The industrial worker rarely has time to do so at all fully, but can be greatly aided by an information section which keeps him continually informed of developments in his field, and can cover a far wider range of literature than he can ever hope to do by his own specialized reading

Speed is frequently vital in industrial research. There are occasions when, to be of value, information must be provided within a day. If the research organization is sufficiently flexible, such demands can sometimes be met. The research department was once asked at 9 a.m. whether the collapse of a new steel furnace roof was due to poor brick quality or to operating procedure. The roof had to be replaced that night, and any answer after 5 p.m. could not affect policy for the next furnace campaign. By switching all the staff of the refractories section to the problem, all the standard properties of the suspect-bricks were determined and a report issued over the telephone at 5 o'clock to the effect that there was nothing wrong with them and that the same quality should therefore be employed in the new furnace. The subsequent behaviour of the furnace showed this to be the right decision.

The object of research should be the provision of genuinely new information in which is included quantitative research hitherto only understood qualitatively. The results obtained may at first prove unpalatable, because they conflict with previous assumptions.

From the practical point of view, a result opposite to that anticipated frequently proves to be of value. As an example may be cited war-time troubles with induction furnace linings, due to the loss of the previously used Austrian and Greek magnesite. At the time and on an apparently sound theoretical basis, it was believed that the ultimate test for induction furnace lining materials was their ability to withstand high temperatures without shrinkage—shrinkage cracks being thought to lead to metal penetration and a consequent strike to the high-voltage water-cooled coil. This hypothesis was overthrown by the results of laboratory tests on a wide range of linings, which showed that the satisfactory ones frequently had a high shrinkage when heated to 1,600° C., while those that failed mostly showed a low shrinkage.

A large proportion of the more important developments arise from accidental observations. This was seen in the metallurgical field by work on boron, which was added among other materials to 0.5 per cent molybdenum steel to prevent the cracking of steam pipes. It was noted that the boron–molybdenum steel had twice the proof stress of mild steel and yet possessed similar weldability. Realizing that such a steel would be of great value in reducing the weight of engines and structures, its properties were thoroughly investigated and this led to a valuable contribution in aircraft gas turbine design, and the provision of light-weight structures generally.

Assessment of a job frequently indicates that an efficient attack requires the cutting across of section boundaries. Development of a new-type furnace, for example, may demand co-operation with those concerned with such primary aspects as flow pattern and combustion on one hand, and design and development engineers on the other, the latter putting an engineering interpretation on what may have started as a rough sketch.

It is often assumed that such co-operation should be easy with scientific workers, since they are solely concerned with the discovery of truth. In actual fact, they are just as liable to be upset if credit goes elsewhere for work they have done. The techniques for ensuring that credit in team-work is given where it is due are still very much in the evolutionary stage. One method is the symposium, in which the various contributors are given a place that is at least roughly related both qualitatively and quantitatively to their own contribution to the work.

Industrial research departments can be classed into those which like to keep everything secret and those which are willing to talk of almost all the work they have in hand. It is the latter approach which will ultimately survive, since the willingness to give generously of information without guarantee of return seems essential to healthy development.

Good reports of research are essential, since they are the foundation of future work; the research worker must be prepared to finish his report with clear and concise conclusions and recommendations. Most young research workers, and some older ones, object to writing a report until the work has reached a stage where they feel they can give a full answer to the problem. The result is that the practical man is starved of information for long periods, while the research worker frequently gets so involved in his deliberations that he ceases to see the problem at all clearly. The right answer to this difficulty would appear to be the issue of interim reports. Sometimes, it is desirable to follow the series with a summary report in which the chaff can conveniently be separated from the wheat. Moreover, if the research worker is incapable of putting his discoveries into simple language, it may well be because he does not really understand what he has found out.

On costs the research director should be given a reasonably free hand. "How do you *know* that research really pays ?" is by no means an easy question to answer, particularly where research is mainly concerned with the improvement of a product. Where it deals equally with production processes, however, it is frequently possible to show that the savings associated with quite a small number of investigations are of such a high order as to leave no doubt whatever regarding the overall economics of the research department.

The research director's attitude to patents will be greatly influenced by the type of work done in his department, and also the general policy of the company. Some firms publish little, but take out many patents, others have few patents but publish almost everything. It is often doubtful whether the benefits gained are not more than offset by the trouble and expense involved.

There is still much to be learned about the technique of applying scientific ideas in industry. The major problems are more often psychological than technical, and the ability to tackle them depends more on the personality of the individuals concerned than on their academic achievements. Wherever possible, those likely to use the results should be in touch with the research work as it proceeds, starting sometimes to apply to new ideas before any report is issued.

It is frequently found that the economics of a procedure suggested by research can only be assessed on the plant itself. This means that large-scale trials must be organized and data collected which will enable costing to be done. Where the industry is of a type that owes its origin to scientific research, like chemicals or electronics, such trials present few psychological difficulties.

In the older industries the position is very different, there being a conscious or unconscious struggle between the craft of the 'witch-doctors' and the new ideas of the 'backroom boys'. Between these extremes lies a wide field for diplomacy, the need of the scientific worker for more precise information on plant performance being balanced against the extra worries which such trials place on works staff

Sometimes the application of a new idea or device is delayed because of a natural desire on the part of production executives to see whether it operates successfully elsewhere before committing themselves to major expenditure In such cases, trials on small units can often speed application to larger units A good example of this was the application of a metallic recuperator to reheating furnaces. A new design, developed abroad, was felt to be promising, but lack of previous experience caused hesitancy in applying it on new soaking pit furnaces. The construction and exhaustive testing of a small recuperator attached to a works' furnace gave results which were sufficiently promising to lead to large-scale applications both in the United Steel Companies and in other industries.

OBITUARIES

Miss M S Johnston

Miss Mary Sophia Johnston, second daughter of the Rev. W. A. Johnston, rector of Acrise, Kent, was born at Folkestone on October 29, 1875, but spent the greater part of her life first at Wimbledon and then at Kew, Surrey. She became keenly interested in geology as a girl and very soon established her position among the amateurs in days when women geologists were few. Her interests lay mostly in stratigraphical and physical geology, and it was on an aspect of these that she wrote her best-known paper (with the late Miss M C Crosfield) on "The Ballstone and Associated Beds in the Wenlock Limestone of Shropshire".

Until age somewhat curbed her strenuous activities, Miss Johnston was a constant and energetic participant in the field meetings of the Geologists' Association (which she joined in 1898), while she had field experience of foreign geology at several meetings of the International Geological Congress, at the Toronto meeting of the British Association, and by travel in Egypt On all these occasions she collected assiduously Thus she built up a remarkable collection, which was always at the use of students and which she presented ultimately to the nation and to various universities She wrote on some of her observations abroad, and also lectured extensively about them

Miss Johnston had a life-long interest in archæology and heraldry, and compiled historical pamphlets on Richmond (Surrey) and Kew.

She was proud of being one of the first, small group of distinguished women elected as Fellows of the Geological Society of London in 1919. She served as an officer of the Geologists' Association for twenty-one years (and was made an honorary member in 1939), on the Council of the Palæontographical Society, and as treasurer of the South-Eastern Union of Scientific Societies She was a fearless but very fair critic on committees, where she displayed a fine sense of financial rectitude

Her scientific friends knew Miss Johnston as an ever-helpful and charming personality It was left to those more intimate with her to know of her generosity to Kew churches and of her valuable work for youth No account of her would be complete without reference to the active benefactor she was to one of the Richmond boys' schools and to various tradesmen's rowing organizations. She was also an officer of several of the latter and guided them wisely for many years (in one case she was honorary treasurer for more than twenty-seven years until her death).

Miss Johnston maintained her activities and interests to the last, and her death, after a short illness, on January 23 was a shock to her many friends H. Dighton Thomas

Mr Eric Parker

From his schooldays at Eton until his death on February 13, Eric Parker was able to enjoy his love of the countryside. When he could no longer get about on foot, he drove himself around his beautiful garden at Feathercombe, near Godalming, in his electrically propelled chair. His last book, "Surrey Gardens". was published a year ago, and to gather material for it he visited eighty-four gardens

Though he wrote so much on shooting and fishing, the pleasure he got from sport took second place to his interests as a naturalist. His eye was attracted by the detail of all around him the water rat biting off the head of a lily, martins flying south as high as he had ever seen them, on a warm westerly wind in October, the change in the song of a bird, the wild-flowers of the hedgerow

Before he joined the staff of *The Field* in 1910 to take over the shooting from James Harting, he was writing prolifically, at one time for *The Field*, *The Spectator*, *The County Gentleman*, *The Gamekeeper*, which he edited, and *The Cornhill Magazine* At the time when he was editor of *The County Gentleman*, he formed a great friendship with Anthony Collett, for whom he did the illustrations to "British Inland Birds"

Parker never accepted any statement lightly, and this led him to analyse the observations of the early writers on natural history and to compare them with those of recent naturalists and his own He experimented with a bow and arrow to reproduce the drumming of the tail feathers of a snipe. He held the belief that the drumming of woodpeckers is vocal, and in his "World of Birds" he gives accounts of trials he made to prove it and presents the case for and against his own conviction He neither feared controversy nor failed to attack practices he condemned, as in his "Ethics of Egg Collecting" He hated any form of cruelty. He was opposed to tail docking of horses and dogs, and it was mainly due to his attack on the caged-bird sellers of Club Row that the traffic in wild birds was stopped But he had no room for false sentimentality, and in 1931, after he had become editor of *The Field*, he organized a committee to consider measures to be taken against the spread of the grey squirrel

To the Lonsdale Library, which he edited, Parker contributed much, including the volume on "Game Birds, Beasts and Fishes". The many books he wrote at his table before the window through which birds flew in to the food tray were in the purest and simplest English. Anyone reading the 'week-end' books alone could add much to his general knowledge.

On the day of Eric Parker's funeral an incident occurred which it would have given him pleasure to watch. Two of his grandsons saw a field mouse by the roadside which the youngest one gently handled and released R N. Rose

NEWS and VIEWS

The European Organization for Nuclear Research Director-General

Prof. F Bloch is resigning from his appointment as director-general of the European Organization for Nuclear Research as from August 31, and will be succeeded by Prof C J Bakker, professor of physics in the University of Amsterdam Prof Bakker was born in 1904 and studied physics under Zeeman in Amsterdam In 1931 he took his doctorate (cum laude) for research on the Zeeman effect in the spectra of the noble gases. After this he spent a year in London at the Imperial College of Science and Technology, continuing his work in the field of spectroscopy In the following year he became a member of the scientific staff of Philips of Eindhoven, where he did research on certain physical problems in relation to radio However, his interests turned to nuclear physics, and during the War, in collaboration with Prof. Heyn, he started designing a cyclotron for Philips In 1946 he succeeded Gorter as professor of physics and director of the Zeeman Laboratory of the University of Amsterdam He also became director of the Institute of Nuclear Physics, the focal point of Dutch nuclear research

Progress Medal of the Royal Photographic Society: Dr. Julian H Webb

Dr. Julian H Webb, of the Research Laboratories, Eastman Kodak Company, Rochester, N.Y, has been awarded the Silver Progress Medal for 1954 of the Royal Photographic Society for an outstandingly important series of studies of the photographic process extending over many years By a combination of theoretical argument and experiment, he has established some of the fundamental facts which must be accounted for by any theory of formation of the latent image, and followed this by important contributions to the main body of the theory of sensitivity which is accepted to-day, including one of the first discussions on modern lines using the wave-mechanical theory of crystals He has also made investigations of great value into the connexions between the sensitivity properties of single grains and the *H.* and *D.* curve of photographic materials

Felice Fontana (1720–1805)

Felice Fontana, who died at Florence one hundred and fifty years ago on March 9, 1805, was a versatile scientist who made many original contributions to anatomy, histology, botany and toxicology. He was born on April 15, 1720, at Pomarole, near Rovereto, in the Austrian Tyrol, and studied at Verona, Padua and Bologna While he was professor of philosophy in the University of Pisa, he made a favourable impression on the Grand Duke of Tuscany, later Holy Roman Emperor Leopold II, who offered him the directorship of the Natural History Museum at Florence This Museum housed the finest anatomical collection known at that time, including the world-famous coloured wax preparations modelled after Mascagni's dissections. Fontana's observant and creative mind expressed itself in many scientific pursuits As a botanist he made a careful study of the rust of grain and of spurious ergot. As an ophthalmologist he described what is to-day universally known as Fontana's canal or space As a histologist he was one of the first to recognize the cell nucleus, the tubules of the kidney, and the nerve sheaths. As a toxicologist he investigated the actions of opium, of prussic acid and of snake poisons His book, "Ricerche fisiche sopra il veleno della vipera" (1767), is a landmark in the study of serpent venoms. As a chemist, he found that carbon absorbs gases (this was afterwards confirmed by Priestley), and as a clinician he invented an apparatus for administering oxygen in phthisis Fontana died at the advanced age of eighty-five and was buried in Santa Croce, Florence's Pantheon

'Heavy Water' Project in New Zealand

A company known as Geothermal Development, Ltd., in which the New Zealand Government and the United Kingdom Atomic Energy Authority are the sole shareholders, has now been incorporated This is a joint enterprise to undertake the construction of a factory and the subsequent production of heavy water and electric power from geothermal steam in the Wairakei district of North Island, New Zealand. The project has been under prolonged study by scientists and engineers in New Zealand and in the Atomic Energy Research Establishment at Harwell, in collaboration with Messrs. Merz and McLellan (consultants to the New Zealand Government on electric power) and Head Wrightson Processes, Ltd. (consultants to the Atomic Energy Research Establishment on heavy water), and last year a British mission including a number of scientists from Harwell went to New Zealand to discuss details. Geothermal Development, Ltd, is to have a nominal and paid-up capital of £30,000, one-third of which is to be provided by the Atomic Energy Authority and the rest by the New Zealand Government. The remainder of the capital requirements of the Company will be provided by loans, those for the heavy-water plant (estimated at £2,000,000) are to come from the Authority and those for the electric power equipment (estimated at £4,000,000) from the New Zealand Government The board of directors comprises three representatives of the New Zealand Government and two from the United Kingdom Atomic Energy Authority, and Dr E Marsden, a former head of the New Zealand Department of Scientific and Industrial Research, will be associated with the Board It is envisaged that production of heavy water will begin late in 1957 and of electric power a few months later. Initial plant will produce electric power at a rate of about 40,000 kW, and a useful tonnage of heavy water for nuclear power reactors. The Authority undertakes to purchase from the company the whole of the output of heavy water, and the New Zealand State Hydro-Electric Department the whole of net electric power available. Boring and development work at Wairakei have already begun.

Observations on the Palolo Worm of the Pacific

The palolo worm of Polynesia and Melanesia has always been of intriguing interest to naturalists because of its so-called 'lunar periodicity', which is due to a rhythmic productivity of such consistency that spawning occurs each year in the month of November, always on a day or so following the full moon Mr C. Sorenson has observed the phenomena many times at Tokau Reef, Ovalau Island, Fiji. He describes in the *Australian Museum Magazine* (11, No 6, June 1954) the brown-coloured scum suggesting an exudation from the hidden worms in the coral rock which appears in patches three to four days before the actual spawning. When this washes ashore and concentrates along the water line, it emits a sickly decaying odour, which can be detected a hundred or more yards away. While the scum is present, the native population avoids eating red-coloured reef fish and trevally, as well as certain surface fish, including the local barracuda Often before the main spawning there is a minor event, when broken lengths of the hind parts become swollen with the reproductive elements and break off from the main body of the worms At Ovalau Island there are regularly two risings of the worms each year, and at the second, or major, one the shallows over the reef contain masses of worms two to three feet deep in dense patches which are acres in extent The phenomenon occurs between 3 and 4 a m , when the massed worm-lengths rise out of the coral rock in thick rope-like columns , at this stage individuals may be up to two feet long, but soon after reaching the surface they break up into shorter lengths, and final complete disintegration, death and putrefaction follow soon after the coming of daylight and the rising of the sun The local inhabitants await the event with great eagerness and collect the worms literally in tons with every kind of utensil that is suitable The catch is considered a great delicacy and is usually boiled, though some is eaten raw While it is usual for only two risings of palolo worms to occur at the end of each year, as is the case for the Tokau Reef area at Ovalau Island, there appear to be rare departures from this rhythm. One such is reported by Mr Sorenson for Wakaya Island, about ten miles away from Ovalau Island, where four risings occurred in quick succession in 1953 and 1954, the last occurring in January after the third quarter of the moon.

Forests and Climates in New Zealand

As a result of an extensive survey of the forests and climates in the South Island of New Zealand by J T Holloway (*Trans. Roy Soc. New Zealand,* **82**, 2, 329–410 , 1954), some interesting and important conclusions have been reached An analysis of the indigenous forests has revealed many striking peculiarities of forest species and forest type distribution and behaviour in the Western Southland. These peculiarities are shown to be explicable in terms of a hypothesis which states, briefly, that the forests as a whole are in an unstable condition consequent on comparatively recent changes in regional climates , and that, as a result, an active redistribution of species is in progress with the resultant development of a wide range of new, though unstable, forest types This hypothesis appears to have a general application in the South Island. It is shown that the phenomena discussed in this contribution are by no means peculiar to New Zealand forests, but that valid reasons can be advanced for the prominence of certain features in New Zealand forests in comparison with those of other countries The report is illustrated by some good aerial photographs.

Further Education

The role of a regional council for further education in the British system of education is explained in the introduction to the seventh annual report of the Southern Regional Council for Further Education (pp 30 , Reading, October 1954) Apart from the necessary background work to provide information, the Council serves as a forum for deliberation and agreement by representatives of constituent authorities, universities, technical colleges, government departments, representatives from industry and other interested persons The Council advises constituent education authorities. It secures general advice from among its own members, and special advice from the Academic Board and Advisory Committees Among various items referred to in the report is a paper on full-time release for the technical training of operatives in the heating and ventilating trade, and the continuation of teacher-training courses for part-time and full-time teachers at technical institutions

"A New Development in Aids for Sub-normal Vision"

Referring to the communication under this title by J Lederer in *Nature* of November 20, 1954, p 977, A. G. Bennett, 25 Brook Avenue, Wembley, Middlesex, has pointed out that there are two errors in the algebraic calculations H H. Emsley, 36 Meadow Way, Letchworth, has suggested that Mr. Lederer's third-order or Seidel equations are not sufficiently accurate, and that relaxation of accommodation and the assumption of the rotating eye are not justified. Mr. Lederer agrees that there were two algebraic errors in his calculations, revised equations and a new graph show, he claims, that there is no important change in the significant region As regards the use of third-order equations, Mr. Lederer states that their accuracy is sufficient, as evidenced by the field properties of lenses made according to them He adds that clinical study and experience of more than seven hundred cases of sub-normal vision have convinced him that there is no significant accommodative activity in the great majority of such patients, and that they engage in eye movements as well as head movements and movement of the printed matter Many have obtained much better results with such single-lens microscopic lenses giving a large, well-corrected field of view than with compound magnifiers of equal or even higher magnification with a small corrected field

Nairobi Scientific and Philosophical Society : Officers for 1955

The eighth annual general meeting of the Nairobi Scientific and Philosophical Society was held in the Town Hall, Nairobi, on January 28, 1955, at which the following officers were elected for the forthcoming year *President,* Mr D A. Davies , *Vice-Presidents,* Dr H. C Pereira, Mr. H. W. Gill and Dr H. H Storey , *Joint Honorary Secretaries,* Mr J. P Henderson and Mr J Glover (P O Box 931, Nairobi) , *Honorary Treasurer,* Mr. R W Walmsley , *Honorary Librarian,* Dr. D. W Duthie , *Committee Members,* Mr R W Rayner, Mr. H B Stent, Mr C J. Martin, Mr H E Watson and Dr. C C Webster

Conference on Cloud-Chamber Techniques

A conference on "Recent Developments in Cloud-Chamber and Associated Techniques" will be held in the Department of Physics, University College, London, during March 24–26 There will be sessions devoted to the diffusion cloud chamber, the multi-plate cloud chamber, the high-pressure cloud chamber, the bubble chamber, the interpretation of cloud chamber photographs, counter control systems for cloud chambers, and to overcompression and fast recompression techniques The conference will be held under the joint auspices of the Physical Society and University College, London, and members of the Physical Society are invited to attend Further information can be obtained from the Secretary, Department of Physics, University College, Gower Street, London, W.C.1.

Society for General Microbiology: Annual Meeting

The twentieth general meeting of the Society will be held in the Royal Institution, Albemarle Street, London, W.1, during April 18–20. The sessions on April 18 will be occupied by the presentation of original papers, and in the evening the second Marjory Stephenson Memorial Lecture will be given by Prof C. B. Van Niel, of the Hopkins Marine Biological Station, Pacific Grove, California, on "Natural Selection in the Microbial World" On April 19 and 20 there will be a symposium on "Mechanisms of Microbial Pathogenicity". The principal contributions have been collected and will be published as a book which will be made available before the meeting (members of the Society, 15*s.*, others, 25*s*). At the meeting the published papers will be taken as read and the two days devoted mainly to discussions following short summaries or commentaries on the published material by the authors concerned. Applications for the book must reach the General Office of the Society, c/o Institute of Biology, Tavistock House, Tavistock Square South, London, W.C 1, by March 15.

University of Sheffield

The Department of Fuel Technology of the University of Sheffield, which has been traditionally connected with the properties and combustion of coal and coke, has for some time extended the training of its undergraduates to equip them for careers in chemical engineering as well as fuel. It has become increasingly difficult to separate fuel technology from chemical engineering, and there is a very great demand from all types of industry for chemical engineers In recognition of this trend, the Department has changed its name to the Department of Fuel Technology and Chemical Engineering and will train students for careers in the fuel-supplying and fuel-using industries, such as the steel industry, plant designing, and oil-chemical and coal-chemical, heavy and light chemical industries.

The following appointments have been made in the University Mr. R. W Douglas, at present a member of the Research Laboratories of the General Electric Co , Ltd , to the chair of glass technology in succession to Prof H. Moore, who is retiring , Dr. G. K. T Conn, senior lecturer, to be reader in physics , Dr Gilbert Forbes, senior lecturer, to be reader in forensic medicine , D Hardwick, to the C H Desch research fellowship in metallurgy , and Dr. N. M Waldron, to the research fellowship in chemistry offered by the Birmingham Chemical Co., Ltd.

Announcements

Her Majesty Queen Elizabeth the Queen Mother has been elected Chancellor of the University of London in succession to the Right Hon the Earl of Athlone

The Physical Society has made the following awards for 1955 *Charles Chree Medal and Prize,* Dr. D. F Martyn, chief scientific officer of the Radio Research Board, Commonwealth Scientific and Industrial Research Organization, Australia , *Duddell Medal,* Dr R Kompfner, of the Bell Telephone Laboratories, Inc. , *Charles Vernon Boys Prize,* Dr. J W Mitchell, reader in experimental physics in the University of Bristol

Dr. J. H. Watson has been appointed chemist and assayer of the Royal Mint in succession to Mr. W. A. C. Newman, who has retired.

Dr Rhodes W Fairbridge, lecturer in geology in the University of Western Australia, has been appointed professor of geology in Columbia University, in succession to Prof. A K. Lobeck, who has retired.

Three Ramsay Memorial Fellowships, normally tenable for two years and worth £450 a year plus a grant for expenses of research not exceeding £100 a year, are being offered for chemical research. One of the Fellowships will be limited to candidates educated in Glasgow. Further information can be obtained from the Joint Honorary Secretaries, Ramsay Memorial Fellowships Trust, University College, Gower Street, London, W.C.1, to whom application forms must be sent not later than April 21

Two scholarships, tenable at research institutions in France during the academic year 1955–56, are being offered to British workers in medical science, excluding clinical medicine, by the Medical Research Council on behalf of the Centre National de la Recherche Scientifique. They are intended for young British graduates in medicine or science who have already had some experience in a branch of medical science, and are worth 50,000–70,000 francs a month, with a supplementary allowance, payable in sterling, for married men A working knowledge of French is essential. Application forms, to be returned by March 31, and further details can be obtained from the Secretary, Medical Research Council, 38 Old Queen Street, London, S.W.1.

The Royal Dutch-Shell Group of Oil Companies is offering two research studentships in geophysics, of value £450 a year (£500 for married men) and tenable for two to three years at the University of Cambridge, which are open to men of any nationality less than twenty-seven years of age on October 1 Further information can be obtained from Mr. B C. Browne, Department of Geodesy and Geophysics, Downing Place, Cambridge, to whom application forms must be sent not later than June 1.

A Symposium on Intermetallic Semi-conductors will be held at the Services Electronics Research Laboratory, Baldock, Herts, during April 26–27 Further information can be obtained from I M Ross at the Laboratory.

The seventh of the international symposia on crop protection that are held in Ghent each year will take place on April 26, and will coincide with the quinquennial Floralias of Ghent Those wishing to read a paper must submit it before March 10 Further information can be obtained from the president of the organizing committee, Prof J. van den Brande, State Agricultural College, Coupure Links 233, Ghent.

The sixth Students Biological Conference will be held in the Biology Departments of the University of Birmingham during March 27–April 1. Undergraduate and postgraduate students are invited to read papers (not necessarily the outcome of original research work) and reviews , to exhibit collections , and to present demonstrations of field and laboratory work and techniques, etc. The programme will include a conversazione and visits to places of biological and general interest Further information can be obtained from the Conference Secretary, Botany Department, University, Birmingham 15

CO-OPERATION IN ENGINEERING RESEARCH BETWEEN EDUCATIONAL INSTITUTIONS AND INDUSTRY

A GROUP of three papers on co-operation in engineering research between educational institutions and industry was presented for discussion at a meeting of the Education Group of the Institution of Mechanical Engineers on January 28 The first paper of the group was by Prof E Giffen, of Queen Mary College, London, comparing the magnitude of the co-operation in engineering research in Britain and in the United States Estimates of the amounts of money contributed by government departments and by industry to support research in engineering departments of universities and colleges (either in general or on specific projects) showed that the expenditure in the United States is more than a hundred times the figure for Britain Taking the facilities available for research in terms of staff and laboratory accommodation as proportional to the numbers of full-time students, it appears that, if British educational institutions were used to the same extent as those of the United States for co-operation in research with industry (including government departments), our expenditure on this work would be increased more than ten-fold

Prof. Giffen mentioned some of the reasons for this disparity in the amount of co-operation in the two countries and suggested that the real difficulties lie in ignorance, both in industry and in the universities, of the other side's point of view, and that many of these difficulties could be cleared away by full and frank discussion by those concerned He went on to consider the desirable upper limit to co-operation in research, taking as criterion the benefit to the teaching work of a university department, the limit is reached when the staff are doing as much research as is consistent with their continuing to take an active and effective part in teaching. Although there is evidence that the amount of co-operation in some universities in the United States has passed this limit, we in Britain have a very long way to go before we need have any fear of that.

The second paper in the group, by Mr. V. C. Davies, was concerned mainly with engineering research in technical colleges in co-operation with industry. He stressed the opportunities for part-time research students to investigate problems encountered in the course of their work in industry. The time that can be devoted to the work is often much greater than that spent in the college, and the rate of progress can be surprisingly fast. Mr. Davies is of the opinion that special staff are necessary to supervise research, perhaps on a part-time basis, and special care is needed in selecting suitable subjects for research from those suggested by students from industry. Many of these suggestions are concerned with development of a particular machine or component, while some are better left to industry, others can be investigated jointly, the firm providing its own staff for parts of the work and the college undertaking the more fundamental aspects.

Mr Davies pointed out the opportunities for more sponsored research, and its benefits to both colleges and industry The question of publication of results need not cause any difficulty The main reason why more systematic research is not conducted by the teachers in technical colleges is their heavy load of teaching Until recently, all such teachers were, and many are still, required to spend about twenty hours each week with students, this, with the additional time taken in the preparation of lectures and the reading of students' work, left little time for research by the conscientious teacher Recent changes have enabled some of the larger technical colleges to reduce the amount of teaching required of the staff, and this should make a marked improvement in the opportunities for research

The third paper, by Mr J H. R Nixon, was written from the point of view of the small and medium-size organizations engaged in the manufacture of engineering equipment. The need for more research and development is becoming more widely recognized, and with it the desire for more co-operation with educational institutions. Sponsored or contract research is a suitable method for dealing with well-defined projects, with short-term or medium-term objectives, and where specific information is required which is beyond the company's resources In many cases it is found that the investigation of such special problems requires parallel research on fundamental lines, leading to results of general interest and with wide applications.

Mr. Nixon's experience has shown that the greatest benefit is derived if a member of the firm's staff participates in the work as it proceeds. The man might be seconded to work full-time in the university; apart from the results of the particular investigation, the experience is valuable and enhances his worth on his return to his firm But part-time participation can also be very successful, because then the man can apply the results of his research to improvements in design or production as the research proceeds. No better integration of research and development can be obtained than by organizing them to go on side by side, either by a team of workers or by a single man, depending on the nature of the project. In Mr. Nixon's opinion, firms are not sufficiently informed about the specialized facilities available to assist them with research and advice. Closer contact is desirable between industrial designers and development engineers and the staffs of universities and technical colleges One way of achieving this is through the use of professors as consultants on plans for research and development—a method much more extensively practised in the United States than in Britain

Dr. D. Clayton, who opened the discussion, emphasized the need for care in choosing suitable research problems as a basis for co-operation, and indeed in choosing all subjects for research students, to avoid wastage of man-power. Those concerned with new problems in industry should separate them into different categories according to the extent to which they involve fundamental work or practical techniques and then decide which could be investigated inside the organization, the others, mainly those involving fundamental studies, should be handed over to suitable university departments, establishments of the Department of Scientific and Industrial Research or industrial research associations.

Other speakers gave examples of the way in which co-operation in research has increased in recent years and of the benefits both to industry and to the university staff. Special mention was made of the close contact between the Ministry of Supply and university departments of aeronautical engineering and also of the Ministry's scheme for employing university teachers as vacation consultants. Suggestions were made for better methods of communicating information about the results of research, and about research in progress. Higher-degree theses are quite unsuitable for general publication, and the results should be re-written at different levels to suit the different kinds of readers to whom the results would be useful. It was suggested that abstracts of all higher-degree theses should be deposited with a central organization, such as the Department of Scientific and Industrial Research, which would bring the work to the notice of interested people.

Postgraduate courses for men in industry provide an effective research contact between industry and universities. The courses might be of long or short duration, but should include some experience in the investigation of problems relevant to the industry. On the other hand, it was pointed out that many of the students attending such courses, and indeed a large proportion of the students engaged on research for higher degrees, come from overseas countries, with the financial support of their governments, and will bring no direct benefit to industry in Britain. If industry were really convinced of the benefits of research and postgraduate courses as a training for its young engineers, it should send more of them back to the universities, either full-time or part-time; this in itself would be a valuable method of maintaining closer contact and promoting co-operation between industry and educational institutions.

AIRFLOW OVER MOUNTAINS

A DISCUSSION meeting was held on the subject of the "Airflow over Mountains" in the rooms of the Royal Meteorological Society on January 19. The subject poses an interesting problem in hydrodynamics, and also has implications of considerable importance to aviation; accordingly, many visitors having an interest in the aviation aspects attended. The discussion was opened by Mr. G. A. Corby, of the Meteorological Office, who gave a summary of the state of knowledge of the subject.

Stationary lenticular clouds can often be seen both over and to the lee of hills and mountains, strongly suggesting that systems of waves can be initiated in an airstream by topography. Cirrus clouds at 20,000 ft. or more, too, are believed to be due sometimes to the topography below; while over the Norwegian mountains so-called 'mother of pearl' clouds can be seen on rare occasions at some 70,000–80,000 ft. Clearly, the influence of mountains on the airflow above can be much more than an intensification of turbulence. Glider pilots have contributed much useful observational evidence of these special airflow effects, and their experience leads to a certain conception of what an atmospheric lee wave system is like. By exploiting the up currents in such waves, gliders have exceeded 15,000 ft. over hills of moderate size in Britain, while they have penetrated well into the stratosphere in the powerful wave systems of the Sierra Nevada in California. Powered aircraft also are affected by these vertical currents, which occasionally may be sufficiently intense to constitute a hazard. Aircraft flying over or near mountains sometimes pass through alternate regions of lift and sink; these regions may not be accompanied by any significant turbulence and, indeed, remarkable smoothness is sometimes reported. Vertical currents of a few hundred feet per minute are, apparently, quite common, while on extreme occasions smooth vertical currents exceeding 2,000 ft./min. have been encountered by aircraft in Europe.

The hydrodynamical problem of the laminar, frictionless and isentropic flow over an idealized two-dimensional ridge has been studied by several workers, using perturbation theory. Prof. P. Queney confined himself to a uniform airstream, that is, one in which the static stability and wind in the undisturbed stream were constant, and found that the nature of the flow depended very much on the scale of the problem. For a very small hill, neither stability nor geostrophic forces were relevant, and his solution gave a single smooth disturbance over the hill. For a hill of a few kilometres in width, the stability became important, and a more complicated disturbance affected the flow above the hill throughout the depth of the airstream. For a large mountain ridge of about 100 km. in width, his solutions predicted a lee wave system. On examination, this wave system proves to be mainly a horizontal oscillation about the geostrophic wind, having a long wave-length of some hundreds of kilometres. Although such waves probably occur in the atmosphere, they cannot be responsible for the vertical currents which embarrass aircraft and are exploited by gliders.

In Dr. R. S. Scorer's theoretical work, provision was made for variations of static stability and wind in the vertical. A certain function of the wind and stability proved to be a parameter of fundamental importance in the problem, and Scorer has shown that for realistic lee waves to be possible in an airstream, a decrease in this parameter with height is necessary. The condition can be fulfilled in practice by the presence of a layer of marked stability (or an inversion) at middle levels, with less stable air above, or by a substantial increase in wind with height, or by some combination of these two effects. Perturbation theory calculations for the flow of such an airstream over a mountain predict a system of lee waves which accords well with observational data. The waves have a wave-length of a few kilometres, and after attaining a maximum amplitude at some level, they die away at greater heights, sometimes slowly, sometimes quickly. An example of the theoretical streamlines calculated for a particular case is given in Fig. 1; the relevant temperature and wind profiles are indicated at the left of the diagram. Examination of the characteristics of the airstreams in which mountain waves have been encountered by aircraft shows that the conditions are consistent with those deduced theoretically by Scorer. The theory could be exploited qualitatively for the preparation of advice to aviation interests; but it would be difficult to apply the theory with any precision because of the complications of the atmosphere and of mountainous terrain in general.

Dr. J. Forchtgott, an expert Czech mountain glider pilot, has carried out a series of field investigations over several mountain ridges of Central Europe, using teams of gliders, light aircraft and special ground observations. He found that no organized pattern of airflow could be discerned unless the airstream had stable or neutral stability, and the wind direction was fairly constant with height and

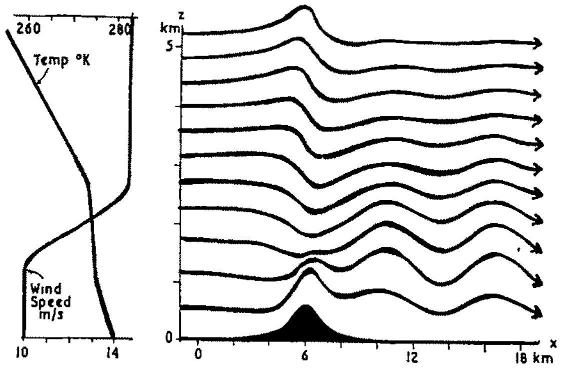

Fig 1 Theoretical stream-lines for the flow over a mountain ridge under conditions favourable for lee waves

roughly perpendicular to the mountain ridge. Subject to these conditions, the type of flow depended on the wind For moderate winds, a large semi-permanent standing eddy was often observed in the lee, with reversed flow up the lee slope. With stronger winds increasing with height, a lee wave system developed, often with lenticular (wave) clouds aloft and rotating clouds in the wave crests at heights comparable with that of the mountain top With very strong winds extending through a restricted vertical depth, that is, when, above the friction layer, there was reversed wind shear in the vertical, Forchtgott found that heavy turbulence occurred, due, he believed, to the formation of a system of vortices rotating in opposite directions and having features similar to the Kármán vortex street of hydrodynamics He named the latter flow type 'rotor streaming' Theory can as yet make no predictions as to the nature of such non-laminar flow patterns.

Mr. A. Yates described more recent work by Dr Forchtgott in which he has elaborated his diagnosis of the flow types From observations of lenticular clouds he has concluded that mountain waves sometimes move slowly downstream, to be followed sometimes by apparent rapid movements upstream. During the course of the meeting it was suggested that complicated interference must occur between the wave trains from separate orographic features, and this, coupled with random or systematic changes in the airstream characteristics, might well account for apparently erratic changes in the wave-length and amplitude of atmospheric wave systems

Mr C E Wallington gave an account of a calculation of the flow over a section of the Derbyshire countryside on an occasion when a marked wave system was encountered during a glider flight A close approximation to the topography was achieved using five Fourier integrals, and the profiles of static stability and wind were obtained from meteorological upper air data Synthesis of the five flow patterns obtained by perturbation theory gave the theoretical flow over the actual topography A useful measure of agreement between the observed and calculated flows was demonstrated

Prof G. Manley described some observations of the striking wave phenomena which sometimes occur with strong easterly winds over the Crossfell escarpment in Cumberland The question of separation of the flow and the formation of eddies was discussed by Dr R. S Scorer, who demonstrated the part played by viscosity in encouraging eddy formation Katabatic winds and such effects would discourage eddies , but on the whole it appeared, that the shape and steepness of the lee slope were the most important factors in determining separation Such effects near the surface could have a profound effect on the flow at much greater heights, because the effective shape of a hill becomes completely changed by the presence of a lee eddy

Research into the possibility of exploiting wind-power for the generation of electricity has stimulated the collection of wind data from hill tops in Britain Mr H H Rosenbrock reported that an increase of up to 40 or 50 per cent in wind speed is to be expected over hill crests, and as the power available from wind varies as the cube of the speed, the increase is important. In the case of a long ridge, the increase in speed arises from the compression of the stream-lines over the crest , but a similar increase is also attained over an isolated hill because much of the flow at low levels passes around the hill, and accordingly the crest-level flow is derived from a higher level

Mr K W. V Townsend discussed the distribution of tree damage from gales in hilly country Although this is complicated because of the variation of tree growth with altitude and soil properties, nevertheless the distribution was clearly dominated by the local distortion and intensification of the wind-flow by the terrain

The closely related subject of orographic rainfall was discussed by Mr J S. Sawyer, who pointed out that rainfall totals over 12 or 24 hr. were on much too coarse a time-scale to reveal the effects on rainfall of complicated and changing atmospheric waves However, it was clear that the increase in rainfall over hilly terrain was often significant to the lee as well as over the crests and windward slopes He had noted also that the increase was commonly much more marked to the south of depression tracks than to the north , an explanation could be that the wind structure to the south (normally an increase with height) would be more favourable for orographic disturbances to the airstream than to the north (where there would normally be reverse wind shear).

Mr H. S Turner put forward the suggestion that there might be an association on some occasions between high-altitude clear air turbulence, sometimes encountered by high-flying aircraft, and topography. The idea is gaining favour, and Dr Scorer has pointed out that mountain waves could provide the mechanism for the generation and maintenance of the large shears of wind which appears to be necessary for such turbulence

Some pilots of British European Airways described their experiences in flying through mountain waves and turbulence, and Mr R K. Pilsbury, of the meteorological office, Northolt Airport, gave brief details of an analysis of such aircraft observations.

G A. Corby

THE BRITISH COUNCIL

ANNUAL REPORT

APART from the chapter dealing with the welfare of overseas students, the portions in the report on the work of the British Council for the year ended March 31, 1954*, of most direct interest to the scientist are those discussing university interchange and the written and recorded word.

---

* Report on the work of the British Council for the year ending 31st March 1954 Pp v+105 (London British Council, 1954) 2s 6d.

The value of the work of the Council on university interchange was acknowledged at the Seventh Congress of the Universities of the Commonwealth in July 1953, and for the development of such services the Council depends largely on the co-operation of the universities and on the advice of its Universities Advisory Committee. Details of the interchange service with thirteen European countries, whereby during each academic session the British universities invited fifty-four distinguished scholars to Britain and in return a similar number of invitations were extended to British university teachers for the period 1948–53, have already been given

The Anglo-Belgian Mixed Commission has recently suggested that some of the younger university scientists who are doing original work of particular interest might profit from the opportunity of consultations overseas with research workers in their own fields of study Such interchange visits have already been arranged between the United Kingdom and Belgium, and it is hoped to extend the scheme to younger university scientists in other countries. More than a hundred scholarships tenable in the United Kingdom are now offered annually by the British Council to students from other countries, and a like number are offered to British students for study in fifteen European countries Among the short visits for consultation and lectures under the Commonwealth scheme for which awards were made during the year are those of Prof. P. A Giguère, of Laval University, to the United Kingdom, of Dr. F. C. Phillips, of the University of Bristol, to Australia, and of Sir Arthur Carr-Saunders to South Africa Thirty-six awards were made for study in the United Kingdom and twelve for study in other Commonwealth countries Under the foreign visits scheme, 31 awards were made for short visits from twelve countries to United Kingdom universities, and 43 awards for visits to universities in ten foreign countries

It is an essential part of the Council's work to use books and periodicals as extensively as its funds permit Export figures of English periodicals are unknown, but the annual export trade in books exceeds £14 million and nearly half the books published in Britain go overseas But there are important countries which can find no sterling for the purchase of British publications, and others have few or no competent booksellers, in some areas the British trade has not yet established itself The British Council libraries may thus be the only sources from which would-be readers of English can meet their needs. The Council's work is concerned first with publicity chiefly for new British work of all kinds, including book exhibitions, the forwarding of books for review, and the issue of the *British Medical Bulletin*, *British Book News* and the *British Agricultural Bulletin* Each issue of the first of these deals with a single aspect of medical science, the subjects covered in 1953–54 being enzyme research, viruses in medicine, reactions to injury and tuberculosis A second department deals with the supply of printed matter to libraries, schools and other institutions, and also with requests for bibliographical information. During the year, the small increase in the grant for books had surprisingly effective results, but annual replacements of about five per cent of stocks are still below the fifteen per cent required Thirdly, the Council's work in this field includes the production of publications such as the supplements to *British Book News* on "Writers and their Work", "English Language Teaching" and "Britain To-day", which has been discontinued since the report was prepared

Although the Drogheda Committee presented its report on overseas information services in July 1953, the summary of the report was not published until April 1954, nor has the Government even yet made known its intentions. That report emphasized that what the British Council requires more than anything else is a five-year programme of developments, with some guarantee that the necessary funds would be provided for its execution. In particular, directing attention to the great opportunities which await the Council in Asia and Africa, the report recommended an eventual increase of about £630,000 a year in the Council's vote

In the uncertainty as to whether the Government is prepared to accept any of the recommendations of this report, the Council has already been forced to make economies in its work in Europe, but it has been allowed to retain the proceeds and to re-invest them in work elsewhere, while some additional money has been granted to meet the Council's rising operating costs. On the question of this contraction of its work in Europe, however, the Council has some misgivings It gives reasons for believing that in detail the Drogheda Committee over-estimated the extent of the savings to be achieved by further curtailing that work (which has already been cut by fifty per cent over the past five years) More important, it questions the attitude to Europe disclosed in the report and is doubtful whether it is wise to rely solely on casual contacts in the face of a manifest anxiety for increased British cultural activity and co-operation in Europe

While recognizing the greatness of its opportunities and responsibilities in Europe, the Council remarks "It would be an exaggeration but not an untruth to say that a much closer understanding of the Englishman and his ways exists at Karachi than at Lyons, partly because Englishmen are a more familiar sight in one city than in the other, and partly because an outward similarity of culture helps to mask a basic difference of mental approach". The Council believes that the Drogheda Committee has misconstrued the importance of the work in Europe, because it has failed to appreciate that the Council's work has an element of disinterestedness as well as a representative aspect The Council exists as a body which helps to interpret overseas the permanent features of the British way of national life and to make available to the rest of the world the British contribution to knowledge, welfare or enjoyment If, however, the Council is always to aim at producing a definable political or commercial benefit for the country, it will lose the advantage it possesses over a government information department

It is a sound point that the British Council must sometimes do something for its clients simply because it is what the client wants, unless the idea is to grow that there is always a material motive behind its activities The point should not be pressed too far, but it is political wisdom that an independent body should not neglect its opportunities of disinterested service. In Europe, in Africa and in Asia alike, such a policy may yield rich returns in international goodwill and understanding.

Apart from these comments, the Council welcomes the Drogheda report, while expressing the reasonable hope that the stage of repeated major investigations (of which the Drogheda inquiry was the third in seven years) has been passed The Drogheda report has established beyond question the national importance of the Council's work and the efficiency with which it is carried out. It has also established the importance of continuity of planning and finance, and of stable and secure conditions of service To implement the recommendations to that end would be comparatively inexpensive and is imperative, irrespective of whether or not the Government is prepared to provide the additional resources which would enable the Council to seize the opportunities in Asia and Africa, the reality of which is amply confirmed in the present report

Since the report was published, the Government has stated in the House of Commons that it proposes to provide an additional £100,000 in the present and next financial years for the expansion of the overseas information services In particular, it is proposed to strengthen the information services in South-East Asia, the Middle East, Latin America and Canada, to improve the Central Office of Information Press Service and the supply of films for use overseas, to strengthen the Council offices in South-East Asia and Japan, establish new offices in Kuwait in the Persian Gulf and in British Honduras and re-open an office in Persia Full participation by the Government in the growing cultural activities of the Brussels Treaty Organization and of the Council of Europe is also proposed

PHYSIOLOGY OF STOMATA

THE seemingly evergreen topic of the physiology of stomata has evoked a number of further contributions by contemporary investigators M Shaw and G. A Maclachlan (*Canad J. Bot*, **32**, 6, 784, 1954) have studied the carbon dioxide fixation in stomatal guard cells By exposing the epidermis of species of *Tulipa*, *Hordeum*, *Tradescantia* and *Allium*, in which only the stomatal guard cells possess chlorophyll, to radioactive carbon dioxide, followed by microautoradiography, they have demonstrated the selective uptake of carbon dioxide by the guard cells in the light A less intense uptake was observed in the dark with *Allium*, *Sedum*, *Tulipa* and *Vicia* The rate of guard-cell synthesis, which was estimated for *Tulipa gesneriana*, appeared to be too low to account for the increase in osmotic potential caused by illumination. These investigators note that since the opening of stomata is promoted by low carbon dioxide tension, even in darkness, the removal of free carbon dioxide, or an effective lowering of its tension, by guard-cell activity, is probably more important in stomatal opening than the direct photosynthesis of osmotically active solutes in the guard cells

In a new theory of the mechanism of stomatal movement, W T Williams (*J. Exp Bot*, **5**, 15, 343; 1954) advances the ideas that the important movement is that of closure, that this is a positive or active process, and that the carbohydrate changes so frequently reported are secondary, 'stabilizing' changes, probably not directly linked to the main process The evidence for this conception of stomatal activity is discussed and some of its implications considered It is accepted that stomatal movements are primarily the result of turgor changes In expounding the theory the author directs attention to the many remarkable parallels between the movements of sensitive plants and of stomata. Reference is made to Weintraub's explanation of pulvinar movement in *Mimosa*, in which it is held that the rapid expulsion of water from the cells of the pulvinus is effected by way of contractile vacuoles, and to the movement of water in protozoa and unicellular algæ. In these micro-organisms this water movement is energy-assisted—a process which allows for the movement of water as distinct from solution, independent of osmotic gradients To quote the author on the subject of stomata: "If dark induced loss of turgor is an energy-assisted process, how, during the ensuing hours of darkness, is it maintained? Must water be continuously pumped out to maintain the flaccid condition? It would appear so for the theory postulates that the turgid condition is osmotically the position of rest, to which the cell must return if contractile forces are withdrawn—as occurs in light, or even, in response to an autonomic stimulus, in the unchanging darkness".

E. W. Yemm and A. J. Willis (*New Phyt.*, **53**, 3, 373, 1954) have made a study of the diurnal movements of the stomata of *Chrysanthemum maximum* by means of porometer measurements of leaf resistance and by examination of epidermal strips The amounts of sugar and starch in the epidermis and mesophyll were estimated. A highly significant correlation was demonstrated between the starch content of the guard cells and pore-width or leaf resistance. The opening of stomata in the morning was associated with a decrease in starch and an increase of sugars in the epidermis together with a fall in the water content of the leaf. The stomata closed when the water deficit exceeded 5 per cent of the water content of the fully turgid leaf The closure was associated with an increase of starch in the guard cells, but there was no corresponding fall in the sugars of the epidermis The total carbohydrates of the epidermis showed a distinct diurnal fluctuation which was in some respects like that of the mesophyll. In the light of this investigation the authors suggest that the diurnal movements of these stomata under natural conditions are mainly determined by the water relations of the leaf tissues and carbohydrate changes in the guard cells.

AN EXPERIMENT ON THE INHIBITION OF THERMAL CONVECTION BY A MAGNETIC FIELD

By Dr YOSHINARI NAKAGAWA

Hydrodynamics Laboratory, Department of Meteorology,
University of Chicago, Chicago

THE character of the thermal instability of a layer of incompressible liquid heated from below has been the subject of both experimental and theoretical investigation since Benárd's[1] discovery of cellular convection in those circumstances. The principal results established by these investigations are: (1) that a layer of fluid heated below first becomes unstable when the Rayleigh[2] number, $R = \frac{g\alpha\beta}{\kappa\nu} d^4$ (where g denotes the acceleration due to gravity, d the depth of the layer, β is the adverse temperature gradient which is maintained and α, κ and ν are the coefficients of volume expansion, thermometric con-

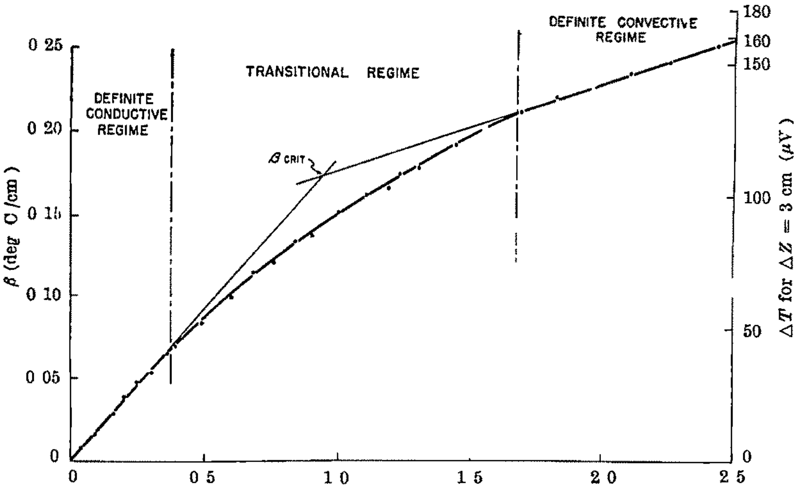

Fig 1 Temperature gradient at various rates of heating Experimental points are for temperature gradient measured at 1 cm and 4 cm levels in 5 cm depth of mercury Average magnetic field around central plane, 1,500 gauss

$$R_c = \frac{\alpha\beta_c g}{\kappa\nu} d^4 = 3·82 \times 10^5, \quad Q = \frac{\mu^2\sigma|H|^2}{\rho\nu} d^2 = 3·37 \times 10^4$$

ductivity and kinematic viscosity, respectively), exceeds a certain determinate value of the order of 1,000, and (2) that the motions which ensue have a cellular pattern in agreement with Benárd's observations The exact value of the Rayleigh number at which instability first sets in depends on boundary conditions, such as whether the plane surfaces between which the layer of fluid is confined are free or rigid (cf Jeffreys[3] and Pellew and Southwell[4]), and the values which have been derived theoretically have been confirmed by several experimenters[5,6]

Chandrasekhar[7] has recently re-examined this problem for the case of a layer of electrically conducting liquid heated from below and when an external magnetic field is impressed on the liquid. The principal result of his study was to establish that the presence of the magnetic field delays the onset of convection, and that the critical Rayleigh number at which instability sets in depends on the strength of the magnetic field (H) and the electrical conductivity (σ) of the fluid through the non-dimensional parameter $Q = \frac{\mu^2 H^2 \sigma}{\rho\nu} d^2 \cos^2\vartheta$, where μ denotes the magnetic permeability of the liquid and ϑ the inclination of the direction of H to the vertical. In his paper, Chandrasekhar has derived the $R(Q)$-relation for different boundary conditions (for example, both bounding surfaces rigid, both bounding surfaces free and one bounding surface rigid and the other free)

The experiments to be described below were designed to investigate the critical values of the Rayleigh number predicted by Chandrasekhar for different values of Q with mercury as the electrically conducting liquid The external magnetic field was provided by a permanent magnet used originally as the deflexion magnet for cosmic ray experiments and very kindly made available for this experiment by Prof Marcel Schein, of the Physics Department, University of Chicago

Mercury contained in a 'Pyrex' glass cylinder of 14·5 cm diameter was placed at the centre between the pole surfaces, the magnet being placed so that the field was vertical The average intensity of the magnetic field over the area of the glass cylinder at the central plane of the gap was about 1,500 gauss Uniform heating was applied by an electrical heater with d c current beneath a copper plate at the bottom of the cylinder A combination of sliding resistances was used to obtain various rates of heating, and to provide the relation between temperature gradient and the heating-rate as mentioned below

The quantities, except β, in the Rayleigh number and Q were given constants at each determination, and the criterion was investigated by means of the experimental determination of the critical adverse temperature gradient. The adverse temperature gradient was measured directly in this experiment by means of a five-couple copper–constantan thermopile immersed at two fixed levels in the mercury. The thermal e m f of the thermopile was amplified by a d c amplifier and recorded in an automatic recording milliammeter A continuous record of the temperature gradient was obtained within an accuracy of 0·01 deg C. for the total temperature difference between the two fixed levels

The temperature gradient was plotted against the heating-rate and the critical temperature gradient was determined from the intersection of the extrapolated linear trends of the pure conductive region and the pure convective region of heat transfer[8]. Fig 1 shows the experimental results for a 5-cm layer of mercury. The regions of heat transfer indicated

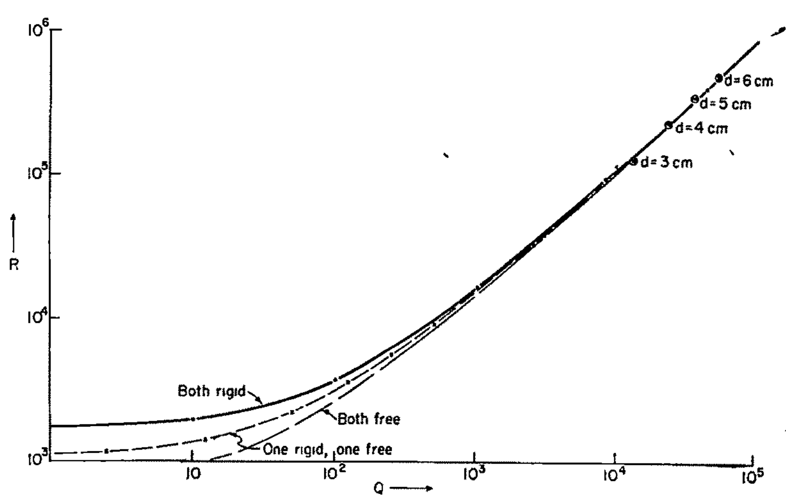

Fig 2 Dependence of the critical Rayleigh number on Q The curves are Chandrasekhar's theoretical curves, the experimental results are marked by circles, the depth of mercury used in each case being indicated

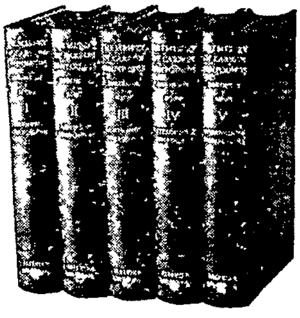
Chemistry of Carbon Compounds

Edited by E H RODD, D Sc, F R I C



Some of the 9 bound parts
Crimson cloth, 9 in. × 6½ in

THE masterly general survey which opens Part III (A) is by Prof C K. INGOLD (on views about structure, orientation and reactivity), Prof G H HEY and Dr G H WILLIAMS (on nucleophilic and homolytic substitution) and Dr N CAMPBELL (on the formation and fission of the benzene ring). Dr W J HICKINBOTTOM, DR Z E JOLLES, DR J CHATT, and Dr. E HOGGARTH cover most of the benzene derivatives, which will be completed in Vol III (B) along with pseudo-aromatic and multi-nuclear compounds

If pre-ordered
£5 5s.
After pub., £5 15s.

The 9 parts of this magnificent reference set will cost some £40, but 15% is saved on any ordered before publication Write to 31, Wright's Lane, London, W 8, for folder with specimen pages and authoritative reviews, or visit your scientific bookseller

McGRAW-HILL LONDON

Servomechanism Practice

WILLIAM R AHRENDT, *President of the Ahrendt Instrument Company Lecturer, University of Maryland*

This text provides in compact form a clear and logical treatment of the practical aspects of servomechanisms Whereas other books are primarily concerned with the theory of the subject, this work covers circuitry, electrical and mechanical components, and practical problems encountered in servo design and manufacture

9 × 6 inches 341 pages Illustrated 50s

Chemical Calculations 6th edition

HAROLD V ANDERSON, *Lehigh University*

This book is primarily designed to assist the chemistry student in understanding the mathematical applications of the many fundamental principles of elementary and general chemistry

The sixth edition contains numerous important changes and additions

9 × 6 inches 305 pages 34s

Higher Transcendental Functions

A ERDELYI, *California Institute of Technology*

"This work is a worthy tribute to the memory of an outstanding mathematician and its great importance as a major work of reference hardly needs emphasis"—*Engineering*

"No university or scientific library will be complete without having these volumes on its shelves."—*Nature*

Vol 2	9 × 6 inches	400 pages	56s 6d

New and forthcoming books

Embryogenesis in Plants

C W WARDLAW
Professor of Cryptogamic Botany, University of Manchester

In this book, the first botanical treatise of its kind, the author has examined the process of embryogenesis in all classes of plants, from Algae to Angiosperms The basic anatomical facts of embrvo development are described and profusely illustrated, and recent experimental work, relating to the actual processes involved, has been introduced wherever possible.

With 84 line illustrations. 42*s*

The Nitrogen Metabolism of Micro-Organisms

B A FRY
Lecturer in Microbiology, University of Sheffield

(Monographs on Biochemical Subjects)

This monograph provides a convenient introduction to one important section of microbial biochemistry The underlying theme is none other than that known to all biologists as the 'Nitrogen Cycle,' and an attempt has been made to analyse some of the component steps of the cycle from the standpoint of the biochemistry of the various reactions and the micro-organisms concerned

With 3 plates and 15 diagrams 9*s* 6*d*

Photosynthesis

ROBERT HILL, F R S, and
C P. WHITTINGHAM, Ph D

(Monographs on Biochemical Subjects)

A concise but comprehensive survey of current research in Photosynthesis, dealing first with the earlier classical work on the physiology of photosynthesis and then discussing the relevant basic biochemical aspects of the subject

With 20 diagrams 8*s* 6*d*

Mass Spectrometry

A J B ROBERTSON
Lecturer in Chemistry, University of London, King's College

(Monographs on Chemical Subjects)

"The book is well written, the treatment is interesting and authoritative, the diagrams are clear, and many references are given for further reading It will be of interest to a wide circle of readers, including students, teachers and research workers" *Chemical Age*

With 2 plates and 26 diagrams 8*s* 6*d*

MACMILLAN BOOKS

Comprehensive Inorganic Chemistry

Edited by M CANNON SNEED, J. LEWIS MAYNARD and ROBERT C BRASTED

Volume III—The Halogens, by ROBERT C BRASTED

Comprehensive Inorganic Chemistry is an eleven-volume reference work on the chemical elements and their inorganic compounds In this Third Volume the significant advances of recent years are fully reflected in a broad treatment of halogen chemistry Both basic principles and their applications are exhaustively covered, as well as the new processes, methods of production, and the chemistry of compounds which have lately become so important 35*s.*

General College Chemistry

Edited by M CANNON SNEED, J LEWIS MAYNARD and ROBERT C. BRASTED

Rapid developments in chemistry during the post-war period have made a thorough revision of the first edition necessary, especially in those areas dealing with atomic structure, nuclear reactions, and industrial chemistry The text has been shortened, and a more systematized treatment has been introduced *Second revised edition.* 48*s.* 6*d.*

Advanced Level Examples in Physics

R. V. JOHNS, M A., B.Sc.

Lecturer in Physics and Mathematics, City of Liverpool College of Technology

W. F WARE, B Sc , A.Inst P

Senior Physics Master, Cathays High School for Boys, Cardiff

This book of numerical examples is designed to supplement the theoretical and laboratory work of students preparing for examinations in Physics at the Advanced level of the General Certificate of Education and for Intermediate Degree examinations. Some 1,000 examples have been arranged by topics and carefully graded in difficulty. Contents are arranged under the headings Mechanics and Properties of Matter, Heat, Light, Sound, and Magnetism and Electricity 16*s.*

Functions of a Complex Variable

THOMAS M. MACROBERT, M.A , D.Sc.

Professor of Mathematics in the University of Glasgow

This book is designed for students who, having acquired a good working knowledge of the calculus desire to become acquainted with the theory of functions of a complex variable, and with the principal applications of that theory In order to avoid making the subject too difficult for beginners, the author has abstained from the use of strictly arithmetical methods *Fourth Edition.* 20*s.*

ANTWEILER Micro Electrophoresis Apparatus

WITH SCHLIEREN OPTICAL CONTROL ATTACHMENT

A compact instrument for the quantitative analysis of serum proteins combining maximum accuracy with speed and simplicity of operation

★ **Effective protein separation within 15 to 20 minutes.**

★ **Only 60 to 90 minutes required for a complete quantitative analysis giving consistently accurate and comparable data.**

★ **The progress of separation can be viewed continuously, and a distinct Schlieren Picture is formed after only a few minutes run**

The last feature makes the instrument particularly valuable for rapid routine clinical examinations

BTL Electrometric Apparatus for KARL FISCHER TITRATIONS

The apparatus is here seen in the laboratories of Messrs Parke, Davis & Co Ltd Besides applications in the pharmaceutical field it has been found of great value in the control of production of sugar, confectionery, industrial starch products, oils, solvents and many other materials

The BTL KARL FISCHER apparatus is self contained with a built-in end-point indicating circuit of high sensitivity, so that no external potentiometer is required Other features include —

- Two burettes, one for Karl Fischer Reagent and the other for methanol water solution for back titration
- Microammeter scale marked "Excess Water" and "Excess Fischer".
- Nozzles and connections to enable dry nitrogen to be passed over the contents of the reaction vessel
- Three types of reaction vessel are available (a) standard with no special filling facilities (b) with side tube for filling (c) with side tube for filling and base tube with stopcock for draining

TYPE 101A ADD-ON COUNTER

Developed for industrial and research use, the Add-on range of counting equipment comprises a number of different units which are fitted together as required to provide versatile yet inexpensive devices for the solution of a variety of counting problems

For normal counting purposes the Power Unit which incorporates the Input Decade is supplemented by as many decade "units" as the particular application requires Auxiliary units enable the equipment to be used for batch counting, or for process timing

The count is clearly displayed on ERICSSON long life cold cathode dekatron tubes

The units are rigidly assembled in line, with electrical connection between units maintained through 12 pin plugs and sockets

Available, either frame-mounted for standard rack (19″-48 3 cm) or with end plates for bench mounting

ABRIDGED SPECIFICATION

Max counting speed 3,500 per sec

Input Sensitivity 5V RMS (sine)
5V Peak (pulse)

Output pulse obtainable from each decade

Internally derived 100 pulses/second for timing

Manual or electronic control of start, stop and reset

Supplies available for input probe, etc

Finish, green panel, hammer-green case

Distillation Products Industries *is a division of* **Eastman Kodak Company**

For scientific electronics...

In its most advanced form, specialised production in electronics today calls for the combined skill, knowledge and experience of a diversity of scientists and technicians and may employ a similar diversity of resources at the stage of physical interpretation, if the sum of this intelligence is to result in the most efficient end product.

Plessey number all these facilities, and many others, as closely integrated parts of a single division — the Electronics Division — and are, in consequence, able to offer a rare if not unique service to manufacturers for the limited or quantity production of their products.

Among those renowned organisations which have current contracts with Plessey are included BTH, Decca, IAL, Kelvin Hughes, Marconi's Wireless Telegraph Company Ltd., and Laurence Scott & Electromotors Ltd.

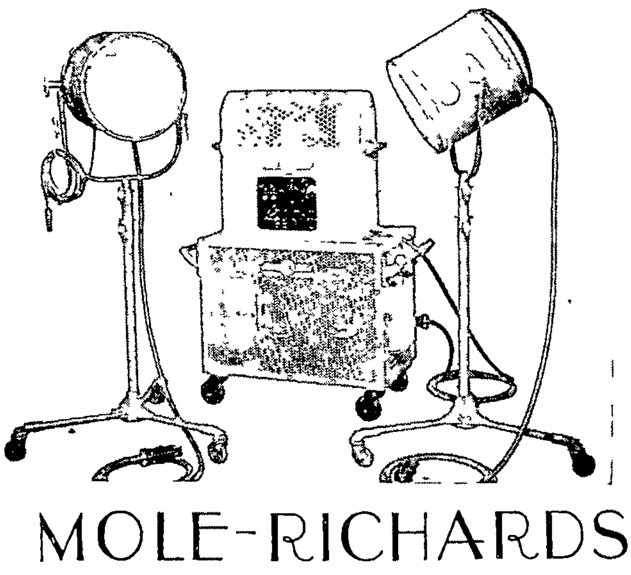
Lighting for High-speed Cinematography

For the illumination of small areas for brief periods at extremely high brightness levels, the CINE-FLASH provides accuracy of control and repeatability of results, and produces the minimum of heating



CINE MOLE-RICHARDSON (ENGLAND) LTD FLASH

SPECIFICATION

LIGHT SOURCE Mazda mercury-cadmium discharge lamp, continuously rated at 1 KW, with special electrodes permitting it to be flashed at very high power for short periods

LAMP FITTING Parabolic reflector, 13 in dia, with alternative diffusing glasses giving either a narrow or wide angle beam.

CONTROL UNIT Designed to operate one or two lamps, each at
3 KW for 5 seconds,
5 KW for 2 seconds, or
10 KW for 1 second

The circuit includes also high-voltage impulse ignition system, and provision for remote control

RECTIFIER For operation on A C, a 3-phase mercury rectifier is provided

ILLUMINATION DATA The following intensities are typical of the results attained by each lamp at the 10 KW loading (at other settings the illumination is proportional to the wattage)

	Distance (ft)	Illumination at centre of spot, foot-candles	Dia of spot to 70% of maximum intensity (in)
With normal diffusing glass	4	150,000	10
	10	30,800	15
	30	2,700	32
With wide divergence glass	4	16,500	33
	10	3,370	50
	30	300	106

in the figure were determined by inspection of the time-record of the temperature gradient

When heating is applied at the initial state of zero gradient, the adverse temperature gradient builds up gradually and follows characteristic trends in the conductive and convective regions of heat transfer respectively In the conductive region, the temperature gradient reaches a certain limiting value and remains at that value for continuous heating In the convective region, the temperature gradient reaches a peak value, then breaks into oscillation around a slightly lower value.

In both regions of heat transfer, empirical linear relations between the heating-rate and the temperature gradient were obtained by various experimenters[5,6,8]. Therefore, the transitional region was defined by the obvious deviation from the linear relationship, and the record of non-oscillatory breakdown

Since the intensity of the magnetic field varied considerably within the region occupied by the container from 1,250 gauss near the outer radius of cylinder to 1,750 gauss at the top and the bottom, this transitional region most probably is due to the earlier onset of convection in weaker parts of the field

The results of the experiment, in terms of the critical Rayleigh numbers, are shown in Table 1 for four different depths of the mercury layer, where the values of critical temperature gradient for the non-magnetic case were evaluated from the value of the critical Rayleigh number of 1,708 It may be noted that the boundary conditions that actually obtained are those for two rigid surfaces, because of the presence of a contaminant film on the top surface of the mercury

Table 1

Depth (cm)	For $\frac{Q}{H}$ = 1,500 gauss	Critical Rayleigh number obtained	Measured critical gradient temperature (deg C /cm)	Critical temperature gradient for non-magnetic case (deg C /cm)
3 0	$1\ 2\times10^4$	$1\ 38\times10^5$	0 478	$5\ 92\ \times10^{-3}$
4 0	$2\ 2\times10^4$	$2\ 49\times10^5$	0 273	$1\ 88\ \times10^{-3}$
5 0	$3\ 4\times10^4$	$3\ 82\times10^5$	0 171	$0\ 768\times10^{-3}$
6 0	$4\ 9\times10^4$	$5\ 42\times10^5$	0 117	$0\ 371\times10^{-3}$

These values of the critical Rayleigh number practically coincide with the theoretical values given by Chandrasekhar as seen in Fig 2, where the estimated average intensity of the magnetic field of 1,500 gauss is used for Q It is particularly striking that, in spite of the difficulties associated with the non-uniformity of the magnetic field, the theoretical slope is closely approximated by the four points in Fig. 2 Thus the experiment verifies the predicted inhibition effect on the onset of convection in an electrically conductive liquid under an external magnetic field

The details of this work will be published elsewhere. The encouragement and guidance given by Prof. S. Chandrasekhar and Dr D Fultz are acknowledged, thanks are also due to Prof M Schein and Dr C. M. York for the use of the magnet. The investigation has been made possible through support and sponsorship extended by the Geophysics Research Division, Air Force Cambridge Research Center, under a contract.

STRUCTURE OF THE ISOMERIC 2:4-DINITROPHENYLHYDRAZONES OF SOME ALPHA-KETO-ACIDS IN RELATION TO THEIR INFRA-RED SPECTRA

By Dr F. A ISHERWOOD

Low Temperature Station for Research in Biochemistry and Biophysics, University of Cambridge, and Department of Scientific and Industrial Research

AND

R LUMLEY JONES

Edward Davies Chemical Laboratories, University College of Wales, Aberystwyth

THE discovery that each α-keto-acid could give two 2 4-dinitrophenylhydrazones has already been described in connexion with the separation and analysis of mixtures of pyruvic, oxalacetic and α-keto-glutaric acids on paper chromatograms[1]. The two hydrazones obtained from each α-keto-acid were provisionally regarded as stereoisomers about the —C=N— linkage, though it was not possible definitely to identify the individual isomers as *cis* or *trans*. The R_F values did not bear any simple relationship to each other, such as might have been expected by analogy with the separation of diastereoisomeric sterols on alumina[2] In fact, they varied so widely with the α-keto-acid and the nature of the chromatographic system that the presence of steric factors other than *cis-trans* isomerism was suggested.

The present study was undertaken in order to provide confirmatory data for the structural assignment of the hydrazones as geometrical isomers and to elucidate the nature of the steric factors which affect the chromatographic properties of the isomers. For this purpose 20–30 mgm. of the isomeric hydrazones were separated on paper chromatograms, using paper which had been buffered to pH 8 0 (for conditions see ref 1) The separated hydrazones were extracted with 0 2 M sodium bicarbonate, and under these slightly alkaline conditions were quite stable. To prepare the free hydrazones, the sodium bicarbonate extract was acidified to pH 2 0 with dilute sulphuric acid and extracted with chloroform containing 10 per cent ether The chloroform extract was dried over anhydrous sodium sulphate and then

(*h*) Anthranilic acid
(*k*) N-2 4-Dinitrophenylanthranilic acid

evaporated to dryness *in vacuo* The hydrazones were prepared as rapidly as possible, and at no time were they subjected to temperatures above 15–20° Examination of their infra-red spectra was complete within twenty-four hours of preparation Even so, the isomeric hydrazones of oxalacetic acid had become inter-converted sufficiently for the spectra to be indistinguishable. In the case of pyruvic acid, the change was sufficiently slow not to interfere with the interpretation of the results (equilibrium was not reached even after three to four weeks at room temperature). The hydrazones of α-keto-glutaric acid were stable

The infra-red spectra were all obtained with the substances in the solid state and ground with a suitable quantity of liquid paraffin to form a mull. Where absorption of the paraffin was too strong for the detection of bands due to the compounds being studied, hexachlorbutadiene was used instead[3]. The instrument used was a single-beam infra-red spectrometer fitted with a rock-salt prism It was very carefully sealed, mainly by means of high-vacuum wax, until the flow of a litre or so of nitrogen through the apparatus from a cylinder of compressed gas was enough to reduce the water-vapour content to a few per cent of the original.

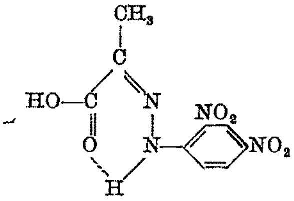
The infra-red spectra were naturally of some complexity. The details of each compound, anthranilic acid, N-2 4-dinitrophenylanthranilic acid, 2 . 4-dinitrophenylhydrazine and the 2 4-dinitrophenylhydrazones of acetaldehyde, pyruvic acid (1 and 2), α-keto-glutaric acid (1 and 2) and oxalacetic acid (mainly 2) are given semi-diagrammatically in Fig. 1. The height of the vertical lines, which represent absorption bands, is a measure of the intensity of the bands (per cent absorption). The only drawback to this method of presentation is that shoulders on the sides of main absorption bands appear as distinct peaks. However, where this has occurred and it has any bearing on the interpretation of the results, the fact has been indicated in the text

A brief inspection of the structure of the compounds, assuming them to be geometrical isomers, suggested that interaction might be possible between the carbonyl of the carboxylic acid group and the imino group attached to the aromatic ring Such interaction might well affect the absorption bands of both the carbonyl group and the imino group In the present study, attention was focused more particularly on the nature of the absorption arising from the stretching of the carbonyl link, because the bands attributable to this cause are characteristic and occur in a part of the spectrum which is free from interference due to the 2 4-dinitrophenylhydrazine residue (compare with the spectra of the free hydrazine and acetaldehyde hydrazone). An additional advantage is that the position of the carbonyl frequency is not appreciably modified by differences in crystalline form The positions of the absorption bands arising from the stretching of the imino link were obscured by uncertainties in the calibration of the instrument and the relatively poor resolution obtained with the rock-salt prism in this part of the spectrum The spectrum of each compound will be discussed in turn

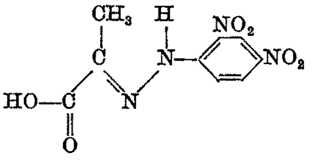
Pyruvic acid 2 *4-dinitrophenylhydrazone* (1), R_F 0 6 on paper buffered to *p*H 8 0 (cf ref. 1), melting point 208° (decomp), λ_{max} 380 mμ in 0 2 *M* sodium bicarbonate, gives very little red colour with 1–1 5 *N* sodium hydroxide (0 001 *M*)

The compound gives rise to two absorption bands, at 1,722 and 1,672 cm $^{-1}$ That both these bands are associated with the carbonyl linkage is borne out by the fact that they disappear in the spectrum of the sodium salt The presence of a subsidiary band at 1,672 cm.$^{-1}$ suggests that some form of chelation has taken place in a substantial proportion of the absorbing molecules Whereas normal saturated aliphatic acids absorb strongly in the region 1,725–1,700 cm.$^{-1}$ in the solid state, it has been shown by Flett[4] that, in a significant number of cases where chelation can occur between the carbonyl linkage and an amino or imino hydrogen, absorptions occur below 1,680 cm $^{-1}$.

In order to supply confirmatory evidence, the spectra of anthranilic acid and its N-2 4-dinitrophenyl derivative were obtained. These molecules give rise to single absorptions at 1,667 and 1,679 cm $^{-1}$ respectively, from which it may be deduced that chelation is complete This would be facilitated by the proximity of the carboxyl and amino (or imino) groups The actual positions of the bands may not be strictly comparable, due to the possibility of conjugation between the carbonyl linkage and the benzene ring Taking the structure normally assigned to the hydrazones of α-keto-acids, the most likely explanation of the occurrence of the band at 1,672 cm $^{-1}$ in the present isomer is that hydrogen bonding occurs between the hydrogen of the imino group



(I)



(II)

of the 2 · 4-dinitrophenylhydrazine residue and the carbonyl oxygen of the carboxyl group (see I).

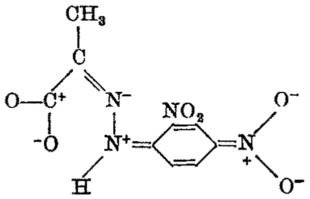
Pyruvic acid 2 4-dinitrophenylhydrazone (2), R_F 0·4, melting point 210° (decomp.), λ_{max} 370 mμ in 0·2 *M* sodium bicarbonate, gives a characteristic red colour with 1–1·5 *N* sodium hydroxide (0·001 *M*)

The spectrum in the carbonyl region is characterized by the appearance of a strong absorption band at 1,726 cm.$^{-1}$ together with a very weak absorption at 1,676 cm.$^{-1}$. It is highly probable that this absorption arises from contamination with a trace of the other isomer. The absence of a band of any appreciable intensity below 1,680 cm.$^{-1}$ precludes the possibility of any form of chelation in the molecule, and the value (1,726 cm.$^{-1}$) of the carbonyl frequency eliminates the possibility of ring formation with the resulting modification of the carbonyl group. The structure would be represented by (II)

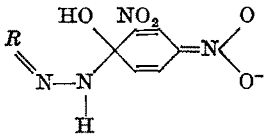
These structures (I and II) are consistent with the other properties of the compounds The melting point of (I) is slightly lower than (II), though this is scarcely significant because melting points accompanied by decomposition are not very characteristic and in addition there is a marked inter-conversion of such isomers at the melting point[5]. The sodium salts of (I) and (II) will have the same configuration, but without the hydrogen bond between the imino group and the carbonyl group The higher R_F value of the sodium salt of (I) on paper chromatograms is a reflexion of the steric interference of the neighbouring phenyl group on the ability of the ionized carboxyl to attract water molecules and become incorporated in the water–cellulose complex[6]. Such steric factors are not present in (II) The higher λ_{max} of (I) in the ultra-violet as compared with (II) is probably due to the stabilization of an excited state such as (III), as a result of electrostatic attraction (cf Ramirez and Kirby[5])

The deep red colour given by most 2 4-dinitrophenylhydrazones of ketones in alkali is probably due to the attack by an OH$^-$ to give a compound such as (IV) (or resonance form) In the case of (I) the approach of the OH$^-$ is hindered by the proximity of the ionized carboxyl group, and little or no red colour is formed. (II) gives the usual red colour.

α-Keto-glutaric acid 2 4-dinitrophenylhydrazone (1), R_F 0·28, melting point 145° (decomp), λ_{max} 387 mμ in 0·2 *M* sodium bicarbonate, gives a weak red colour with 1–1·5 *N* sodium hydroxide (0·001 *M*).



(III)



(IV)

The spectrum is characterized by the appearance of an intense absorption at 1,707 cm.$^{-1}$ which is flanked by a shoulder at 1,724 cm.$^{-1}$ and a subsidiary peak at 1,673 cm.$^{-1}$ The band at 1,707 cm.$^{-1}$ corresponds to the single band shown by the higher members of the aliphatic dicarboxylic acids series at about 1,700 cm.$^{-1}$. Oxalic and malonic acids give rise to two carbonyl absorptions, but they are anomalous. The other two absorptions, at 1,724 cm.$^{-1}$ and 1,673 cm.$^{-1}$, lie in exactly the same positions as the absorptions of isomer (I) of pyruvic acid. This would seem to indicate a similar type of structure to that postulated for the pyruvic isomer (I).

α-Keto-glutaric acid 2 4-dinitrophenylhydrazone (2), R_F 0·16, melting point 215° (decomp), λ_{max} 377 mμ in 0·2 *M* sodium bicarbonate, gives a moderately strong red colour with 1–1·5 *N* sodium hydroxide (0·001 *M*)

As in the case of the faster moving derivative, this compound gives rise to an intense band centred at 1,705 cm.$^{-1}$ The shoulder to this band at 1,717 cm.$^{-1}$ and a weaker peak at 1,682 cm.$^{-1}$ point to a lower degree of hydrogen bonding, since they are separated by 35 cm.$^{-1}$ instead of 51 cm.$^{-1}$ as in the faster moving compound. The hydrogen bond is possibly between the carbonyl of the carboxyl farthest away from the hydrazine residue and the imino hydrogen, thus suggesting that an 8-membered ring is present.

The other properties of these compounds agree with the conclusions drawn from the infra-red study As in the case of pyruvic acid, the *cis* isomer ((I) in the case of pyruvic acid) has the lower melting point, higher λ_{max} and gives a rather weaker red colour with alkali. The red colour of both isomers is weak compared with that of pyruvic acid (II), and this may be ascribed to the effect of the ionized carboxyls near the phenyl group shielding it from attack. The high R_F value of the *cis* isomer in solvents containing large amounts of ammonia may be ascribed to the fact that the free carboxyl in this case is very weak (pK_a about 6, the other has pK_a about 3), and the ammonium salt is largely undissociated and therefore more soluble in organic solvents

Oxalacetic acid 2 . 4-dinitrophenylhydrazones. These were too unstable as the free isomers for detailed examination λ_{max} of the faster moving isomer as compared with that of the slower (λ_{max} 385 and 370 mμ in 0·2 *M* sodium bicarbonate respectively) suggested by analogy with pyruvic acid that it had the *cis* configuration

We would like to thank Dr Mansel Davies for reading the manuscript and Dr T. Swain for the suggestion regarding the use of hexachlorbutadiene

The work described in this paper was carried out as part of the programme of the Food Investigation Organization of the Department of Scientific and Industrial Research. [Oct 27

Gas-Phase Chromatography

QUITE recently, papers have appeared describing in detail the process of gas-phase chromatography[1-3] Briefly, a sample of gas is injected into one end of a column packed, for example, with kieselguhr impregnated with a high-boiling organic compound such as dinonyl phthalate, and a current of nitrogen is fed into the column to elute the sample Owing to the fact that various compounds diffuse through the column at different rates, the components of the mixture emerge diluted with nitrogen and can be identified individually. Generally, some physical property of the issuing gas, such as thermal conductivity, is measured, and a continuous record of this property as a function of time is obtained Each component of the mixture shows up as a separate peak and, from the time taken for it to appear, identification can be made, the size of the peak provides a measure of the concentration Unfortunately, detectors depending on thermal conductivity vary widely in sensitivity for different gases, and the maximum sensitivity obtainable for many gases is not very high

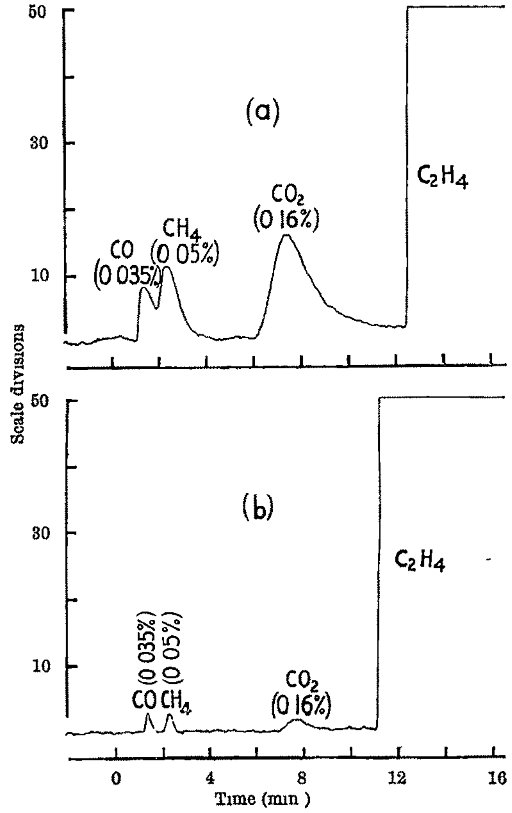

Fig 2 Chromatograms of cylinder ethylene 9 0 ml of sample. Nitrogen flow, 25 ml /min (*a*) Column temp, 20° C, at start, rising to 45° C after 3 5 min, 10-cm cell in gas analyser, sensitivity full scale for 0 06 per cent carbon dioxide (*b*) Column temp, 20° C, at start, rising to 45° C after 2 5 min, 1-cm cell in gas analyser, sensitivity full scale for 0 6 per cent carbon dioxide

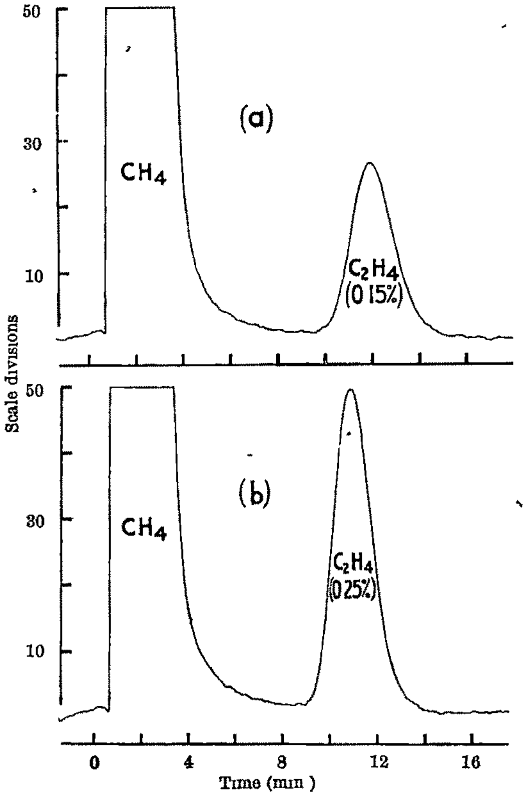

Fig 1 Chromatograms of 99 9 per cent methane 9·0 ml of sample Nitrogen flow, 30 ml /min Column temp, 57° C 10-cm cell in gas analyser, sensitivity full scale for 0 06 per cent carbon dioxide (*a*) Original sample (*b*) Sample with 0 103 per cent ethylene added

To extend the field of usefulness of gas chromatography, the need for a more uniform and more sensitive means of detecting each component as it emerges from the column has become apparent, and the infra-red gas analyser appears to meet these requirements in many cases For infra-red absorbing gases, it would suffice to use a detector in the instrument sensitive to all the compounds present in the sample, but still the sensitivity to various compounds would vary somewhat, and also adequate sensitivity might be difficult to obtain In the case of organic gases and vapours, these difficulties are readily overcome by passing each compound as it comes from the column through a tube containing copper oxide heated to dull redness, or other suitable oxidizing agents, to convert the carbon to carbon dioxide and any hydrogen to water vapour. These gases are then passed through an infra-red gas analyser provided with a detector sensitive to carbon dioxide, and as each component emerges from the column and passes into the instrument after oxidation, an indication on the output meter is obtained. This procedure (patent applied for) has the following important advantages

(1) Very high sensitivity is obtainable, since there is no difficulty in obtaining full scale for 0 01 per cent of carbon dioxide in nitrogen when using a 30-cm absorption cell.

(2) The gas from the hot copper oxide need not be specially cooled, since the rate of flow is so small that natural cooling is adequate

(3) Water formed in the combustion may condense or pass through the gas analyser as vapour. Gross amounts should be removed to avoid loss of carbon

dioxide, but the instrument is unresponsive to water vapour and careful drying is not required.

(4) Assuming that the gas analyser has been calibrated for carbon dioxide, the sensitivity to any other organic gas after combustion is simply proportional to the number of carbon atoms in the molecule.

To illustrate the power of the method, chromatograms of methane and ethylene were obtained using a column made by packing a 30-cm. length of glass tubing, 4 mm. bore, with activated charcoal[3]. The column was enclosed in a water jacket which could be heated electrically, and nitrogen was allowed to flow through the column continuously at the rate of 25–30 ml /min, a pressure head of 13 cm. mercury being required to maintain this flow. Approximately 10 ml of sample gas was injected from a gas burette, the flow of nitrogen being interrupted for a few seconds while this was done.

Fig 1 shows chromatograms of methane (said to be 99 9 per cent pure by the suppliers), with and without the addition of 0 103 per cent by volume of ethylene No impurity is disclosed in the methane except 0 15 per cent of ethylene. Fig 2(*a*) shows a chromatogram of ordinary cylinder ethylene, the presence of carbon monoxide, methane and carbon dioxide are clearly indicated Fig. 2(*b*) was obtained under similar conditions except that the path-length of the sample cell in the gas analyser was reduced from 10 cm. to 1 cm. This has the effect of reducing the sensitivity to a considerable extent, but discrimination is improved, and the carbon monoxide and methane peaks are clearly separated. Higher hydrocarbons are well displaced from the ethylene peak, but were not present to any appreciable extent in the two gases tested.

There is an optimum length of absorption cell in the infra-red gas analyser for each compound, depending on the time taken to remove it from the column. For maximum sensitivity, the volume of the sample cell should equal approximately the total volume of nitrogen required to sweep the gas in question from the column, a longer cell merely broadens the band without increasing its height.

Permanent Dissociation of Sulphur Hexafluoride in Corona Discharges

THE high dielectric strength of sulphur hexafluoride has been measured by various workers, and many reasons for its existence have been put forward Because of its good insulating properties, sulphur hexafluoride is now used extensively in Van de Graaff generators and in gas-filled cables. The following experiments were carried out to find what permanent changes in molecular pattern, if any, could be observed when a corona discharge was run in sulphur hexafluoride and the products examined with a mass spectrometer. Clearly the results would be of interest in practical cases where corona discharges are present

Table 1

Ion	Relative abundance	Ion	Relative abundance
SF_5^+	100	SF_2^+	3 4
SF_4^+	9 3	SF^+	3 3
SF_3^+	22 8	F^+	1 3

There appear to be no published mass spectrometer studies of the permanent products of dissociation in electrical discharges in complex-attaching gases Schumb, Trump and Priest[1] passed corona and spark discharges through sulphur hexafluoride, noted pressure changes, as previous workers had done, and showed that potassium hydroxide solution dissolved some of, but not all, the dissociation products It was suggested that the insoluble gases were lower fluorides such as SF_4, SF_2 or S_2F_2 The pressure of sulphur hexafluoride was slightly greater than atmospheric, and corona discharge ran for periods of 50–200 hr with currents in the range 50–200 microamp

The relative abundances of the positive ions formed by electron bombardment in sulphur hexafluoride were determined using a 60° Nier-type mass spectrometer The sulphur hexafluoride, at a pressure of about half an atmosphere, was contained in a small glass discharge tube (30 c c capacity) with point–point tungsten electrodes, the gap spacing being 1 3 cm. The relative abundances were determined over a period of days for the same sample (Table 1), small beams of O_2^+, N_2^+, Hg^+, Hg^{++} and H_2O^+ were also present

The changes in abundance of the ion species were investigated for three different values of discharge current No attempt was made to calculate accurately these currents, nor to have the same conditions of pressure throughout the three trials, as it must be stressed that the investigations were made to find in a preliminary sense the changes taking place due to the discharge, rather than attempting an accurate quantitative investigation. After each of the three trial runs, the tube was thoroughly cleaned with a hot concentrated solution of sodium hydroxide to remove the silicates formed as a result of the discharge. The first discharge was run at 0 40 m amp (pulse frequency ~ 1/sec) for 15 min No appreciable change was observed in the abundances given in Table 1

The second discharge was run at ~ 60 m amp. (frequency ~ 1/sec) for two hours Mass spectrometer investigations showed that no SF_5^+, SF_4^+, SF_3^+, SF_2^+ or SF^+ were present, but that there was an increase in the intensity of the F^+ beam, and beams due to SiF_4^+, SiF_3^+, SO_2^+ were observed together with other beams of as yet unidentified ions

The third discharge was run at ~ 10 m amp. (frequency ~ 1/sec) for 30 min. Beams due to SF_5^+, SF_4^+, SF_3^+, SF_2^+ and F^+ were observed, together with those found in the second run Several measurements of relative abundances were made and the mean values of these determinations and those for the undischarged sulphur hexafluoride are compared in Table 2

Table 2

Ion	Relative abundance	
	Before discharge	After discharge
SF_5^+	100	100
SF_4^+	9 3	9 5
SF_3^+	22 8	24
SF_2^+	3 4	28
F^+	1 3	400–1,000

From these experiments, it is seen that under certain discharge conditions a change in the ion species of sulphur hexafluoride is observed, as would indeed be expected Although no attempt has been made to carry out a rigorous investigation, we have established the fact that appreciable permanent molecular dissociation accompanies the discharge, as shown by the increase in the F+ abundance in runs 2 and 3. This increase in F+ is to be expected, as the final products should clearly be sulphur and fluorine, but the completeness and speed of the reactions leading to the formation of fluorine are surprising.

The increase in the abundance of SF_2^+ is unexpected, as it would be thought more likely that the intermediate changes in the reaction $SF_6 \rightarrow S + 6F$ would involve changes in the relative abundances of SF_5^+, SF_4^+ and SF_3^+.

A Molecular Approach to the Problem of Viscoelasticity

As a first step, the type of material considered is that coming under the generic heads of 'paper' and 'board'. These materials are made of cellulosic fibres which are filtered off as sheets from liquid suspensions and dried to give the final product. The bonds between the fibres are almost entirely made up of hydrogen bridges between cellulosic and hemicellulosic components.

The rheological curve obtained may be represented by Fig 1. The material has all the usual time-effects of viscoelasticity. Under constant load it creeps, and under constant extension it relaxes; consequently it shows hysteresis, and the stress/strain curve is dependent on the rate of application of load or the rate of stretching.

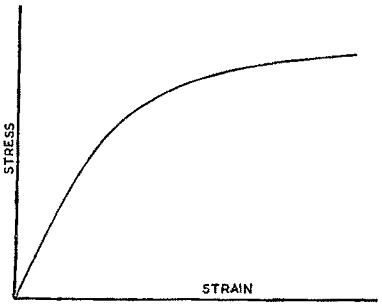

Fig 1 Stress-strain behaviour of paper

The theory proposed here is that when such a material is strained by $(\delta\sigma)$, showing a stress, f, the energy input $(f\delta\sigma)$ simply goes to raise the hydrogen bond potential from $-U_0$ at equilibrium to $(U = -U_0 + \delta U)$ Taking infinitesimal quantities, then,

$$f = dU/d\sigma. \qquad (1)$$

It only remains to select a function $U(\sigma)$ to evaluate (1). The Morse[1] function, rearranged from its usual form, is .

$$U = U_0 [\exp(-2a\sigma) - 2\exp(-a\sigma)] \qquad (2)$$

Thus, differentiating and expanding (2) gives

$$f = 2a^2 U_0 [\sigma - \frac{3}{2} a\sigma^2 + \frac{7}{6} a^2\sigma^3 - - -] \qquad (3)$$
$$= E\sigma - K\sigma^2 + - - - - ,$$

where $E = 2a^2U_0$ and $K = 3a^3U_0$. In these equations U_0 is in units of energy per unit volume, not per mole.

Equation (3) not only fits the curves obtained for these viscoelastic materials well, but also has the merit of depending on two parameters both of which should be, in principle, deducible from non-rheological data. Thus a can be evaluated rheologically as $(2K/3E)$ or spectroscopically from the infra-red absorption of cellulose. Rheological data give $a = 16·8 \pm 3$, whereas spectroscopy yields $a = 19·4 \pm 2$. The agreement may be considered as not unsatisfactory. Physically a is connected with that compressional strain σ^* which is necessary to raise the hydrogen bridge potential from $-U_0$ to zero, by $a = (\ln 2/\sigma^*)$. Similarly, U_0 is connected with the molar heat of dissociation of the hydrogen bond φ_0 by $[U_0/\varphi_0] = R$, where R is the number of moles of hydrogen bonds per cm ^{3} of tested material which are subjected to strain

According to this theory, time-effects are due to the fact that since the hydrogen bond is a weak link it breaks under strain. Thus R continually decreases with time and the problem resolves itself into a problem of chemical kinetics. Re-formation of the weak bonds gives rise to certain appearances of hardening under some conditions

The choice of the Morse function for the bond potential is somewhat arbitrary, other functions have just as much justification. It is a very convenient function for the purpose, but it suffers from one drawback. This function gives a maximum for f at a strain $\sigma = (\ln 2/a)$. Thus it cannot be applied for materials with $a \sim 20$ beyond a strain of 0·03 or thereabouts. For paper and board this is immaterial, as they normally break at lower strains, for other cellulosic materials this fact sets a limitation on the theory and equations. Cotton yarn, for example, does not yield such useful results as paper and board; probably other functions are required

I am indebted to Dr L Peters, of this Department, for many discussions and for the suggestion to use the Morse function. It is hoped to publish a more detailed treatment of this theory elsewhere.

Infra-red Absorption Spectrum of Fluoropyruvic Acid

Mager and Blank[1] have reported the synthesis of fluoropyruvic acid and claim that its infra-red spectrum shows an absorption band at 980 cm $^{-1}$, which they assign to the C—F stretching vibration. This frequency is outside the range normally assigned to this vibration[2], and differs markedly from that suggested[3] and afterwards found[4] for this vibration in fluorocitric acid

An opportunity has recently occurred to examine a sample of fluoropyruvic acid synthesized by the

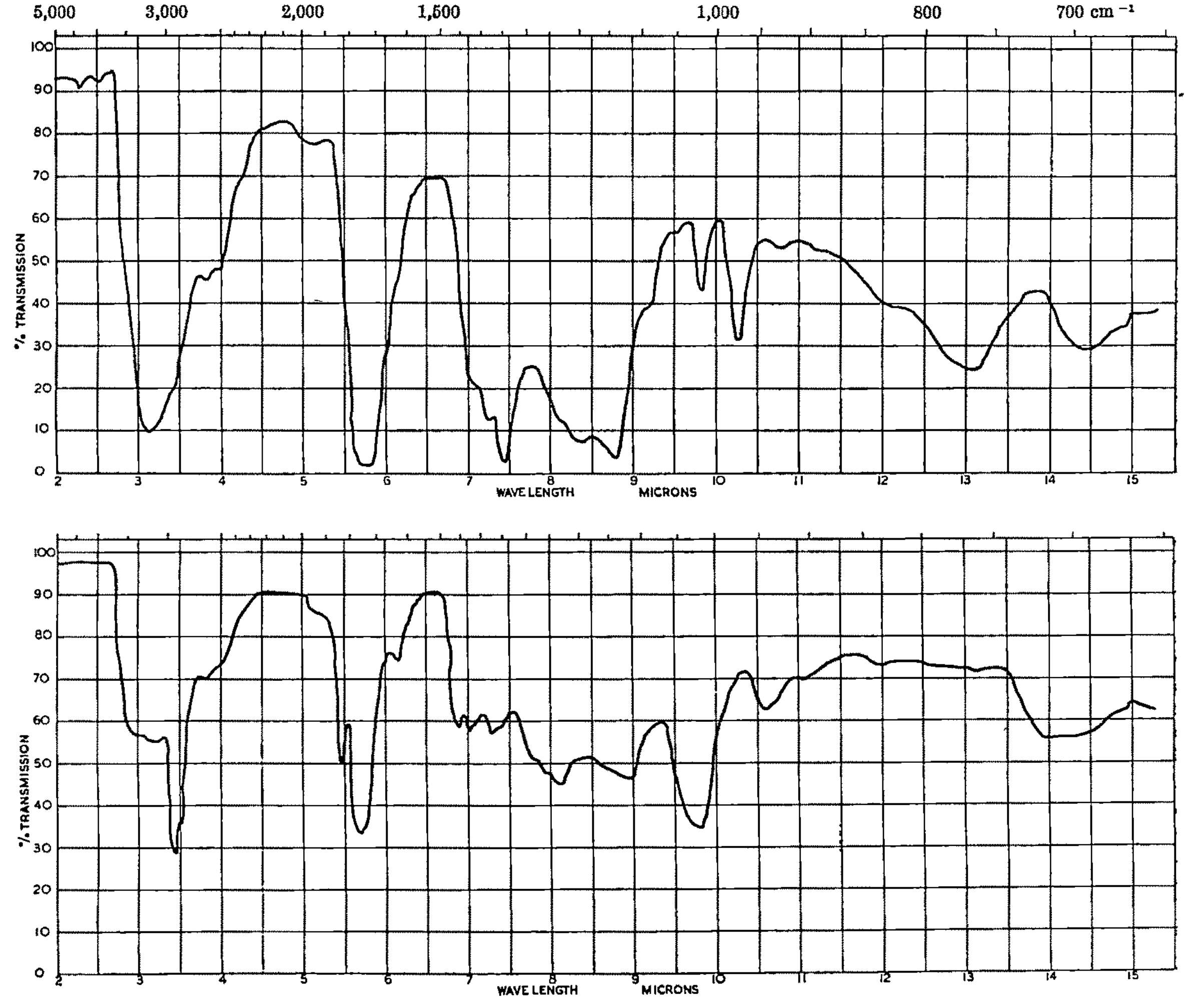

Fig 1 Upper spectrum, pyruvic acid, lower spectrum, fluoropyruvic acid

route described[1], and the infra-red absorption spectrum of the compound has been examined Comparison of its spectrum (Fig 1, lower) with that of pyruvic acid (Fig 1, upper) suggests that the band which should be assigned to the C—F stretching vibration occurs at 1,022 cm $^{-1}$ This is within the accepted frequency-range for this vibration and is in close agreement with the frequency of the corresponding band (1,026 cm $^{-1}$) in the barium salt of fluorocitric acid The absence of a band at the claimed frequency of 980 cm.$^{-1}$, and the observation that the wave-length of the observed band is 9 78 μ, suggest that the previous authors may have inadvertently quoted wave-length as wave-number.

Formation of Aquo Ions

IN two publications on this general topic, Bjerrum and Jørgensen[1], and Jørgensen[2], have reported on the absorption spectra in ethanol–water mixtures of cobaltous nitrate, among other salts. They conclude from their results that the spectral changes observed are due primarily to exchange between alcohol and water groups on the cation They suggest in particular[1,2] that the conclusions of Katzin and Gebert[3], based on studies with varied solvents and experimental conditions, to the effect that the spectral changes between water solution and solutions in organic solvents are due primarily to cation–anion complex interaction are therefore in error

The implication of the Bjerrum–Jørgensen interpretation is that the spectral effects discussed should be independent of the anion, when dealing with anions no more strongly complexing than nitrate ion. In particular, it would be expected that cobaltous perchlorate should show the same effects, since perchlorate is notoriously a poor complexing anion.

Fig 1 shows curves of optical density (1 cm. path-length) against wave-length for (*a*) aqueous cobaltous nitrate, (*b*) cobaltous nitrate in ethanol, and (*c*) cobaltous perchlorate in ethanol. All three refer to the same concentration of cobalt (0 0199 *M*), and the two alcoholic solutions have the same water con-

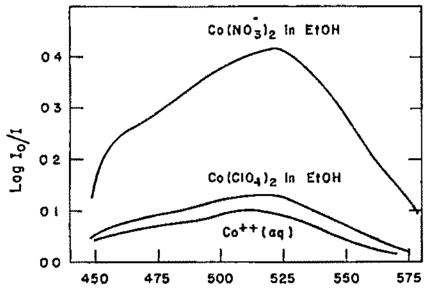

Fig 1

centration by Karl Fischer reagent titration (1 3 per cent). It is clear that the absorption of the alcoholic nitrate is more than four times that of the aqueous solution, whereas the perchlorate solution differs by less than 30 per cent from the aqueous spectral density.

Since measurements on nickelous nitrate have also been cited[2], we can furnish comparisons of perchlorate and nitrate spectra for this case too (Fig. 2) Instead of making solutions of both salts, however, we have added a lithium nitrate solution to the perchlorate solution, to make certain conveniently that the metal ion concentration is the same. The intensity relations are completely analogous to the cobalt situation, for both peaks of the nickel spectrum With copper[2], there is a bigger difference between the aqueous and the alcoholic perchlorate spectra than for the preceding (possibly related to a more ready formation of copper complexes with univalent anions) , but addition of lithium nitrate still increases the optical density, and shifts the spectrum.

We have also shown earlier[3] that shifts or intensity changes of the cobaltous nitrate spectrum larger than for ethanol solution are given not only in the alcohols heavier than ethanol, but also in acetone, which by all criteria is recognized as a weaker electron donor than the alcohols. Finally, it has also been shown in the cases of the nitrates discussed above that there is a drastic alteration of the characteristic absorption of the nitrate ion, when in alcoholic solution together with the cations listed, which is ascribable to some intense interaction such as would occur with complex formation[3,4].

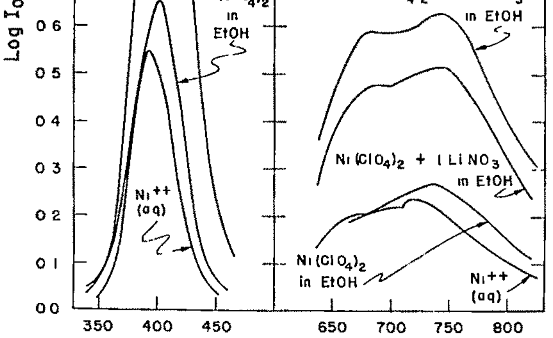

Fig 2

It seems a reasonable conclusion, the calculations of Bjerrum and Jørgensen notwithstanding, that the basic spectral alterations of the divalent cobalt, nickel and copper nitrates in ethanol solution are due to cation–anion interaction, and not primarily to water–alcohol replacement on the metal ion One might also raise a doubt whether this water–alcohol replacement hypothesis should be considered proved in other cases where the only evidence is agreement by calculation[1,2].

[4] Katzin, L I , *J Chem Phys* , 18, 789 (1950)

In the preceding letter, Katzin and Gebert are criticizing the conclusions drawn by us on the formation of aquo ions[1,2] The transition group elements were originally studied as nitrates in alcoholic solution, since the nearly anhydrous alcoholic solutions of perchlorates are liable to explode violently After the publication of the second paper[2], we have used perchlorates and other non-complexing salts and found qualitative agreement with the new results of Katzin and Gebert We do not agree, however, with all the conclusions drawn from these observations

At the maximum of the absorption band of cobalt(II) salts with non-complexing anions, the molar extinction coefficients ε are about 60 per cent higher in nearly anhydrous ethanol than in water, and not 30 per cent as measured by Katzin and Gebert in 0 7 *M* water solution Since cobalt(II) perchlorate, *p*-toluenesulphonate and trifluoroacetate all show the same spectra in ethanol and the same changes on addition of small quantities of water, it is most probable that these changes correspond to the real exchange of ethanol with water in the hexa-solvatized cobalt(II) ion, while we recognize that anion effects are superposed on the solvation effect by the much larger change in cobalt(II) nitrate solutions. Fig. 1 shows that cobalt(II) *p*-toluene-sulphonate has its mid-point of change by addition of water (in our opinion the average formation of $Co(H_2O)_3(C_2H_5OH)_3{}^{++}$) at a water concentration of about 2 0 *M* at 25° C , and the corresponding value for the nitrate is 0 92 *M* [2].

The strongly coloured compound in nearly anhydrous solutions of cobalt(II) nitrate is presumably not an electrostatic associate with the nitrate ion outside the solvation shell. Recently, the crystal field-theory has been applied to the absorption spectra of the transition group ions[3,4]. It is improbable that long-range effects will be observable in the spectra, and nitrato-complexes usually have their bands at slightly shorter wave-lengths than the corresponding aquo ions Experimentally, the electrostatic associates, which undoubtedly exist in cobalt nitrate solutions in carbon tetrachloride with

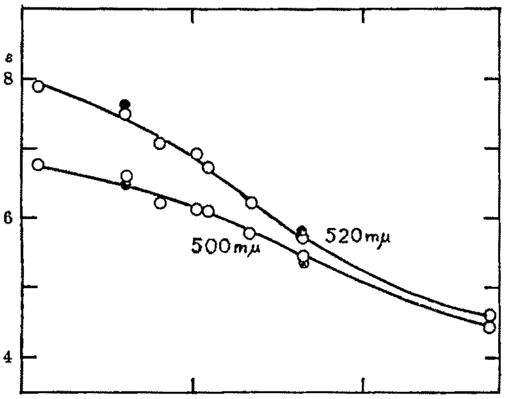

Fig 1 Molar extinction coefficient of cobalt(II) p-toluenesulphonate at 520 and 500 mμ as a function of the water concentration C_{H_2O} on a logarithmic scale

C_{Co} = 0 006 M (open circles) and 0 06 M (filled circles)

some water and ethanol, have been found[2] to have nearly the same spectrum as the pure aqueous solutions.

Fig. 2 shows the molar extinction coefficient of cobalt at 520 mμ as a function of the ratio between ammonium nitrate and cobalt, $C_{NO_3^-}/C_{Co}$ at different concentrations of cobalt(II) p-toluenesulphonate and water. (Measurements carried out at 500 and 480 mμ give analogous results.) It is seen from the slope of curve 1 that a mono-nitrato complex is formed with so large a formation constant (> 200) that dilution to 0 006 M cobalt has not much influence on the steep increase of ε caused by the nitrate first added at low concentrations of water. At larger values of $C_{NO_3^-}/C_{Co}$ there seems to be some difference at the same water concentrations, but the activity corrections for variable salt concentrations are difficult to estimate It is not certain that a di-nitrato complex is formed to any great extent, and the formation is at least far from complete at $C_{NO_3^-}/C_{Co} \sim 2$, as is also shown by the conductivity of cobalt(II)nitrate in ethanol[1] In the higher alcohols and ketones di-nitrato complexes are more stable, and colour is more intense than in ethanol, as is pointed out by Katzin and Gebert.

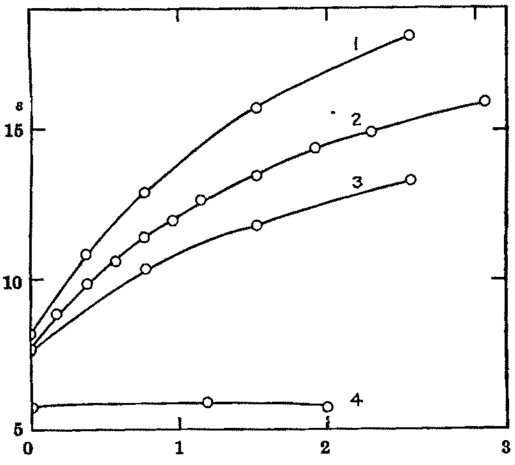

Fig 2 Molar extinction coefficient of cobalt at 520 mμ as a function of the ratio between the concentration of ammonium nitrate and of cobalt p-toluenesulphonate

Curve 1, C_{Co} = 0 006 M, C_{H_2O} = 0 08 M, curve 2, C_{Co} = 0 06 M, C_{H_2O} = 0 43 M, curve 3, C_{Co} = 0 006 M, C_{H_2O} = 0 43 M, curve 4, C_{Co} = 0 06 M, C_{H_2O} = 4 0 M

Curve 4 of Fig. 2 shows that at a water concentration of 4 M, a large excess of ammonium nitrate is without perceptible effect on the spectrum of cobalt(II) p-toluenesulphonate. Also ε at 520 mμ of a solution of 0 006 M cobalt, 0 36 M ammonium nitrate, is 23 4 at 0 1 M water, but only 6 2 at 4 M water. The order of affinity to the metal ion of ligands is, according to the term 'electron donor strength' of Katzin and Gebert

$$H_2O > NO_3^- > C_2H_5OH$$

which is a reasonable explanation of the strong influence of water on the complex equilibria. But since water is only eight times more strongly bound than ethanol[2] to cobalt(II) p-toluenesulphonate (where formation of anion complexes can scarcely be the explanation of the spectral change at a relatively large water concentration compared with the case of nitrate), the special tendency of the ethanol-solvatized cobalt ion to take up nitrate ions is peculiar Perhaps steric reasons are responsible for the easy removal of one or two of the alcohol molecules, while the hexa-aquo ion is more stable towards uptake of nitrate ions The stability of the nitrato-complex increases with the temperature This can be observed qualitatively in boiling ethanol, where the persistence of the strong colour on addition of water is remarkable

The nitrate ion has not such a disturbing influence in all of the cases investigated Bis(ethylenediamine)-copper(II) ions do not seem to show anion effects, since the perchlorate, the nitrate and the chloride have the same spectra in pyridine, which has a lower dielectric constant than ethanol and is bound more weakly than water to Cu en_2^{++}. The spectra of this ion in water, methanol, ethanol and pyridine are all different, showing no common non-solvatized form.

The suspicion thrown on solvation phenomena in general cannot be justified in the case of inner-complex salts without anions As will be shown later, nickel(II)bis(acetylacetonate) in benzene shows distinct changes of absorption spectrum by addition of ethanol (water precipitates the dihydrate), and nickel-(II)bis(formylcamphor)ethylenediimine in benzene is solvated by methanol.

Ranges of Low-Energy Electrons in Protein

A KNOWLEDGE of the effective range of low-energy electrons in protein is of considerable biological interest. The ranges as calculated by Lea[1] from the Bethe theory of energy-loss cannot be accepted without experimental verification, since the validity of the assumptions made in the computations are questionable at the low energies. The sensitivity of small biologically active molecules to radiation can be used to measure the ranges by employing a layer of enzyme of thickness greater than the range of the electrons as an absorber. If a thin, uniform layer of dry enzyme is irradiated with a sufficiently large number of electrons, all the enzyme within the range of electrons is inactivated. After irradiation, the enzyme is assayed for remaining activity, knowing the amount inactivated, the surface area irradiated and the density of the material (taken as 1.3 gm./c.c.)[2] the range of the electrons in the enzyme can be found. Irradiations using the enzyme invertase[3] have already been carried out, and the ranges found were significantly less than those calculated by Lea. The size of the enzyme molecule itself prevented any measurements being made at energies less than 600 eV, for at that energy a layer one enzyme molecule in thickness was inactivated. The inaccuracies of the assay made the determinations at energies greater than 1,500 eV. uncertain.

These measurements have now been extended using deoxyribonuclease; the enzyme as well as the deoxyribonucleic acid for the assay were supplied by Worthington Biochemicals, Inc.; the assay was that of Kunitz[4]. Due to the smaller size of the molecule, accurate determinations of the ranges could be made down to energies of 300 eV. At energies smaller than this, the observed range became constant at a value of 60 A., corresponding to a layer one molecular diameter in thickness (see Fig. 1). High-energy radiation studies on deoxyribonuclease[5] have shown it to have a molecular weight of 62,000, and it is thought to be spherical with a diameter of 56 A. Between 300 and 1,500 eV, the range measurements agree remarkably well with those made using invertase. Above 1,500 eV, the ranges are in general somewhat lower than those given by the invertase measurements, showing a greater discrepancy from the theoretical curve.

The work of Alper[6] on the ranges of electrons in air, when corrected for the differences in density and stopping power between air and protein, also shows the experimentally determined ranges to be less than the theoretical values in the low-energy region. The quantum mechanical treatment of energy-loss is expected to break down when the velocity of the incident electron is such that the electron spends a finite length of time in the field of the absorber atom and therefore suffers one or more collisions. The experimental values are therefore more nearly correct for the ranges of low-energy electrons (delta-rays being of considerable interest) than those obtained by extrapolation of the curve valid at high energies

Effect of Oxygen on the Radiosensitivity of Growing Bone and a Possible Danger in the Use of Oxygen during Radiotherapy

THAT oxygen tension has an effect on the radiosensitivity of living tissue has been known for many years, and the subject has been recently reviewed[1]. The effect was studied by Read[2], who established the form of the curve relating oxygen tension and radiosensitivity for a plant tissue. An essentially similar relation has been shown to hold for a wide variety of plant and insect tissues, though comparable data on mammalian tissue is still far from complete. The effect of partial anoxia on the lethal dose of whole-body irradiation has been investigated[3], but we are not aware of quantitative data on radiosensitivity at a variety of partial pressures of oxygen for either the local irradiation of tissue in the intact animal or whole-body irradiation.

The possibility that increasing the partial pressure of oxygen in the respired gas might improve the radiosensitivity of tumours differentially in comparison with surrounding normal tissue[4] has encouraged radiotherapists at a number of centres to administer oxygen to patients during radiotherapy for malignant disease. It has therefore become important to assess the effect of varying oxygen tension in the gas respired by mammals on the radiosensitivity of their tissues. While the change in radiosensitivity on breathing pure oxygen of a well-oxygenated tissue such as skin may not be large, there is the possibility that certain poorly vascularized tissues such as cartilage or bone might show a greater effect. This increase may be of particular concern in the case of bone. If the effectiveness of the irradiation on bone is increased because of a higher oxygen tension, there will be a greater risk of effects of high doses, such as necrosis, occurring after the delivery of the normal therapeutic dose[4]. This consideration will be of special importance if the treatment is given with X-rays from equipment working at a potential of 500 kV. or less, because of the greater absorption of energy in bone relative to soft tissue[5].

For these reasons we have made a study of the change of radiosensitivity of growing mammalian bone. The tails of groups of 7-day old *C57* black mice, breathing gas mixtures containing various partial pressures of oxygen, were irradiated with a single dose of 190 kV. X-rays. When anoxia of tissues was required, a cuff was fitted over the tail and a pressure of 280 mm. mercury applied. Three weeks later, the growth of the irradiated tails was com-

Table 1

	Anoxia	Partial pressure of respired oxygen (atmospheres)				
		0 1	0 2	0 4	1	3
Radiosensitivity* Standard error	0 0734 ± 0 0025	0 097 ± 0 006	0 145 ± 0 005	0 166 ± 0 009	0 188 ± 0 010	0 196 ± 0 009
Relative radiosensitivity Standard error	1 00 —	1 32 ± 0 10	1 97 ± 0 10	2 27 ± 0 15	2 56 ± 0 16	2 67 ± 0 13
Doses used (roentgens)	1,500 2,000 3,000	1,500 2,000	500 1,000 1,500	375 750 1 000	375 750 1,000	375 750 1,000

* ($\log_{10}$ control growth − $\log_{10}$ irradiated growth, mm)/dose K roentgens This formula is used to calculate the radiosensitivity because the curve relating growth with dose appeared to be more nearly exponential than linear

pared with that of litter-mate controls. Groups of six animals were used for each of three doses at each partial pressure of oxygen (except 10 per cent). The results of these experiments are given in Table 1.

The increase of radiosensitivity observed on changing the respired gas from air to oxygen at one atmosphere was 1 30 ± 0 06. Whether this factor applies to other tissues in mice or to analogous tissues in man remains to be seen However, the results presented here suggest that there may be danger in giving the same dose to a patient breathing oxygen that is normally given when breathing air. We hope to report the results more fully elsewhere.

Relation of Magnesium Supply to Growth and Net Assimilation-rate in Barley

IN recent years attention has been directed to the increasing incidence of magnesium deficiency in crop plants[1], and it is also possible that such a deficiency may cause disease in ruminants grazing on affected herbage[2]. Using the methods of growth analysis[3], a study is being made of the effect of this element on carbon assimilation in plants

Barley plants (var Plumage Archer) were grown in an unheated greenhouse in unaerated water cultures at eleven magnesium concentrations, varying from 0 to 300 p p m Magnesium was added as $MgSO_4 7H_2O$, the concentration of the sulphate radical being kept constant over the range of 0–100 p p m of magnesium, by the addition of sodium sulphate No sodium sulphate was added to the 300 p.p.m. solution Each treatment was replicated four times 300-ml soda glass jars were used, and three plants were grown in each The solutions were changed weekly and the *p*H adjusted to 6 0

The seed was sown in sand on March 26, 1954, and the seedlings transferred to water culture on April 8 Leaf areas and dry weights of whole plants were determined on April 8 and after 24 days growth in water culture Leaf areas were calculated using a leaf-index method[4]. At the end of the experiment the total magnesium content of the leaves was determined by the method of Mason[5].

Where the magnesium supply limited growth, some leaves died before the final sampling and others were completely chlorotic. Thus it seemed possible that differences between the net assimilation-rate of magnesium-deficient and normal plants might be due in part to the increased rate of senescence of the leaves of the former. In order to minimize this effect, the leaf areas of withered leaves at the final sampling date were not included in the final leaf areas Their dry weights were, however, included in the final dry weights This procedure was necessary for plants growing in solutions of magnesium concentration 0–1 23 p p m Thus the net assimilation-rate calculated for these plants will have been overestimated, since leaves dead at the final sampling date will have been actively assimilating at some time during the experiment. An abbreviated summary of the results is presented in Table 1, and graphically in Fig 1

Thus an increase in the concentration of magnesium in the nutrient solution from 0 41 to 3 7 p p m. resulted in a large and significant ($P < 0\ 001$) increase in net assimilation-rate and total dry weight. The magnesium concentration in the leaves of these plants increased from 0 07 to 0·12 per cent This also is a significant increase ($P < 0\ 001$) when the angular conversions of these values are statistically analysed. The net assimilation-rate did not vary significantly in plants in which the foliar concentration of magnesium ranged from 0 12 to 0 57 per cent.

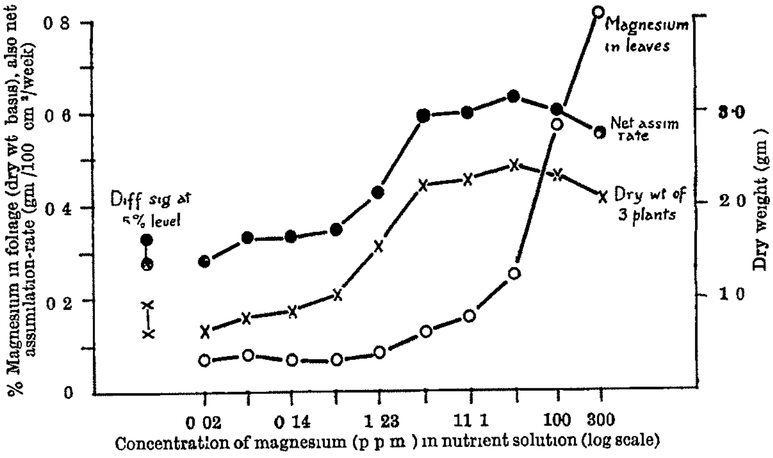

Table 1

Treatment	III	V	VI	VII	VIII	X	XI	Diff sign at 5 per cent level
Magnesium in nutrient sol (p p m)	0 05	0 41	1 23	3 7	11 1	100	300	
Final dry weight of 3 plants (gm)	0 80	1 05	1 57	2 20	2 27	2 31	2 09	0 23
Net assimilation-rate (gm /100 cm ²/ week)	0 33	0 35	0 42	0 59	0 59	0 60	0 55	0 05
Per cent magnesium in leaves (dry matter basis)	0 08	0 07	0 08	0 12	0 16	0 57	0 81	*

* An analysis of variance of the angular conversions of these values indicates that a significant difference ($P < 0\ 05$) exists between all treatments except between III, V and VI

The coefficient of variability for net assimilation-rate data in this experiment was 7 14 per cent.

It is tentatively concluded that the 'critical concentration'[6] of magnesium in young barley leaves is approximately 0 12 per cent. Below this value, both total dry matter accumulation and net assimilation-rate are reduced This work is being reported fully elsewhere

Occurrence of the Root-knot Eelworm, *Meloidogyne hapla*, out of doors in Great Britain

UNTIL recently, only one species of root-knot eelworm was recognized, namely, *Heterodera marioni* (Cornu). Renewed interest has been stimulated with the transfer of the eelworm to the genus *Meloidogyne* and the erection of a number of species[1]. In Great Britain, infestations of root-knot are most often recorded under glass, attacking tomatoes, cucumbers and various other glasshouse crops When attacks occurred in the open, it was usually assumed that the eelworm had originated from glasshouses. Some attacks occurred on sites where glasshouse soil was known to have been deposited, and these infestations appeared to die out fairly rapidly, usually within about two years, and Franklin[2] has shown that a population obtained from a glasshouse persisted out of doors in pots for at least sixteen months On other occasions, however, it has been difficult to associate the presence of the eelworm out of doors with a glasshouse source. Triffitt[3] has recorded an attack on carrots and parsnips on a field which, so far as could be ascertained, had not been contaminated with soil from glasshouses Since 1931 there has been a number of other records (*in litt*) of attacks in the open on various crops including carrots, parsnips, pyrethrums and scabious, but there must always be some doubt as to whether the eelworm had come from glasshouses

During the past three years, a number of severe attacks have occurred on various crops in several fields in the eastern counties of England. Here there was no possibility of contamination with glasshouse soil, and it was clear that these attacks were being caused by a species of *Meloidogyne* which thrived out of doors. The symptoms caused were quite distinct from those seen on glasshouse plants, the most striking difference being in the size of the galls Plants attacked by the species in glasshouses develop large galls with little or no root proliferation, whereas the galls from the outdoor attacks were small, usually not more than 3–4 mm. in diameter and often much smaller still, and on many hosts there was a large amount of root proliferation It is probable that the attack recorded by Triffitt was caused by the same species, as she also comments on the small size of the galls.

In the United States, of the species recognized at the moment, only *Meloidogyne hapla* can be identified by the type of galling produced on the plant. Plants attacked by this species develop symptoms similar to those described above for the outdoor attacks in the eastern counties of England, and it was considered most likely that this eelworm was identical with *M. hapla* Confirmation of this has now been obtained from Mr A L Taylor, Section of Nematology, U.S. Department of Agriculture, and it seems reasonable to assume that many of the earlier records also relate to this species, which has probably been long established in Great Britain

Severe damage has been caused to scabious (*Scabiosa caucasica*) on three fields on light sandy soil in the Mildenhall area of Suffolk. Well-established plants were being killed out by the eelworm. The galls were very small, and there was extensive root proliferation There have been complete failures of carrots, mangolds, sugar beet and kale on two fields in the Norfolk breckland, and light attacks on several other fields in the same area. On these plants the galls were also small , but the root proliferation

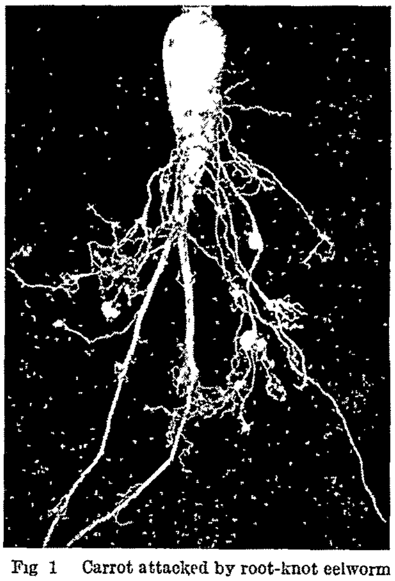

Fig 1 Carrot attacked by root-knot eelworm

was not so extensive as on the scabious Cereals are apparently immune from attack. This area also is very light sandy soil. A large number of weed species has been examined on some of these fields, and many of these are hosts

Thanks are due to Mr. N D N Welford, who has given considerable assistance with the field-work, and to Mr W E Dant for the photograph of the attacked carrot. Investigations into the host-range of this nematode are continuing, and full results will be published elsewhere

Witchweed and Soil Fertility

JONES[1] has recently directed attention to a problem of considerable importance in African agriculture, namely, whether *Striga hermontheca* Benth. infestation is only serious on 'worn-out' soils or whether the 'wearing-out' is due to *Striga* itself.

An agricultural survey carried out in the southern Sudan has shown that, while on comparatively poor lateritic soils *Striga* is practically absent, it causes yield reductions of up to 70 per cent on rich alluvial clays. The reason for this seems simple, on the lateritic soils, soil nutrient exhaustion, due largely to erosion of the uppermost layer where nutrients accumulate under bush fallow, forces the native cultivator to abandon the field after a period of from three to five years, before *Striga* infestation can become serious Moreover, in the areas where these soils occur, good drainage and comparatively high rainfall permit diversified cropping. On the other hand, alluvial clay soils occur in the southern Sudan in areas of marginal rainfall and marginal drainage. *Sorghum*, which can tolerate both drought and, to a lesser extent, water-logging, is in these areas the only crop of major importance. Its cultivation is concentrated on sites less liable to flooding, and on such sites intensive and prolonged mono-cropping with *Sorghum* leads to increasing *Striga* infestation, in time causing serious deterioration of yields Where better drained land is more plentiful and shifting cultivation possible, *Striga* is regarded by the native cultivator as the main reason for abandoning old fields (usually after six to eight years)

Experiments carried out on heavy alluvial soils at Malakal[2] showed no significant response of *Sorghum* yields to application of fertilizers on recently abandoned 'worn-out' land. The comparison of yields of crops not parasitized by *Striga* grown on 'worn-out' land and newly opened-up land also shows no significant difference. On the other hand, owing to depredations of insect pests (mainly *Sorghum* stem-borer, *Sesamia cretica* Led), measures controlling *Striga* infestation resulted in no response in *Sorghum* yields.

Conclusions from the above observations can be summarized as follows (i) *Striga* infestation assumes considerable importance as a factor controlling yields in areas where sites suitable for cultivation, as well as the range of suitable crops, are limited. (ii) On inherently fertile heavy soils, damage due to this parasite reaches the critical level before the appearance of signs of soil exhaustion. (iii) *Striga* is only one of the evils of intensive and prolonged mono-cropping. Its control, for example by selective herbicides, can provide only a partial solution to the problem of *Sorghum* yield deterioration.

Though, in the southern Sudan, soil erosion is generally not serious on the clay plains, owing to lack of slope, on their margins where the slopes are greater, *Striga*, being one of the factors necessitating shifting cultivation, undoubtedly plays an important part in soil conservation. The introduction of an easy method of eradication might, in those areas, lead to over-cultivation and accelerated erosion, which would cause much greater and more permanent damage than the parasite itself.

A Nematode Parasite of *Drosophila*

ADULTS of *Drosophila* spp trapped at frequent intervals in Nature at Dalkeith, Midlothian, were dissected to follow the development of the ovaries, and occasionally the testes, during autumn, winter and spring. The flies dissected were *D subobscura* Coll. (19 males, 338 females), *D. obscura* Fln. (17 males, 92 females), *D. silvestris* Bas. (41 males, 34 females), *D. tristis* Fln. (2 males, 7 females), *D funebris* (Fabr.) (3 males, 11 females), and *D. cameraria* Hal. (3 females). During these dissections a few specimens of the first three species were observed to be infested with a nematode, provisionally identified as *Aphelenchulus* sp. (Allantonematidae Chtw. and Chtw., 1937), probably new. The numbers of dissected flies are shown in Table 1, the figures in parentheses being the numbers of those infested

Over the whole period of eight and a half months, 603 specimens of *Drosophila* spp. were dissected. There were 541 (+ ?36) specimens of the three infested species, of which 18(+1), or 3 3 per cent, were parasitized, the highest parasitism being in *D obscura.* Both sexes were infested All stages of the nematodes have been found in the abdomens of the flies gravid females (6 averaging 488 μ × 115 μ), eggs and young larvæ. As many as fourteen gravid females have been found within a single fly. Eelworm larvæ were sometimes especially abundant within the

* Trapped in December but held over until January

ovaries, which latter were then stunted and the eggs were not developing. This situation is presumably the start of larval migration from the host. In the four infested males, however, the testes appeared normal and larval eelworms were not observed within these organs.

The larval eelworms showed the beginnings of differentiation into males and females. By analogy with other species of nematode parasites of insects, it appears possible that the larvæ come to maturity in a free-living state, outside the host. Possibly, also, it is the larva of *Drosophila* that is infested by the entry of spermatized but immature female eelworms, which gradually develop during the metamorphosis of the fly. Another nematode, *Tylenchinema oscinellae* Goodey, during the winter months parasitizes the larva of the fritfly (*Oscinella frit* L.) and passes over into the adult fly which emerges in May[1]. It is not known, however, whether larvæ of the above three species of *Drosophila* survive the winter, though Basden (unpublished) finds that *D. silvestris* passes this period in a puparium.

There appear to be two other records of parasitism of *Drosophila* adults by nematodes. Van Zwaluwenburg[2] cites Crawford as having found the larvæ of *Habronema megastoma* (Rud., 1819) (Spiruridae) in an undetermined species of Drosophilid in Ceylon in 1926, and Gershenson[3] found that most individuals of *D. melanogaster* Mg. and all those of *Parascaptomyza disticha* (Duda) (Drosophilidae) caught near Kiev were infested with a species of *Chondronema* (Allantonematidae).

The investigation is being continued in greater detail. We are grateful to A. A. Spence for many of the dissections.

A Method of isolating Vesicular Arbuscular Endophytes from Roots

THE exact systematic position of the vesicular arbuscular endophytes has been a topic of some controversy. In 1900 Dangeard[1] proposed the genus *Rhizophagus* for these fungi, and considered that they were closely related to the Endogonaceae, but that they had lost the ability to form compound fructifications. Peyronel[2] also considered that these endophytes closely resembled *Endogone*.

Nicholls[3], working in this Department, made a preliminary study of the endophyte present in the roots of *Allium ursinum* and pointed out the morphological similarity of this organism to certain Oomycetous fungi. From portions of root, surface sterilized with a solution of sodium hypochlorite, washed and placed on plain agar, she frequently isolated a strain of *Pythium ultimum*. Owing to the sensitivity of this fungus to the hypochlorite solution, this isolation technique often failed, while less severe surface sterilization of the roots allowed common soil fungi, notably species of *Fusarium*, which were probably present as surface contaminants, to develop on the isolation plates to the exclusion of *Pythium*.

A more direct method of isolation of the endophyte has now been devised. Roots are thoroughly washed under the tap and then transferred to a flask of sterile water in which they are vigorously shaken for a few minutes. This process is repeated three more times, after which longitudinal sections of the roots are cut under aseptic conditions. The sections are then transferred to a sterile coverslip and covered with a few drops of plain agar which contains 0.2 ml. aureomycin per 15 ml. of medium. The coverslip is then sealed on to a glass ring as in the preparation of a hanging-drop chamber. The sections are examined daily until one of the intercellular hyphæ grows out from the cut edge. This hypha is then picked up and transferred to a plate of plain or malt agar.

The washing treatment is successful in removing most of the contaminating rhizosphere fungi, as roots treated in this way show only occasional growth of common soil organisms, and the position of these on the surface of the section can easily be seen. The addition of aureomycin to the agar inhibits the growth of any bacteria still adhering to the root.

By the use of this method, *P. ultimum* has again been isolated from infected roots of *Allium ursinum*.

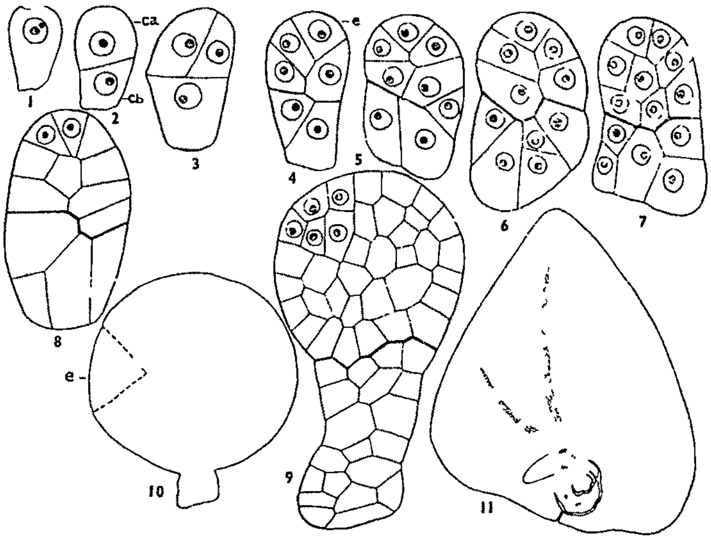
Embryo Development in Areca-nut

EMBRYO development in Palmae is unknown. There is only one description relating to the mature embryo of coconut, by Selvaratnam[1], who compared it with the embryo of Gramineae. The present communication describes the embryo development in *Areca catechu* L., commonly known as the areca-nut or betel-nut palm.

The first division in the fertilized egg (Fig. 1) is transverse and results in two cells *ca* and *cb* (Fig. 2). The latter divides first by a vertical wall and then in all planes. Its derivatives contribute to the formation of the suspensor, which becomes detached from the embryo proper in advanced stages. The terminal cell *ca* divides by an obliquely vertical wall resulting in two rather unequal cells (Fig. 3), the bigger of which undergoes a further division by a slanting wall. As a result, a triangular cell, the epiphyseal initial (Fig. 4 *e*), distinguishable from the rest by its shape and position, is formed. The derivatives of this cell give rise to the stem tip, while those of the sub-epiphyseal cells contribute to the formation of the cotyledon and the rest of the embryo proper. During the development of the embryo, there is a marked growth of the cotyledon on one side, resulting in the shifting of the position of the stem tip as shown in Figs. 5–10. As the embryo proper is exclusively derived from the products of *ca*, the embryo development in *Areca catechu* conforms to the onagrad type of Johansen[2]. So far the formation of an epiphysis in any monocotyledon showing the onagrad type is not known.



Figs 1–11. Embryo development in *Areca catechu*
Figs 1–8, × 300. Fig 9, × 250. Fig 10, × 120. Fig 11, × 10

The fully developed embryo (Fig. 11) is conical and measures 4–4.5 mm in length and 3–3.5 mm. in diameter at base. The single cotyledon completely encircles the plumule, leaving only a pore for its emergence during germination. The stem tip stands at an inclination of 170° to the long axis of the embryo and the root tip lies at 70° inclination to the stem tip. Both of them face the micropyle. The plumule shows several leaf primordia, each with some procambial strands. Vascular strands also extend nearly to the tip of the cotyledon from the procambial strands of the primary axis. The cells of the embryo are devoid of reserve food materials. The embryo is surrounded by copious ruminated endosperm in which hemicellulose and starch are stored.

I wish to thank the National Institute of Sciences of India for the award of a senior fellowship during the tenure of which this study was made, and also Prof. J. Venkateswarlu for his help and criticism.

The Vector of an Outbreak of Kala-Azar in Kenya

It has recently been suggested that a new sandfly of termitaries, provisionally designated *Phlebotomus* (*Sergentomyia*) sp. nov. 2, may be the vector of an outbreak of kala-azar in Kenya Colony which has involved more than three thousand Africans[1]. Not only does the sandfly bite man, but also it is widely distributed throughout the epidemic area, and a small proportion are naturally infected with leptomonads in the anterior part of the mid-gut.

The purpose of this communication is to present further evidence incriminating this species. Previous attempts to infect specimens in the laboratory failed; but towards the end of December 1954, a few are believed to have become infected after being fed on the skin lesion of a patient with kala-azar. The lesion, first detected by Dr. P. E. Clinton Manson-Bahr (see following communication), was on the left shin of the patient and looked like a small healed tropical ulcer; it contained abundant *Leishmania*. Of seventy-five *P.* (*Ser.*) sp. nov. 2, fed in batches on the lesion, and dissected five to six days later, four, or approximately 5 per cent, contained leptomonads; three of the infections, all of which were scanty, had reached the anterior part of the mid-gut. Three of the positive sandflies were in a single batch of twenty-seven specimens, and if this batch had been the only one examined an infection-rate of 11 per cent would have been recorded. Five *P. clydei* (a sandfly of gerbil burrows regarded by Kirk and Lewis[2] as a possible vector in the Sudan) were also fed on the lesion but remained negative. During rather similar feeding experiments in the Sudan, the infection-rates for *P. orientalis* (believed to be the chief vector) and *P. clydei* were 7 and 1.8 per cent respectively, development also being of the anterior type[2]. It must be pointed out that the sandflies used in these experiments were 'wild-caught' specimens, and that some of the infections may have been previously acquired in Nature. The work should really be repeated using sandflies bred in the laboratory, but so far we have failed to rear *P.* (*Ser.*) sp. nov. 2 in captivity.

P. (*Ser.*) sp. nov. 2 has been shown to have a natural leptomonad infection-rate of only 1 per cent[1], the source of the leptomonads being uncertain. The sandflies used in the feeding experiments described in this communication were obtained from a termite hill in the kala-azar area, and ninety unfed specimens from the same site were negative on dissection. It therefore seems unlikely that the infections were previously acquired in Nature, although the possibility has not been entirely excluded.

It seems probable that *P.* (*Ser.*) sp. nov. 2 is the vector of the Kenya outbreak, though final proof is still lacking. The other anthropophilic species found in the kala-azar area occur in comparatively small numbers, and only bite man occasionally; none has yet been found infected with leptomonads in Nature.

I wish to thank the Director of Medical Services, Kenya, for permission to publish this communication.

A Primary Skin Lesion in Visceral Leishmaniasis

Skin lesions containing Leishman–Donovan bodies in kala-azar have been recorded from the Sudan. Kirk and Sati[1], and Kirk[2], described a leishmanial skin lesion on the cheek which preceded visceral infection, and Petrov[3] claimed that, in Uzbekistan, kala-azar in children was preceded by skin ulcers.

Little is known about the method of penetration of the body by the *Leishmania* following the bite of the sandfly, and I would suggest that, in some cases at least, a primary skin lesion does occur at the site of the bite, with lymphatic spread to the regional glands and eventually to the viscera. The following case appears to support my hypothesis.

A male African (Mkamba) was admitted to hospital with a respiratory infection which responded to penicillin; when he felt well and was about to be discharged, a moderate generalized glandular enlargement was discovered which proved to be due to leishmaniasis. This was indeed a very early case of an otherwise symptomless and afebrile leishmaniasis. The axillary and groin glands were moderately enlarged. The spleen was palpable just below the left costal margin. The white cell count was 5,000 per c.mm., hæmoglobin 80 per cent and the formol-gel test slightly positive (solid opacity taking more than twenty minutes to develop). On the lower part of the left tibia was a skin lesion 3 cm × 6 cm with a central pink area, resembling a newly formed scar surrounded by a darker hyperpigmented zone. The central portion contained numerous *Leishmania*, and the outer darker area a few only. The left femoral gland was considerably enlarged and it, too, contained *Leishmania*. There were numerous parasites in the spleen, sternal marrow and glands. Blood culture was negative. A section of the lesion on the left tibia showed a central darker area just beneath the epidermis, which proved to be nests of intracellular *Leishmania* together with granulation tissue, large plasma cells, macrophages and newly formed blood vessels. The parasites were massed just beneath the epidermis. This distribution certainly suggests a primary initial leishmanial lesion at the site of the infective *Phlebotomus* bite, with regional glandular involvement and systemic spread.

In a recent series of nineteen untreated kala-azar cases two have shown similar lesions.

This observation is of importance as it suggests comparison with other protozoal diseases, such as trypanosomiasis (the trypanosome chancre).

I wish to thank the Director of Medical Services, Kenya, for permission to publish this communication.

Use of Propylene Phenoxetol as a Relaxing Agent

Lamellibranchia are difficult to narcotize and then to fix without subsequent contraction of the tissues. It has been found that propylene phenoxetol can be used with considerable success to narcotize a variety of lamellibranchs. Using *Cardium edule*, the procedure was as follows. 5 c.c. of propylene phenoxetol was shaken vigorously with 15–20 c.c. of sea-water to produce a fine emulsion which was added to a breffit of sea-water containing actively siphoning specimens. Within half an hour the animals were completely relaxed with the foot protruding between the gaping shell valves and could be fixed in this condition without causing any contraction of the tissues. Sections of material treated in this way show no deterioration of the tissues and no loss of staining properties. Furthermore, relaxed animals, if washed and placed in fresh sea-water, recover and appear to function normally.

In addition to *Cardium edule*, propylene phenoxetol has been used successfully on *Nucula* spp., *Mytilus edulis*, *Arctica islandica*, *Glossus humanus*, *Spisula subtruncata*, and various members of the Veneridae. It is only partially successful with *Mya arenaria*.

Propylene phenoxetol is obtainable from the Nipa Laboratories, Ltd., Treforest, near Cardiff. It is used normally as an active agent against Gram-negative organisms, although Gough and Wentworth[1] found that it could also be used for restoring the natural colour to blood pigments after formalin fixation.

Observations on a Human Tumour in Tissue Culture

In the course of studying 140 human tumours in tissue culture, a rapidly proliferating strain of cells was obtained from epidermoid carcinomatous tissue, part of which came directly from the patient (*H.*) (Jan. 21, 1953) and part from an animal (rat) implantation (Sept. 5, 1952) of cells from the tumour, a slowly growing epidermoid carcinoma of the larynx. The cultures have maintained for two years a consistent growth-pattern closely resembling morphologically the malignant tissue from the patient. The strain, being the first permanent one developed in the series, has been designated the *A* strain. During the first few months of propagation, conditioned medium was employed from cultures made from patients *K.* and *F.*, having epidermoid carcinomas of the neck and cervix respectively. Because of the possibility of the presence of rat cells in the strain, a study (carried out by Dr. J. J. Biesele, Sloan-Kettering Institute, New York) of the chromosomes was undertaken, after a year in tissue culture, which indicated that the cells were of human origin, having characteristic *V*- and *J*-shaped chromosomes.

During the past year, a substrain has developed which can withstand long periods of starvation. The cells which emerge after transferring cultures which have received no attention or renewal of medium for several months are long, thin, small and thread-like. After transferring and feeding for several months, the cells again show the typical epidermoid cancer morphology. These cells, after reversion, are called *Af* (*A* strain fibroblastic) cells. These cells survive freezing at – 20° C. During the transition period, the cells assume a form indistinguishable from normal fibroblasts, and the type of colony changes accordingly. Almost no lysis takes place.

The cultures from which the *Af* strain was derived were made (Gey's technique) on Aug. 10, 1953. Ten *A* cell cultures were taken from the Sloan-Kettering Institute in New York to the Tuberculosis Immunization Research Centre at the State Serum Institute in Copenhagen. During a two-month period the cultures remained at room temperature without the fluid phase. On Oct. 5, 1953, the cultures were removed with trypsin and transferred. The fluid phase was added, and the cultures were rotated at 37° C. for one to two months with no further attention. On Nov. 12 one culture showed fibroblastic outgrowth and was transferred. As outgrowth occurred in other tubes, further transfers were made. The 'fibroblasts' grew actively, and several hundred subcultures were made during the ensuing months.

The fibroblastic cultures were transferred and fed in the routine manner, and gradually during a period of a few months reverted to the original strain pattern of epithelial carcinoma. The cells reverted during experiments done in January and February. By March and April the cells had completely reverted to type, after being dormant (looking like thin threads) or living as transitional fibroblasts for six to eight months. This process of converting dormant fibroblastic cells to active sheet-forming cells has been repeated regularly since then.

The 'hibernating' fibroblastic cultures accumulate large masses of fat.

The small, dormant, thread-like refractile cells in viable cultures which have received no media or attention for six to ten months might be considered a paramorphic type of cell, such as Hadfield[1] has discussed.

Apart from these fundamental observations, the cultures are of practical importance, as they constitute a large supply of stock material that requires no attention or media when not in use. The chance of losing the strain through accidental contamination is also lessened.

The fibroblastic cells appear to be resistant to agents that cause destruction of the epidermoid carcinomatous forms, such as the polio virus (Brunhilde strain obtained from Dr. Herdis von Magnus, State Serum Institute, Copenhagen) and chemical substances.

A more detailed report of the *A* and *Af* cells is in preparation.

Biosynthesis of Hyaluronate

THE formation of hyaluronate by strains of Lancefield Group *A* and *C* streptococci growing in ordinary laboratory media was first shown by Kendall, Heidelberger and Dawson[1] and by Seastone[2]. More recently, it has been demonstrated[3] that the glucosamine and glucuronic acid moieties of hyaluronate are formed from glucose by cultures of these micro-organisms, without rearrangement of the carbon skeleton.

Previously we had reported[4] that glutamine specifically stimulates the formation of bound glucosamine, as hyaluronic acid, by washed preparations of group *A* streptococci incubated at 35° in a simple buffered glucose – salt solution of the following composition: 0·08 *M* sodium β glycerophosphate (anhydrous), 0·028 *M* glucose, 0·02 *M* magnesium chloride, 0·025 *M* inorganic phosphate buffer *p*H 7·0; the final *p*H of this mixture is 7·0. We now suggest, on the basis of further work using washed preparations, that the pathway for the synthesis of the glucosamine in hyaluronate by streptococci is

(*a*) NH_4^+ + glutamic acid → glutamine;
(*b*) Glutamine + glucose (or hexose derivative) → bound glucosamine + glutamate.

Evidence for this suggestion is as follows. (1) Glutamine or ammonium glutamate stimulates the formation of bound hexosamine in aged preparations of washed cells, but neither ammonia nor glutamic acid is separately effective. (2) Methionine sulphoxide, known to inhibit glutamine synthesis from ammonium glutamate in other systems[5], prevents synthesis of bound glucosamine in the presence of ammonium glutamate but not in the presence of glutamine. (3) A close relationship exists between the amount of glutamine or ammonium glutamate taken up by the cells and the bound glucosamine formed; at lower levels of nitrogen source the amount of bound glucosamine–nitrogen appearing approximates to half the total nitrogen supplied. (4) A cell-free extract of streptococci supplemented by 10^{-3} *M* adenosine triphosphate, 0·022 *M* cysteine, 0·025 *M* inorganic phosphate, 0·028 *M* glucose and 0·02 *M* magnesium ion formed glucosamine from glutamine but not from ammonium glutamate; it is not known whether this hexosamine is free or bound into mucopolysaccharide. (5) Very high (80–100 per cent) conversion of nitrogen-15 from ammonium ion into bound glucosamine nitrogen of hyaluronate has been shown in the presence of unlabelled glutamate.

This work, together with the similar observations of Leloir and Cardini[6] for the formation of glucosamine by *Neurospora* extracts, suggests that the above pathway is a general one for the synthesis of hexosamine, at least in micro-organisms. Full details of this work will be published elsewhere.

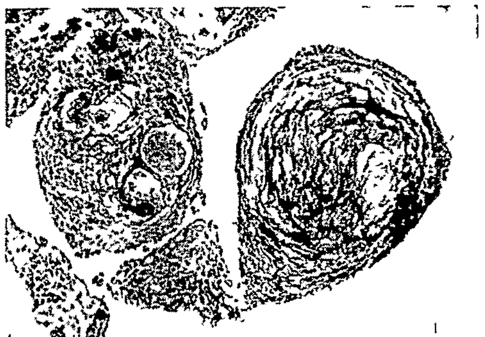
Utilization of Sulphate Ion by Fibroblasts in the Quartz Focus

MUCOPOLYSACCHARIDES are abundant in healing wounds and other sites where collagen is forming, and Meyer[1] postulated their production in large quantities by fibroblasts. The mast cell has been credited with producing 'ground substance'[2] or hyaluronic acid[3], but Bunting and Bunting[4] recently reviewed much of the evidence for the source of mucopolysaccharide in fibroplasia and came to the conclusion that an origin from 'fibrocytes' seemed probable but not conclusive. Klemperer[5] expressed similar views; his objections were based largely on the non-specificity of the periodic acid – Schiff method for mucopolysaccharides. Gersh and Catchpole[6] had postulated previously a secretory cycle in



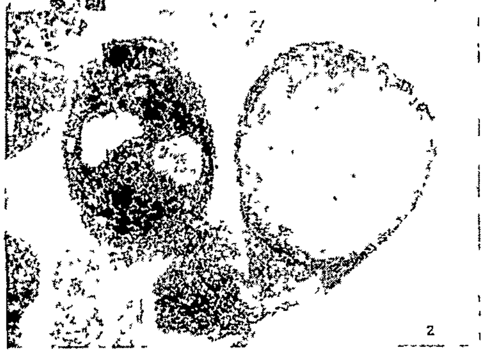


Fig 1 Silicotic foci of 51 days duration in the omental tissues The largest on the right consists mostly of dense collagen with fibroblasts at the periphery The other two are still largely fibroblastic with only early formation of collagen fibres Iron hæmatoxylin and Van Giesen × 80

Fig 2 Concentration of sulphur-35 is low in the mucopolysaccharide of the collagenous focus It is high in the fibroblasts at the periphery of this focus and in those of the cellular foci Autoradiograph × 80

fibroblasts dependent on the specificity of this technique.

Mucopolysaccharides are present in developing quartz foci, in the cytoplasm of fibroblasts and in unphagocyted dust[7] The large cells which invade and phagocytose the dust are stimulated to intense collagen production There is stainable mucopolysaccharide in their cytoplasm, and some is liberated into the focus

In autoradiographs, sulphur-35, given as sulphate ion, is 'fixed' only in the sulphated mucopolysaccharides of the tissues and is present in particularly high concentration within the cytoplasm of cells producing these Mammals are unable to incorporate the $^{35}SO_4$ ion into the sulphur-containing amino-acids, and the trace of sulphur-35 found in cystine is almost certainly formed by the animal's intestinal micro-organisms In this way the autoradiographic method determines accurately only those cells which elaborate mucopolysaccharide

Silicotic foci were produced in the peritoneal tissues of albino mice by the methods already described[7] and lesions of ages from 9 to 120 days were studied Sulphur-35 was administered as sulphate ion at pH 7 and autoradiographs prepared[3]

Sulphur-35 was taken up and retained within the developing quartz foci. Invariably the element was in high concentration only in the cellular fibroblastic zones (Figs 1 and 2) Where fibroblasts were widely dispersed, localization of the ion could be confirmed within their cytoplasm. Only low concentrations of sulphur-35 were present in the extracellular mucopolysaccharide, particularly when this was accompanied by abundant collagen fibres Testicular hyaluronidase (Benger's 'Hyalase') had no effect on the distribution of the radioactive ion. In view of the specific nature of the location of the $^{35}SO_4$ ion within the cytoplasm of cells forming mucopolysaccharide[8], the evidence presented here strengthens greatly the belief that fibroblasts do form and secrete mucopolysaccharides into the surrounding tissues during collagen formation.

"Animal Cytology and Evolution"

We were surprised at the content, and still more at the tone, of the review by Prof. C D. Darlington of M J. D White's "Animal Cytology and Evolution"[1] In our opinion, it would be unfortunate if the many criticisms given under the authority of Darlington's name were allowed to obscure what seem to us the merits of this book White's book contains not only a most useful and critical compilation of scattered data, but also many stimulating discussions of a variety of topics , and it is a valuable part of Dr. White's work that he makes it clear which of his remarks are intended to be factual and which theoretical.

"Independence in Publication"

The subject of Prof. A. V. Hill's communication[1] is one of long standing.

Prof. Elliott Coues published a "Handbook of Field and General Ornithology" in 1890[2] in which he gives instructions for the collection of specimens He lists all the details that should be recorded on labels, including "Name of the person in charge of the [survey, voyage, exploration, or other expedition (if any), during which the specimen was collected] (and it may be remarked that the less he really cares about birds, and the less he actually interests himself to procure them, the more particular he will be about this)."

FORTHCOMING EVENTS

(*Meetings marked with an asterisk * are open to the public*)

Monday, March 7

Society of Engineers (at the Geological Society, Burlington House, Piccadilly, London, W 1), at 5 30 p m—Dr W E Ripper "Spraying of Crops by Helicopter"

Society of Chemical Industry, London Section (at the Chemical Society, Burlington House, Piccadilly, London, W 1), at 6 30 p m—Mr J Wright "Utilization of Fission Product Radiation"

Royal Institute of Chemistry, London Section (joint meeting with the Woolwich Polytechnic Scientific Society, at the Woolwich Polytechnic, London, S E 18), at 7 30 p m—Mr L C Nickolls "Some Chemical Aspects of Forensic Science"

Royal Geographical Society (at 1 Kensington Gore, London, S W 7), at 8 30 p m—Mr Merlin Minshall "Sailing Across Europe"

Tuesday, March 8

Institution of Post Office Electrical Engineers (at the Institution of Electrical Engineers, Savoy Place, Victoria Embankment, London, W C 2), at 5 p m—Mr J W McPherson "Some Non-Linear Magnetic Devices and their Application to Telecommunications"

Zoological Society of London (at the Zoological Gardens, Regent's Park, London, N W 1), at 5 p m—Scientific Papers

Institution of Civil Engineers (at Great George Street, Westminster, London, S W 1) at 5 30 p m—Mr D R R Dick "The Civil Engineer and Britain's Atomic Factories".

University of London (in the Meyerstein Lecture Theatre, Westminster Medical School, Horseferry Road, London, S W 1), at 5 30 p m—Academician W A Engelhardt (U S S R) "Mechano-Chemistry of Muscle" * (Further lecture on March 16)

Institution of the Rubber Industry, London Section (joint meeting with the Plastics Institute, at the "Oversea" League, Park Place, St James's, London, S W 1), at 7 p m—Dr A Charlesby "Changes in Rubber-like Materials by Exposure to High Energy Radiation"

Wednesday, March 9

Institute of Petroleum (at 26 Portland Place, London, W 1), at 5 30 p m—Mr L Grunberg "The Viscosity of Liquid Hydrocarbons" *

Institution of Electrical Engineers, Radio Section (at Savoy Place, London, W C 2), at 5 30 p m—Dr P E Axon, Mr C L S Gilford and Mr D E L Shorter "Artificial Reverberation"

University of London (in the Anatomy Theatre, University College, Gower Street, London, W C 1), at 5 30 p m—Prof T M Sonneborn (University of Indiana) "Paramecium in Modern Biology" * (Further lectures on March 10 and 11)

University of London (in the Physiology Theatre, University College, Gower Street, London, W C 1), at 5 30 p m—Dr C R Skoglund (Stockholm) "The Functional Organization of Spinal Interneurones" * (Further lecture on March 11)

Illuminating Engineering Society (at the Royal Institution, Albemarle Street, London, W 1), at 6 p m—Sir Harold Spencer Jones, F R S "The Brightness of the Stars" (Third Trotter-Paterson Memorial Lecture)

University of London (in the Beveridge Hall, Senate House, London, W C 1), at 6 p m—Sir Henry Tizard, F R S "A Scientist In and Out of the Civil Service" * (Haldane Memorial Lecture)

Society of Chemical Industry, Food Group (in the Rooms of the Chemical Society, Burlington House, Piccadilly, London, W 1), at 6 30 p m—Dr E C Barton-Wright "The Problem of Protein Haze in Bottled Beer", Dr E H Callow "Factors Affecting the Water Content of Meat"

Thursday, March 10

British Society for the History of Science, Philosophy of Science Group, Northern Branch (at the University, Nottingham), at 4 30 p m—Dr J O Wisdom "Is the Philosophy of Science a Science ?"

Physical Society, Low Temperature Group (in the Science Museum Lecture Theatre, Exhibition Road, London, S W 7), at 4 30 p m—Dr G G Haselden "Some Experimental Problems Encountered in the Fractionation of Liquid Air"

Institute of Fuel (at the Institution of Civil Engineers, Great George Street, London, S W 1), at 5 30 p m—Dr W Gumz "Fuel Developments in Germany" *

Royal Meteorological Society (in the Conference Hall, County Hall, Westminster Bridge, London, S E 1), at 5 30 p m—Mr F Ludlam "Clouds" * (Meeting open to Sixth-form Scholars)

University of London (at King's College, Strand, London, W C 2), at 5 30 p m—Prof P M S Blackett, F R S "War and Scientific Development" * (Last of a series of lectures on "War and Society")

University of London (at Senate House, London, W C 1), at 5 30 p m—Dr P Karrer (University of Zurich) "Curare-Alkaloids" * (Further lecture on March 11)

Institution of Mechanical Engineers, Industrial Administration and Engineering Production Group (at 1 Birdcage Walk, Westminster, London, S W 1), at 6 45 p m—Discussion on "The Engineer as an Administrator"

Royal Institute of Chemistry (joint meeting with the West Ham College of Technology Chemical Society, at the West Ham College of Technology, Romford Road, London, E 15), at 7 p m—Prof H J Emeléus, F R S "Fluorine".

Friday, March 11

Bedson Club (in Lecture Theatre I, New Chemistry Building, King's College, Newcastle upon Tyne 1), at 5 30 p m—Prof F J W Roughton, F R S "Rapid Reactions of Hæmoglobin with Oxygen and Carbon Monoxide" (99th Bedson Lecture)

South Place Ethical Society (at Conway Hall, Red Lion Square, London, W C 1), at 7 30 p m—Lord Boyd-Orr, F R S "Ethics in the Atomic Age" (Conway Memorial Lecture)

Royal Institution (at 21 Albemarle Street, London, W 1), at 9 p m—Sir Arnold A Hall, F R S "Experimental Techniques Used in Aeronautical Research and Development"

Saturday, March 12

Nutrition Society (at St Mary's Hospital Medical School, London, W 2), at 10 45 a m—Symposium on "Alcohol and its Nutritional Significance"

APPOINTMENTS VACANT

Applications are invited for the following appointments on or before the dates mentioned

Lecturer (with a good honours degree or Associate of the Royal Institute of Chemistry, and with research and/or industrial experience) in Chemistry, and a Lecturer (with a good honours degree or Associate of the Institute of Physics, and with research and/or industrial experience) in Physics, at the Technical College of Monmouthshire, Crumlin, Newport—The Director of Education, County Hall, Newport, Mon (March 12)

Senior Research Officer (with a degree in agricultural science or science of an Australian university, or of an overseas university of equivalent standing, or equivalent qualifications which should include a university degree supported by special postgraduate experience in research and/or teaching in plant pathology), in the Plant Quarantine Section, Department of Health, Canberra, for research and investigation into matters affecting plant quarantine involving liaison and co-operation with appropriate institutions and technical workers in Australia—Chief Commonwealth Medical Officer, Australia House, Strand, London, W C 2 (March 19)

Assistant Experimental Officer (male) (graduate in botany or agricultural botany, with training in plant physiology and preferably some knowledge of modern methods of field experimentation), in the Botany Department to help in field work on the physiological analysis of growth and yield of agricultural crops, and in related laboratory work—The Secretary, Rothamsted Experimental Station, Harpenden, Herts, quoting "102" (March 21)

Chair of Zoology at the University College of the West Indies—The Secretary, Inter-University Council for Higher Education Overseas, 1 Gordon Square, London, W C 1 (March 21)

Lecturer (with a good honours degree or equivalent qualification in mechanical engineering, and with practical experience in industry and in teaching) in Mechanical Engineering—The Principal, Wigan and District Mining and Technical College, Wigan (March 21)

Senior Lecturer or Lecturer in Physiology at the University College of the West Indies—The Secretary, Senate Committee on Colleges Overseas in Special Relation, University of London, Senate House, London, W C 1 (March 21)

Research Assistant (preferably with an honours degree in medical sciences or biology, and a knowledge of German) in the Department of Anatomy, for work mainly on the central nervous system—The Secretary, University College, Gower Street, London, W C 1 (March 26)

Research Assistant (with a first- or good second-class degree in botany, with ecological and physiological interests) in Ecology—The Secretary and Registrar, The University, Southampton (March 26)
